zle, paying special attention to having the line level, by using the spirit level. While this was going on, the work of a few moments only, the arm was thoroughly scrubbed out with a sharp brush, but without removing it from the rest, so that whatever of barrel buckling or "whipping-down" of the muzzle which might have affected the trial shots was not disturbed in making the final test shots. While the screens were being adjusted, too, the notes were taken of the weather conditions from the fine instruments sent us for the test by Gall & Lembke, of this city. All was now ready for the first shot. When it had been fired the hole or puncture in each screen was marked No. 1, as was the bullet hole in paper target. As the markers stepped aside a second shot was fired, and this in turn was marked No. 2 on each screen and on the target, and so on to the end, each shot passing through the screens and target, until five had been recorded. The screens had not been disturbed, neither had the target paper. A slight lateral motion was given the rifle in order to prevent the holes being too closely bunched on the screens and on the target. This lateral shifting was done in any case where the shooting seemed to be too close, and it may be mentioned to the general credit of the rifles all in the test that there were but one or two instances where it was not necessary.

With the firing of the last shot Mr. Sinclair took up his gauge, and, putting in the plug, verified his muzzle measurement; then on the first screen the distance from the surveyor's stake below to the fine ink line was taken and recorded, at the same time an eye being directed to the question of the correctness of the level set by the assistant. The next screen and the next were similarly treated and recorded, and at the target the distance from the stake to the line across the center of the bullseye was taken and put down at once in the notebook. In other words, we have now got on record the distance of a certain fixed line on each screen and on the target from a known level. This level having been determined in the first place by Charles H. Haswell and verified later in the trials by Surveyor Meserole. The figures as they appeared upon the notebook were:

Height of center of bore at muzzle	16.442 in.
Height of line on 25-yard screen	16.304 in.
Height of line on 50-yard screen	16.356 in.
Height of line of 50-yard screen	16.256 in.
Height of line on target	17.062 in.

The screens were then cut from the frames, and after the field work was over, they were tacked down on a smooth table and the heights of the centers of the bullet holes taken in a line at right angles with the line on screen. Let us follow shot No. 1—on screen at 25 yards it stood 3.256 inches above line; on screen at 50 yards it measured 4.576 inches above line; on the 75-yard screen it measured 5.162 inches, while on the target it struck 2.692 inches above the center line. Now with these figures it will at once be seen that every element and factor necessary to the determination of the trajectory curve is present. The proper way is to start at zero at the muzzle, and with a corresponding zero at the target get a line connecting them and then find the heights of the bullet holes in the screens above that line. So far as the screens are concerned, by adding together the height of the line and the height of the bullet hole above the line, we get the distance of the hole above the surveyor's level line, and by subtracting the muzzle height we get the distance of the bullet hole above the muzzle.

This calculation would take this form:

	25 Yards.	50 Yards.	75 Yards
Height of screen line	16.304 in.	16.356 in.	16.256 in.
Height of bullet hole	3.256 in.	4.576 in.	5.162 in.
	19.560 in.	20.932 in.	21.418 in.
Muzzle height	16.442 in.	16.442 in.	16.442 in.
Bullet hole above muzzle	3.118 in.	4.490 in.	4.976 in.

Now these would be the trajectory heights if the zero point at target, that is the point where the bullet struck, corresponded exactly with the zero point at the muzzle, that is the height of the muzzle, but the bullet struck 2.692 inches above the line on the target, which, as we have seen, stood at 17.062 inches above the base line. The calculation now is to find the difference in height between the point where the bullet started and the point where it struck, and the figures stand:

Line on target	17.062 in.
Bullet hole above line	2.692 in.
	19.754 in.
Muzzle height	16.442 in.
Bullet above muzzle	3.312 in.

The problem now is to distribute this 3.312 inches of height along the screens. It is manifest that the figures we have found from the screens are deceptively high. We need a new base line, from the muzzle to the hole on target, and not from the muzzle to the center line of target. This is shown on Fig. 1.

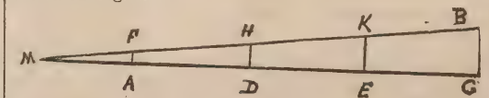

Fig I

M is the muzzle. C same level on target. B the point struck. C B is the 3.312 inches we have determined. A simple geometrical problem tells us that at A, where the 25-yard screen is, the height A F will be one-quarter of the height C B. At D, where the 50-yard screen is located, the height D H is half of the height C B, and at E, where the 75 yard screen is located, E K is three-quarters of C B. In actual numbers the record stands:

C B=3.312 in.
A F=¼ of C B=0.828 in.
D H=½ of C B=1.656 in.
E K=¾ of C B=2.484 in.

Going back to our first table, we are now able to complete it, as follows:

	25 Yards.	50 Yards.	75 Yards.
Height of screen line	16.304 in.	16.356 in.	16.256 in.
Height of bullet hole	3.256 in.	4.576 in.	5.162 in.
	19 560 in.	20.932 in.	21.418 in.
Muzzle height	16.442 in.	16.442 in.	16.442 in.
Bullet hole above muzzle	3.118 in.	4.490 in.	4 976 in.
Target correction	—0.828 in.	1.656 in.	2.484 in.
True trajectory	2.290 in.	2.834 in.	2.492 in.

This then is the record of one round through the three screens, and we hope we have made it plain enough to be understood by any one.

Shot No. 2, it will be seen, struck the target about the center line, and without doing more than giving the figures the calculation blank shows, as follows, the screen lines and muzzle height and target line remaining as before: At 25 yards the bullet went 2.586 inches above screen line, at 50 yards it was 3.312 inches, and at 75 yards it stood at 3 115; while on the target it struck .008 above the center line inscribed there, which, it will be recalled, stood 17.062 inches above surveyor's line. The calculations then stand:

	25 Yards.	50 Yards.	75 Yards.
Height of screen line	16.304 in.	16.356 in.	16,256 in.
Height of bullet hole	2.586 in.	3.315 in.	3.115 in.
	18.890 in.	19.671 in.	19.371 in.
Muzzle height	16.442 in.	16.442 in.	16.442 in.
Target correction	—0.157 in.	0.314 in.	0.471 in.
True trajectory	2.291 in.	2.915 in.	2.458 in.

In shot No. 3 we find the screen heights to be at 25 yards, 2.103 inches; at 50 yards, 2.224 inches; at 75 yards it was 1.453 inches, and at the target it struck 2.248 inches *below* the center line. This last will necessitate a reversal of our geometrical diagram, as follows:

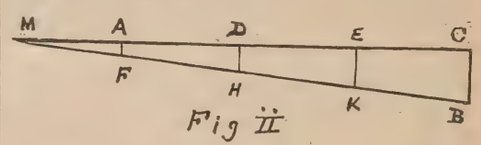

Fig II

The lettering is the same and the same principle applies, but the line of heights first obtained on the screens are plainly too low and need to be increased as the bullet hole is brought from its actual position below the muzzle to a point above it, and the table stands:

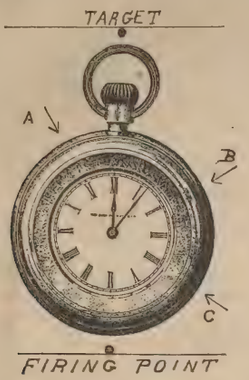
	25 Yards.	50 Yards.	75 Yards.
Height of screen line	16.304 in.	16.356 in.	16.256 in.
Height of bullet hole	2.103 in.	2.224 in.	1.453 in.
	18.407 in.	18.580 in.	17.709 in.
Muzzle height	16.442 in.	16.442 in.	16.442 in.
Target correction	+0.407 in.	0.814 in.	1.221 in.
	2.372 in.	2.952 in.	2.488 in.

Shot No. 4, when examined on the screens and target, was found to show heights as follows above the ink lines: 25-yard screen, 2.753 inches; 50-yard screen, 3.556 inches; 75-yard screen, 3.465 inches, and target, 0.556 inches. In this case the bullet, striking above the muzzle height, there would be a correction to be made by subtraction, the figuring standing:

	25 Yards.	50 Yards.	75 Yards.
Height of screen line	16.304 in.	16.356 in.	16.256 in.
Height of bullet hole	2.753 in.	3.556 in.	3.465 in.
	19.057 in.	19.912 in.	19.721 in.
Muzzle height	16.442 in.	16,442 in.	16.442 in.
Target correction	—0.294 in.	0.588 in.	0.882 in.
True trajectory	2.321 in.	2.882 in.	2.397 in.

The fifth and last round, it will be seen by the target diagrams, strikes below the center line, and in this respect resembles No. 3; and a similar mode of reaching the result is followed. The screen and target measurements were: 25-yard screen, 2.406 inches; 50-yard screen, 2.804 inches; 75-yard screen, 2.366 inches; and on the target 0.960 inch below, and the calculation stands:

	25 Yards.	50 Yards.	75 Yards.
Height of screen line	16,304 in.	16.356 in.	16.256 in.
Height of bullet hole	2.406 in.	2.804 in.	2.366 in.
	18.710 in.	19.160 in.	18.622 in.
Muzzle height	16.442 in.	16.442 in.	16.442 in.
Target correction	+0.085 in.	0.170 in.	0.255 in.
True trajectory	2.353 in.	2.888 in.	2.435 in.



All that now remains is to join these shots into a table to get the average for the five shots; and, to make it more complete, we insert what is omitted, as understood, in the report on each arm, the zero point which we have found for muzzle and target:

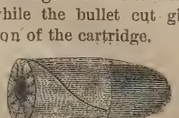
Round.	Muzzle.	25 Yards.	50 Yards.	75 Yards.	Target.
1	0	2.290 in.	2.834 in.	2.492 in.	0
2	0	2.291 in.	2.915 in.	2.458 in.	0
3	0	2.372 in.	2.952 in.	2.488 in.	0
4	0	2.321 in.	2.882 in.	2.397 in.	0
5	0	2.353 in.	2.888 in.	2.435 in.	0
Average		2.325 in.	2.894 in.	2.454 in.	

The nomenclature of the wind seems to be, judging from letters of inquiry received, not clearly understood by all of our readers; and when we speak of a "10 o'clock" or a "6 o'clock" wind, the terms convey to the mind of some of our readers an impression of the actual direction in which the wind was blowing. It would be plainly out of the question to use the points of the compass in describing the direction of the wind, unless we had for constant reference a map of the range. In fact the firing during the tests was almost

due north; but we have in all cases used the regular terms employed at Creedmoor, and we think on most of the American ranges, in describing the wind.

We must suppose that the observer is standing at the firing point facing the target, and that he has in his hand a watch lying face upward, with the 12 o'clock mark toward the target.

Then a wind blowing in the direction of the Arrow A would be called an 11 o'clock wind, as coming from the quarter marked by the figure 11 on the dial. Arrow B will represent a 2 o'clock wind, and arrow C a 4 o'clock wind, and so on for each of the twelve divisions of the dial. A wind coming direct from the target toward the shooter would be 12 o'clock wind, and if it had a habit of shifting first to one side of the meridian and then to the other, it would be a "fish tail" wind. A similar fish tail wind might come from the rear, and would then be a 6 o'clock fish tail wind. With the direction and the force of the wind given, all is noted that it is necessary to know of the wind part of the atmospheric conditions.



It will be seen that this same device of a dial may be made use of in noting the point hit by a bullet on the target. In this case we must suppose the watch to be hanging on the target face. So a 12 o'clock bullseye would be one near the top, and a 6 o'clock bull would be one near the lower part of the bullseye. So also of inners, and centers, and outers, they could all be accurately and tersely described by this dial nomenclature.

Bland .45, Double Barrel.

The English express rifle came to the test from Thomas Bland & Sons, through Major W. H. Merrill, to whom it had been sent for testing purposes by the makers. It was said that it was the identical rifle employed in the *Field* trial of two years ago, and about the results of which so much discussion had followed. The arm reached the range on Sept. 29. and was brought by Mr. G. J. Romer, on behalf of Maj. Merrill. In appearance it looked rather light for such heavy charges to which it was subjected and for which it was chambered. The weather conditions at the time of the 200-yard test, on the afternoon of the day named, were very favorable, the wind was from the 7 o'clock quarter, blowing seven miles per hour, the barometer stood 30 150 inches, the dry thermometer at 75°, and the wet-bulb thermometer at 68.5°, making a dew point of 64.5 and the humidity 70 per cent. The weapon weighed eight pounds thirteen ounces and the barrels alone when disconnected from the stock five pounds eight ounces, the barrel length being twenty eight inches. The twist appeared to be uniform with six grooves, making one turn in thirty-six inches. The groove base was not concentric with the bore of the weapon but was of peculiar shape, deep in one side and slight in another, being the ratchet groove. It would average about .007 inch in depth, while in width it was about .20 inch. The shop number on the arm was 10,123. It was loaded with ammunition brought by Mr. Romer and said by him to have been sent over with the arm. They were Eley Brothers cartridges, marked on the back of the cartridge head "Eley express, No. 1," and the bullet a solid one with patch, was marked with a small M on the base. The powder was Curtis & Harvey, No. 6, and one of the cartridges when turned out for measurement showed the powder in fine condition with a 310.1 grain bullet and 113.3 grains of powder.

It is impossible to say what the bullet composition is as no test was made of it. The arm is of the tip-up shotgun pattern, and no small trouble was met in getting it so fitted to the rest that the muzzle height could be taken with exactitude at each discharge. The cut will show the size of cartridge used, while the bullet cut gives the size and shape of that portion of the cartridge.

In numbering the shots care was taken to note the right hand barrel shots from those of the left-hand barrel. The right hand barrel was in each case fired first, followed by the other barrel, making the odd-numbered shots belong to the former and the even-numbered ones to the latter. The right-hand barrel record stood as follows:

Round.	50 Yards.	100 Yards.	150 Yards.
1	5.017 in.	7.236 in.	5.720 in.
3	4.544 in.	7.250 in.	5.519 in.
5	5.023 in.	7.635 in.	5.965 in.
9	5.160 in.	7.778 in.	6.141 in.
Average	**4.936** in.	**7.475** in.	**5.836** in.

Of course the conditions in every respect were the same for the other barrel, whose record stood:

Round.	50 Yards.	100 Yards.	150 yards.
4	4.901 in.	6.941 in.	5.242 in.
6	5.450 in.	7.932 in.	5.959 in.
8	4.993 in.	7.378 in.	5.914 in.
10	5.199 in.	8.093 in.	5.885 in.
Average	**5.136** in.	**7.586** in.	**5.750** in.

The average of both barrels and for the rifle gives us:

	50 Yards.	100 Yards.	150 Yards.
Right barrel	4.936 in.	7.475 in.	5.836 in.
Left barrel	5.136 in.	7.586 in.	5.750 in.
	5.036 in.	**7.530** in.	**5.793** in.

It will be seen that the two barrels are very uniform in results, and at the subsequent tests at 100 yards the right-hand barrel only was used. This enabled closer grouping on the screens and targets, while it did not work any disadvantage to the gun or trial.

Mr. Romer came again with the bag in which the Bland was tucked away on Oct. 12, and about 11 o'clock in the morning it was put to the test. He complained that the gun had shown signs of weakness after taking from the rest on the 29th ult.; at least when he got home he found the upper tang which fastens the metal work of the arm to the wooden part of the stock had sprung; he had accordingly constructed a special rest in which wooden clamps were closely fitted over the barrel at two points, they in turn fastened to a thin metal plate, which slid in grooves or guides, fastened to a broad base. With this contrivance, very simple and ingenious, and very quickly fitted, we were enabled to get the measurements of the muzzle at the moment of pulling the trigger, while the arm was free to follow the natural motion of recoil, and slide back to be grasped by the hand of the firer. In noting the figures made under these conditions, due allowance must be made for whatever advantage this system of rest may be thought to afford the weapon under trial.

The weather observations at the time of this 100-yard trial of the Bland showed a barometer of 30.320 inches, dry thermometer 59.5°, wet-bulb thermometer 55°, dew point 50.5° and humidity 72 per cent. The wind was coming from the 7 o'clock quarter at 12 miles an hour velocity. The cartridges for this test were from a lot of express-bullet ones sent over from the Eley cartridge works to a gun shop in this city and which after much inquiry we were fortunate enough to get. Mr. Romer had used up most of the original supply of bullets, and though he had shells and powder to reload, it would have been necessary to send to England for bullets, and the time for this we could not afford. The purchased lot turned out to be very excellent ones; they were in cartridge shells marked as before—"Eley No. 1 Expr."—and three of them turned out the powder in fine condition, the bullets were patched and had the usual hollow point covered in with a brass lid. This inserted tube of brass has a rounded point corresponding with the outline of the bullet. Three charges when weighed showed powder weights of 111.8, 112.4 and 112 grains, and corresponding bullets of 277.4, 277.7 and 277.2. This would give the very high proportions of nearly 1 to 2, and of course very swift moving bullets and low trajectory was the rule. Mr. Romer, as an old rifleman, did not take kindly to the idea of shooting patched bullets through a dirty barrel, so the first five rounds after the sighting shots were fired with the swab passed through the barrel after each round. The record stood:

Round.	25 Yards.	50 Yards.	100 Yards.
1	1.278 in.	1.429 in.	1.283 in.
2	1.330 in.	1.546 in.	1.378 in.
3	1.308 in.	1.615 in.	1.169 in.
4	1.150 in.	1.376 in.	1.364 in.
5	1.219 in.	1.368 in.	1.329 in.
Average	**1.257** in.	**1.686** in.	**1.304** in.

Now we said, as this is a test of hunting rifles and a hunting rifle ought to be one capable of reasonably long use without cleaning, we will fire five trial shots without cleaning. This was next done and the record of this test stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.146 in.	1.373 in.	1.298 in.
2	1.159 in.	1.304 in.	1.247 in.
3	1.219 in.	1.415 in.	1.352 in.
4	1.270 in.	1.364 in.	1.301 in.
5	1.084 in.	1.216 in.	1.217 in.
Average	**1.175** in.	**1.334** in.	**1.283** in.

Out from the recesses of his shooting trap box Mr. Romer fished a half dozen cartridges. They were some which he had himself loaded with C. & H. No. 6 powder and some of the same bullets as before mentioned in the 200-yard test. One cartridge taken and opened showed 107.5 grains of powder in fine condition behind a 309.7 bullet and jute wad between. The wind by this time had increased in force until it was recorded as blowing 23 miles per hour, but from the same quarter. The record of the five shots showed:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.082 in.	1.399 in.	1.215 in.
2	1.140 in.	1.557 in.	1.383 in.
3	0.964 in.	1.328 in.	1.215 in.
4	1.132 in.	1.544 in.	1.355 in.
5	0.944 in.	1.222 in.	1.248 in.
Average	**1.052** in.	**1.410** in.	**1.283** in.

We regretted that we we were not able to make more exhaustive tests with this imported arm of a class for which so much is claimed and which are held in such high esteem. Had not the supply of shells been expanded by the tests already made we should have liked to load a few with the naked bullet made for them and fired a set of test shots. This grooved bullet is shown in the cut, and if report be

true, is a very low-shooting, hard-hitting one, but with such a charge of such quick-burning powder it could hardly be otherwise.

Wesson .44, Rim-Fire.

This arm is the first of those using the rim-fire cartridge, and the only one in the trial of the .44 caliber. We have seen what the .50 caliber weapons were capable of; also an interesting group of .45; and now we come to a solitary example of the caliber so popular among the small-bore, long-range rifles at one time. The form of this old-time well-known rifle is familiar to all, with its tip-up barrel, which made it a very unhandy one for placing in the rigid rest we had in use. It did not come from the factory of Mr. Wesson, as repeated letters had failed to bring a response in the form of an express package containing a rifle. We accordingly sent to the shop of Mr. Henry C. Squires, 178 Broadway, and selected from his stock a Wesson for the trial. The ammunition also was procured there. The arm weighed 8 pounds 6 ounces, had an octagonal barrel 30½ inches long, and was marked 4455 in the shop. It was loaded with Union Metallic Cartridge Company's ammuni-

tion of the .44-28-214 pattern. Three rounds opened showed the FG powder in fine condition and a pure lead bullet with one groove. The powder weights of the three charges were 27, 28.9 and 28.5 grains, while the three corresponding bullets were 213.9, 214.2 and 214.8 grains in weight.

The 200-yard test was made on Sept. 30, at 3 o'clock in the afternoon, with the barometer at 30.02 inches, the dry thermometer at 77.2, the wet-bulb thermometer at 66.5, making the dew point 59 and the humidity 54 per cent. The wind came from the 6 o'clock quarter at 16 miles per hour.

The record at this range stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1	14.496 in.	19.981 in.	15.101 in.
2	13.568 in.	18.755 in.	14.297 in.
3	13.419 in.	18.224 in.	13.885 in.
4	14.021 in.	18.904 in.	14.419 in.
5	14.393 in.	20.201 in.	15.442 in.
Average	**13.979** in.	**19.213** in.	**14.628** in.

It was not until Oct. 12, at 3 o'clock P. M., that the arm was put on for the 100-yard test. The wind was coming then from the 8 o'clock quarter at 16 miles per hour. The barometer indicated 30.320 inches, the thermometer 53.5, the wet-bulb thermometer 50.5, giving the dew point 47.5 and a humidity of 80 per cent. The ammunition was as before, and the trial showed:

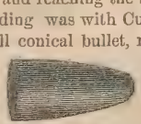
Round.	25 Yards.	50 Yards.	75 Yards.
1	3.535 in.	4.651 in.	3.773 in.
2	3.608 in.	4.584 in.	3.690 in.
3	3.127 in.	4.124 in.	3.499 in.
4	3.603 in.	4.536 in.	3.793 in.
5	3.624 in.	4.768 in.	3.898 in.
Average	**3.499** in.	**4.532** in.	**3.730** in.

Merrill Muzzleloader.

We have styled this the Merrill muzzleloader because it was owned and furnished by Major W. H. Merrill, with whom, as a writer on the question of muzzle vs. breech and other topics connected with the science of rifle shooting, our readers are already well acquainted. The weapon was made by E Phillip, once well known in New York, and was brought and fired by Mr. G. J. Romer, and we are sorry that it was put through the 200-yard test only. It was, we are informed, the special desire of the Major that it should be tested at 100 yards, yet when at a later date we wrote to Mr. Romer, the Major being then in the West, to come down for the 100-yard firing, another muzzleloader was brought from the private arm collection of Mr. Romer.

The Merrill arm was a type of the old time weapon, when 40-rod shooting was considered the very highest form of the art of marksmanship. It weighed entire 11 pounds 6½ ounces, and had an octagonal barrel weighing 8 pounds 6 ounces. It was provided with set trigger, and had to be provided with telescopic sights before it was ready for firing. The barrel was 28 inches in length. The caliber was .42-inch and the rifling of the gain twist pattern, starting in at the breech

end with one twist in 72 inches, and finishing at the muzzle with the rate of one twist in 24 inches. There were 6 grooves, each .010 inches deep, and .105 inches in width. The loading was done in the ordinary way with a false muzzle, using a jute wad and an oiled skin patch for the bullet. The powder used was Curtis & Harvey No. 6, and two charges taken at random during the loading showed powder weights of 133 25 and 131.10 grains, while two of the conical bullets



taken at random out of the box weighed 267.2 and 267.3. They were cast in mould by Mr. Romer, using 20 parts lead to 1 of tin.

The weapon was tried at 200 yards on Sept. 29 from the rigid rest, with the wind coming from the one o'clock quarter at 4 miles per hour. The barometer stood at 30.150, the dry thermometer stood at 69°, the wet-bulb thermometer at 65.2°, making a dew point of 62.4 and the humidity 79 per cent. of saturation. Special care was taken with the measurements of the muzzle heights at each replacement of the weapon in the rest. Of course it was able to make a very close group of shots on the target, but it will be understood that an accuracy test and a trajectory test are two utterly distinct matters, and that they ought to be carried on under different conditions. No one with any knowledge of the action of small arms under fire would for a moment think of getting a test of accuracy from a rigid rest, while for a trajectory test, where it is essential to have a zero point on the muzzle at the moment of firing, something in the form of a rest which will secure that is absolutely necessary. Sandbags and a good marksman come into play where accuracy is needed, but for trajectory, as long as the bullets pass through the screens and reach the target we have all that is needed to calculate the trajectory height. Any attempt to unite the two in the same round must of course be futile. In such a case as the present the inch broad black patch on the 50-yard screen might easily have been hit with each shot, almost any rifle in the trial would have done that, but here as in other cases, the aim was purposely held off in order that clear and separate punctures in the screens might be made and readily noted and easily measured. The record of the Merrill rifle stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1.....	4.333 in.	6.453 in.	4.997 in.
2.....	4.392 in.	6.492 in.	5.046 in.
3.....	4.342 in.	6.213 in.	4.876 in.
4.....	4.564 in.	6.504 in.	5.071 in.
5.....	4.363 in.	6.335 in.	4.977 in.
Average.....	**4.499** in.	**6.399** in.	**4.993** in.

Romer Muzzleloader.

This weapon is named, as was the last, after the gentleman who brought it to the test; but in this case it was the maker as well. The rifle came down on Oct. 12, when the Bland was brought for the 100-yard trial, and had a 100 yard test only. It was a ponderous weapon, weighing, complete, 14 pounds 2 ounces, and with a 27-inch octagonal barrel, in which there was 11 pounds 12 ounces of metal. The caliber was .42 inch, and with six grooves, each .010 inch deep and .105 inch wide. The twist was gain, starting in at 72 inches to the turn and reaching the muzzle at 24 inches to the turn. The loading was with Curtis & Harvey's No. 6 powder and this small conical bullet, mould-cast by Mr. Ro-

mer of 20 parts lead to 1 of tin. The powder charge weighed 98.5 grains, while two bullets weighed up respectively to 212.7 and 213.1 grains. It was loaded as was the Merrill weapon, and, like it, had set trigger and telescopic sights. It was not put in the iron rest, but was provided with the barrel-grasping clamp and fired in such way from a dead rest that at each discharge it was free to slide in recoil. It was, in fact, tried as was the Bland, at 100 yards, and the same allowance, if any, must be made in judging its results. When tried it was about 2 o'clock on the afternoon of Oct. 12. The barometer stood at 30.300 inches, the dry thermometer at 58°, the wet-bulb ditto at 54°, making, by calculation, a dew-point of .50 and a humidity of 75 per cent. The wind at the time came from the 5 o'clock quarter at the rate of 18 miles per hour. With such a charge from such a weapon the shooting was, of course, very accurate, and a very flat line of fire is shown as follows:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	1.180 in.	1.373 in.	1.270 in.
2.....	1.239 in.	1.498 in.	1.205 in.
3.....	1.033 in.	1.399 in.	1.419 in.
4.....	1.170 in.	1.051 in.	1.051 in.
5.....	1.031 in.	1.210 in.	1.421 in.
Average....	**1.130** in.	**1.306** in.	**1.273** in.

A Steamboat Squeeze.—The steamer Wakefield plies between Washington and lower river landings. On returning from a hunting trip to King George county, Va., we took passage on her to Washington. Having had bad weather our amount of game was small, not exceeding thirty pounds. On this they collected fifty cents. This is about on a par with the B. & P. R. R. folks, who charge for dogs. Two birds were abstracted from the strings. In all other respects the boat was first-class and deserves the patronage of sportsmen.—Walter Scott.

HUNTING THE MOUTAIN GOAT.

THE following account, from a late issue of the *Iowa State Register*, has additional interest because of recent discussions of the goat and goat hunting:

"Mr. Edward H. Litchfield, of New York, is in the city attending to some private businesss connected with the Litchfield land grants. He is but just returned from an extended hunting jaunt in the Rockies, and knowing that he always had something of interest to relate, a *Register* reporter called upon him at the Kirkwood yesterday. Mr. Litchfield is a pleasant gentleman still young in years, with an engaging address and unusual conversational powers. He is an enthusiastic hunter and tells of his experiences most delightfully. In response to a question as to the trip just finished he said:

" 'For a number of years it has been my custom to spend my vacation in hunting, sometimes one place, sometimes another, but every year I manage to spend at least one month under canvas. This year when I was ready to start it was too late to find bear in the headwaters of the Yellowstone, and I then thought of spending the time among the mountains of Arizona. But the Apaches were on the war path at the time, and the Indian Commissioner prevailed upon me to essay some other field. I was advised that mountain goat could be found in the high mountains of northwestern Montana, and as they are the rarest of American game, and I had long before determined to have at least one if it took a trip to Alaska to procure it, my course was immediately planned in that direction. Mr. C. W. Puffer, one of our best known and most successful guides, accompanied us. At Missoula, Montana, we procured our outfit, and four men strong, with nine horses, we started across country for the land of the goat. We traveled for seven consecutive days, crossing the Big Black Foot and the Rockies, until we were two days' ride beyond the known country, in a land but seldom visited by a white man, and then only by some lone trapper or hunter seeking those spots where game had never been taught to fear. All the way we passed through the most magnificent scenery, some of it rivaling in beauty and grandeur any the world can offer. The mountains are high and rugged, and with their tips of snow impart a stern majesty to every scene which defies description. Then the water in that country has a peculiar green cast which, especially when the observer is looking down upon it from a great altitude, produces the most brilliant effects. The Rocky Mountain goat, as I said before, is the rarest and at the same time the most difficult of all American game to capture. But a very few stuffed specimens are known in the entire world, and but very few sportsmen have ever had the distinction of killing one. The mountain sheep is quite abundant in some localities and is sometimes mistaken for the goat, though they differ widely in appearance and habits. The goat is snow white and has short cylindrical black horns, while the sheep is almost brown in color and has long curved horns, so that the two need never be confused. The reasons of its being so difficult to kill are its scarcity and the fact that it inhabits only the highest and most inaccessible mountain peaks, as far as possible from the haunts of man. The only way to get to them is to climb up the mountain as far as you can, then plant a ladder and continue climbing. The first point to be gained is to reach an altitude above their haunts, and then you can commence to hunt with some prospect of success.

" 'At the close of our seventh day's journey we pitched camp in a little valley, surrounded on every hand by ragged and almost precipitous peaks, and from which gulches radiated in every direction, leading skyward to the summits. It did not seem possible that man had ever desecrated this spot and we felt that at last the land of the goat was reached. The first day was spent in prospecting for signs, and in the afternoon we had the pleasure of seeing one of the very animals that long journey had been taken to obtain. He was standing about 500 yards distant from the party, and for some time I could not bring myself to believe it was not a white bear. The position in which he stood was such as to bring the high shoulders, drooping head and thick legs into strong relief, and the horns being invisible, the resemblance to that animal was certainly striking. Before we could get around in shooting distance he had taken our wind and packed his trunk for a quick trip home. Having satisfied ourselves as to the existence of mountain goats in that locality, upon which question I must confess to being skeptical before, we returned to camp burning with excitement and commenced making arrangements for the next day's hunt. Our breakfast the next morning was taken by starlight, and by sunrise we were well on our way to the summit. The horses were taken as far up the slope as possible and then we proceeded to zig zag our toilsome way to the top. The peak was what is known as a "hog back" or "knife edge" ridge, but a few feet in width on the top and dropping away for thousands of feet in a precipitous slope that affords but scanty footing to even the deer and goat. On either hand we could look down upon frozen lakes, and dotted here and there upon the mountain sides were patches of snow which had withstood the ravages of a July sun. As we proceeded along this narrow way the signs of the game we were seeking grew more plentiful until the excitement which always attends the presence of big game took almost painful possession of us. Suddenly we sighted a family group of seven white animals, the objects of our long journey, lying upon a little plateau a few hundred yards distant and below the ridge upon which we had been traveling. It was a glorious sight and one for which many a man had risked his life in times past. They were lying in a clump of short cedars, spread out upon the ground like the spokes of a wheel, their heads all turned so they could watch the valley below. It was with difficulty we could restrain our eagerness until a plan of battle could be formulated, but the question was one of supreme importance, and we could not think of failing when the wondrous game was at last in sight.

" 'After a consultation of some ten minutes a method of attack was adopted which fortunately brought about the very best results. The wind was blowing along the mountain side between us, which added somewhat to our difficulty. From what we knew of the habits of these animals we decided that when alarmed they would run up the mountain and with the wind. It was then determined that I should stalk down the mountain directly upon them and that Mr. Puffer should follow the ridge around to intercept their flight. A series of signals were determined upon by which he would keep me posted as to the movements of the game. It was growing late by this time, and to add to the urgency of the occasion, the sky had clouded and was threatening snow. Now a snowstorm in that altitude simply meant that we should be obliged to remain and grow up with the country, which was not a part of our original programme. I selected a clump of cedar behind which to hide and began to make the descent with the utmost care. Not only was this a difficult task, but it was also attended with considerable danger, as the slope was so steep that a misstep might start one valleyward upon an immense landslide, and then, if I rolled a pebble even down the mountain it might alarm the precious game. Slowly and carefully I let myself down the declivity, feeling much as a man must when hanging upon the side of some immense building, and finally reached the point chosen from which to commence the attack. Just then I received a sight message from Mr. Puffer to the effect that the game was in motion and working off toward my right. All this time I had not ventured to take a single look at the animals I had risked so much to secure, but now I stepped from shelter and sure enough there the whole family were filing majestically off as he had indicated. I glanced the group over hurriedly to pick the choicest specimen, but seeing no especial difference in the large ones, I chose the one presenting the best opportunity, and gave him a double 12 ball behind the shoulder and almost at the same instant the second barrel to No. 2. These shots threw them into the most complete confusion, and after some wild leaping about from point to point they banded together and swung round to look down into the valley below. This gave me a chance to reload, and just then one of the finest bucks stepped out in bold relief upon the edge of the plateau. A kid stood between him and me and I waited until it had stepped out of the way and then gave him a shot behind the shoulder. This report started them off in the direction of Mr. Puffer, and I just had time to take a snapshot at one as he went behind a clump of cedars. I had no hope of making a hit, but he dropped as had the other three, and two of them rolled down the precipice into the valley below. They presented a rather comical sight bounding down that long slope, but you may be sure it was extremely gratifying to me and I felt more than over-paid for all the worry and fatigue that the triumph had cost.

" 'The other two I could not see and had just started in search of them when I heard several shots from the direction of Mr. Puffer. I then started to see how the battle waged in his vicinity, and met him coming down to meet me. In answer to my anxious inquiries he said he had shot several, but could not tell how many. After passing mutual congratulations upon our wonderful success we climbed down the mountain to look after the wounded and dead. On the way down we started one that had been hit by Mr. Puffer, and I took a running shot at it with my revolver, but both of us were too thoroughly fatigued to attempt pursuit. On looking up the hill we saw another outlined against the sky, with all four legs pointing heavenward like an upturned stool. To all appearances he was as dead as was ever Julius Cæsar, but when Mr. Puffer approached to make sure of his decease he raises his head and began to show signs of flight. Another shot, however, settled his case most thoroughly, and he took the same erratic route to the bottom as had the others. On skinning him five mortal shots were found, one of which had been made by my double 12, showing the goat to be possessed of a tenacity of life scarcely second to that of a grizzly bear. All this had taken hours, and as we had left our lunch with the horses you can imagine our hunger. After one has climbed over steep mountains all day long, with nothing to eat or drink but snow, it is perfectly natural that he should be exhausted, and to cap it all, here we were with the heads and skins of these four animals to carry up out of this hole into which they had fallen, and there was no way out save by a climb. But we finally managed to reach the horses shortly after sunset, completely fagged out, but proud of our conquest. We had secured in one day's hunt four fine specimens of the Rocky Mountain goat, an animal so rare and difficult to obtain that the number of specimens is limited to less than ten for all the collections of the world, and if that is not a victory of which an amateur sportsman may be proud I would like to know what is.'

"Mr. Litchfield took a sketch of one of the goats from nature and will have the specimens mounted from that sketch. He already possesses one of the most valuable collections of hunting trophies in the world, and these will add to its value and interest in a wonderful degree."

LOADING FOR GAME.

MY experience has proved that for ducks and other game of similar nature and habits, a 10-gauge gun of about 10 pounds' weight and capable of using 1¼ ounces of shot and 4 to 5 drams of powder is decidedly superior to a smaller and lighter gun. Such gun should have 32 inches length of barrels, and an inch or two longer would be better for game at long range. Such a gun should not use powder finer than single F grain to do good shooting. Fine powder is too sudden in its action to use in a large gun, and subjects the joints to enormous strain and causes excessive recoil; but a 12-gauge may be shorter in length of barrels, say 30 inches, and a charge of 1¼ ounces of shot, with 3 or 3¼ drams of FFG powder, has given me the best of results, both as to pattern and penetration.

I have a 14-gauge breechloader, 28-inch barrels (double), weight 7¼ pounds, in which I use 2¼ drams Dupont's FFF powder and 1 ounce shot, and can say from experience that for everything it is the best gun I ever used. One ounce of shot is a good charge for almost any game except ducks, perhaps, and it therefore answers every purpose of a 12 or 16 gauge. Its shooting qualities are first-class, penetration splendid, No. 8 shot penetrating thirty leaves of "Patent Office Report" at 40 yards with 2¼ drams powder, so I agree with "Medium" in his opinion of the 14-gauge gun. Mine was originally a 16-gauge, and after giving it a fair trial I was satisfied that its shooting qualities would be improved by having the barrels chambered to take a 14-gauge shell, and I have seen no cause to regret it. The improvement is decided.

There is one point in regard to the proper length of barrels that is not easy to decide; but one thing is certain that the smaller the bore the shorter the barrels should be, but finer powder should be used in proportion; that is of such fineness as to agree with the cubic dimensions of the larger ones, a cannon of 10 or 12-inch bore and 35 feet long will use a powder, each grain of which is nearly an inch in diameter with the best of results, and we should learn from that fact how to choose powder of a proper grain and shot of a proper weight for our guns. I prefer ¾ inch drop as the gun comes right up to its proper place in sighting, though some short-necked shooters would prefer ⅝. I believe a 16, 18 or 20 gauge is too small for anything but still-hunting or to kill small birds with fine shot, and becomes more of a toy than weapon for general business. St. Lawrence.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in the past we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM'S constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This is the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table. We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

GOOD THINGS IN STORE FOR 1886.

Among the papers and sketches to appear are the following:

To the Walled-in Lakes.

Sketches of exploration and hunting in the Northwest with the Blackfeet and Kootenays. By "Yo."

Cruise of the Coot.

An account of a voyage alone in a single-hander from New York along the Atlantic seaboard to Florida. By C. P. KUNHARDT.

Hunting in the Himalayas.

Scenes and incidents in the life of an Indian forester. By "SHIKAREE."

Falcons and Falconry.

An introduction to the sport of hawking, with illustrations, drawn from nature. By R. W. SEISS.

Game Preserving in Britain.

A comprehensive series of papers on practical game preserving in Great Britain, with descriptions of the game birds of the British Islands, and sketches of sport. By "MOORMAN."

Scrimshawing.

A popular account of how a whaler spends the idle hours aboard ship. By JAS. TEMPLETON BROWN.

The Lower Forms of Life.

A continuation of the admirable series of essays on the beginning of animal life. By JAMES STOLLER.

Studies in Botany.

New chapters on plants and plant life, written and illustrated from nature. By A. W. ROBERTS.

Land and Water Experience in Florida.

New chapters of experience on the Gulf Coast. By "NESSMUK."

Cruise of the Pilgrim.

A delightful description of a summer voyaging on the Atlantic in the cutter yacht Pilgrim. By W. H. WINSLOW.

Days with the Barmacide Club.

A vivacious account of angling luck, good and bad, in Adirondack waters, whose name, latitude and longitude the author refuses to disclose. By MILLARD

Camps of the Kingfishers.

A further relation of what befel the Kingfishers in their sojourn at Carp Lake, Michigan.

Camp Flotsam.

A new series of the chronicles of the outers at Camp Flotsam, with accounts of bass fishing in Canadian waters. By WAWAYANDA.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

The Forest and Stream Publishing Co. will send post paid any book published on receipt of publisher's price.

Sportsman's Library.

List of Sportsman's Books

We will forward any of these Books by mail, postpaid, on receipt of price.

No books sent unless money accompanies the order.

POSITIVELY NO BOOKS EXCHANGED.

THE ITHACA GUN!

BEST ENGLISH TWIST BARRELS, $35.

DAMASCUS STEEL BARRELS, $50 to $200.

BAKER'S

Latest and Best Invention.

Strongest, simplest and best balanced gun made. All have Top Lever, Low Hammers, Rebounding Locks, Interchangeable Parts, Extension Rib, Self-Fastening Compensating Fore End, Rubber Butt Plate, and the shooting qualities that made the Baker Gun a great success. Send for Circulars.

ITHACA GUN CO., Ithaca, N. Y.

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞Illustrated price lists sent upon application. Address

H. M. QUACKENBUSH, Manufacturer, Herkimer, N. Y., U. S. A.

NOTE.—We stamp our name plainly on each gun we make. Send for catalogue B.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.
LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.

J. N. DODGE,
276 & 278 Division Street,
Detroit, Mich.

Manufacturer of Cedar Decoy Ducks of all kinds. First quality, $9 per doz.; second quality, $7 per doz.; third quality, $5 per doz. Also Geese, Brant, Swan, Coot and Snipe Decoys. Duck and Turkey Calls. Decoys made like any pattern furnished without extra charge.

St. Clair Flats Pattern, much larger than the bird; less than one-third the weight of solid decoys. The exact position of a duck on water at rest and unalarmed. The lightest and best decoys made. Heads in different positions; glass eyes, hollow and flat bottom. Do not require weighting to keep them upright. Painted the exact imitation of the natural bird. $15 per doz. Sold by all gun dealers, to whom I give a large discount. If your dealer does not keep them I will send, freight paid, on receipt of price. Illustrated price list free. I also make solid decoys after the Monroe Marsh Pattern, semi-flat bottom; price $11 per doz.

Send for Illustrated Catalogue of MEDALS FOR RUNNING, ROWING, SHOOTING, BICYCLING, Etc., and BADGES FOR POLICE, FIRE DEPARTMENTS, RAILROADS and others.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

THE FOREST AND STREAM PUBLISHING COMPANY takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the eld of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, DECEMBER 17, 1885.

VOL. XXV.—No. 21. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. General subscription agents for Great Britain, Messrs. Davies & Co., No. 1 Finch Lane, Cornhill, London, and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Newsdealers in the United Kingdom may order through Davies & Co. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

ANSWERS TO CORRESPONDENTS.

OUR GRIZZLY BEARS.

LAST Friday morning, bright and early, the expressman left on the Park Row sidewalk in front of the FOREST AND STREAM office, a great crate or cage, in which were two grizzly bear youngsters. They had come all the way from Northern Montana, whence they had been sent to the FOREST AND STREAM by Col. Joseph Kipp, of the Blackfoot Agency. The bears were not altogether strangers. A member of the staff of this journal had last August made the acquaintance of one of the cubs, having been one of three men by whose united exertion the brute—then a captive in a barn—had been relieved of his collar.

The cubs were captured last May by a Piegan Indian, whose civilized name is John. The Indian was hunting one day when he came upon a grizzly bear cub, which by the dexterous use of a lassoe he soon made his own. The squealing of the cub brought the mother rushing in hot haste to the rescue of her offspring. John, by a single lucky shot, killed the she bear, and then discovered the two more cubs of an unusual litter of three. With his prizes he returned to his cabin on Cut Bank Creek; and soon the young captives become quite tame, running about with the dogs, and seemingly quite resigned to their new surroundings. It was not long, however, before the three disappeared, and after a most vigilant quest, only two were recaptured. These subsequently came into the possession of Colonel Kipp, and were confined by him in an old log stable.

Grizzly bear cubs are healthy animals. They have good constitutions; and from cubs they all too soon develop into Old Ephraims. Col. Kipp, with an interest not altogether unmixed with solicitude and apprehension at the expansion of girth and the muscular development of his interesting pets, began to envy the man who had lost a bear. It was probably with strangely mingled emotions, prompted by his embarrassment at the possession of the growing bears and his high regard for the FOREST AND STREAM, that the Colonel finally decided to inclose the incipient monsters in a secure receptacle and ship them by express and so label them that they would be delivered in our editorial office in the heart of a great city. It is needless to say that the FOREST AND STREAM appreciated the gift. Our Bear Editor has lugged his rifle many a weary mile looking for bears, and it was glorious good fortune to find two grizzlies right at hand, without even the necessity of crossing a ferry to get within range of the game.

The bears were kindly received and tenderly cared for. We fed them several loaves of bread, and through the day they held a reception on the Park Row sidewalk, where thousands of pedestrians paid them their respects, and small boys past all reckoning poked fun and sticks at them. The bears took it all in good part. They also took in a collection of hats, cuffs and shreds of garments.

So soon as the necessary negotiations could be completed the grizzlies were sent up to the Central Park, where Superintendent Conklin has kindly consented to care for them, and where they may now be seen.

GAME IN THE NATIONAL PARK.

EVERY item of news which we publish in regard to the National Park emphasizes a recommendation that we have many times repeated. This is the need of more assistant superintendents for the Park. This year for the first time the game found in that region has been protected, and as a consequence of this protection it has gathered in great numbers within the Park. Assistant Superintendent Wilson's report, printed on another page, gives some idea of the numbers and the tameness of the elk when they are protected, and it is clear that with this region as a refuge this splendid game need never become extinct.

What is needed for this work is a superintendent—a head interested, energetic and capable, and under him a force of competent men acquainted with the country and with their duties.

To efficiently patrol so extensive a region as the Park requires a force much larger than the one now employed, and the failure to provide a sufficient number of police may result in serious injury to the forest through the spread of fires, or in wholesale slaughter of game.

Although there may be no very large number of either buffalo or antelope in the Park, the large game, taken altogether, is extremely abundant there.

Colonel Wear has taken hold of the management of the Park with a great deal of energy. Since he assumed charge of the reservation in July there have been arrested and convicted the following individuals: Geo. Reader, fine $100 and six months in jail; J. Ferguson, fine $70; Box Miller, fine $50; J. M. Pearson, fine $50; David Guard, fine $25; R. W. White, fine $25; John F. Hoskins, fine $50. Stephen A. Aplin went in of his own accord and acknowledged the killing of a buffalo and was fined $50. This is the only buffalo killed in the Park, so far as known, since the 1st of July last. The rifles of the seven convicted men were sent to the Department of the Interior. Superintendent Wear expects to remain in the Park all winter, and do what he can to prevent the destruction of game by the skin-hunters that have heretofore slaughtered it with impunity.

It is to be hoped that Congress will increase the number of assistants, so that the game may have the protection that is so necessary to preserve it. With proper care and the right kind of assistant superintendents the hunting in the Park can be wholly stopped.

THE MAD DOG SCARE.

THE daily papers are giving much space to alleged cases of rabies and hydrophobia. The senseless mad dog scare has in several localities reached the proportions of an epidemic. Town authorities are making an indiscriminate and unreasoning warfare upon all dogs.

This deplorable condition of affairs may easily be accounted for without the hypothesis that any one of the numerous alleged mad dogs is actually afflicted with rabies. We have seen scores and scores of dogs said to be rabid, but which we were perfectly convinced were in fact not rabid, but simply suffering from some one of the various harmless forms of fits to which dogs are subject. But in each of these cases witnesses were not wanting whose ignorance and imagination converted the dog in a fit into a mad dog; and we have no doubt that some of these people, had they been bitten by the animals in question, might have died, not from hydrophobia, but from the effect of fright and imagination. Alleged cases of death from hydrophobia are in most instances simply death from fright. Of this there can be no dispute.

The publication of M. Pasteur's investigations and experiments has had the natural effect of drawing public attention to this subject, and people are more than ever ready to accept and exaggerate all mad dog stories without stopping to inquire into their truth. Fear adds to credulity. Not one individual in ten thousand possesses any accurate knowledge of the symptoms of rabies, and once the cry of mad-dog is raised it is repeated from mouth to mouth, and the community is straightway beside itself with fright.

The evil to contend with is not so much hydrophobia itself as the ignorance about the disease and the proneness of individuals to accept every false mad dog alarm. If M. Pasteur shall succeed in perfecting his discoveries, the preventive will be most valuable, not in lessening the few cases of genuine hydrophobia, but in so reassuring the community as that it shall not be imposed upon by unfounded belief in hydrophobia.

If by vaccinating dogs it shall be possible to render them secure against rabies, and if by that security the community shall be so reassured as to regard hydrophobia with indifference, as something about which there need be no apprehension, then it may be wise and highly desirable that the vaccination of dogs should be required by statute.

Pending the attainment of such developments, it would be a capital thing if the editors of newspapers would refrain from publishing the rabiacal rubbish with which they now fill their columns, creating unfounded public alarm on the subject, and getting up mad dog scares just for the sake of sensation.

THE GAME SEASON.—The ruffed grouse shooters report from very many localities this year a good supply of their favorite game birds. We heard the other day of one sportsman in Springfield, Mass., who in an afternoon stroll with a spaniel and without a gun, put up forty grouse—and not go far from the center of the city either. The quail supply of 1885 is also proving generally abundant. From all sides come reports of many and full coveys. There are isolated localities where poor shooting is always the rule, for in these districts even in seasons which are exceptionally satisfactory elsewhere, the birds have no opportunity to hold their own. Woodcock shooting in the northern covers has not been much of a success, and this for reasons stated in these columns last spring when we foretold a poor season. The birds migrated late, nested further south than usual and did not reach the northern grounds in anything like the usual numbers. Moreover, the sportsmen in the regions where the birds tarried very injudiciously pursued them instead of recognizing the unusual condition of affairs and making allowance for it.

ICE YACHTS AND SNEAKBOXES.—In answer to many inquiries concerning these two craft we are preparing full working drawings of each. Next week we will publish plans of the latest Hudson River ice yachts, and shortly after will appear several articles on sneakboxes and Barnegat cruisers, giving lines of the old sneakbox, "Seneca's" cruiser, and a new and improved boat of the sneakbox model, designed specially for the FOREST AND STREAM. All of these designs will be to scale, with full instructions for building.

IREX AND THE AMERICA'S CUP.—The report that has been circulated through some of the daily papers during the past week, to the effect that Irex has challenged for the America's Cup, is entirely without foundation, as no such challenge has been received. The club now have the challenge from Galatea, which they must consider before any other. Mr. Jameson has not as yet expressed his intention to bring Irex over next season, though it is not improbable that he may do so.

ONEIDA LAKE METHODS.—Game Constable Lindsey has recently captured a number of nets illegally used in Oneida Lake. The netters, whose occupation has been taken from them, have now turned their attention to target practice and amuse themselves by shooting at such members of the Onondaga Sportsmen's Club, of Syracuse, as venture out in the lake duck shooting. Our correspondent "Onondaga" reports his narrow escape from the poachers' bullets.

ADIRONDACK DEER.—Wherever the non-hounding law has been enforced in the Adirondacks the people are satisfied with its wisdom. An actual test of the new order of things has won over many of its former opponents. There can no longer be any reasonable question of the wisdom and beneficial result of such a statute. Now friends of game protection must see to it that the law is not changed by the clique who are inimical to all righteous game laws.

THE WOODCHUCK affords a subject for a most interesting paper, published elsewhere, from the pen of a well-known physician in Central New York.

TO THE WALLED-IN LAKES.

II.—"INSIDE BIG WATERS."

BEFORE day broke the next morning I was awakened by the rasping noise made by something scraping along the canvas of the tent. The familiar sound told its own story, and I was not surprised, when I arose and looked out of the tent door, to see the ground covered with snow. It was not cold, and the rapidly falling flakes were damp and melted as they touched the clothing. Yellowfish had already started out in search of the horses, which would be easily tracked in the snow, and before breakfast was ready he had driven them up to the wagon, where they were tied, so that we might start as soon as the snow ceased falling.

About 8 o'clock it stopped snowing, and, quickly breaking camp, we moved out, Yellowfish and I in the lead and Appekunny driving the team behind us. Just as we started we saw a horseman, followed by a loose horse, going back over the ridge down which we had come the day before. At first we supposed it to be an Indian, but a little later we came upon the horse tracks leading down into the basin of the St. Mary's Lakes, and as no Indians were known to be there, it was thought possible that some gold diggings had been found in the basin and that this might be one of the prospectors with a pack animal going into the settlements for provisions.

A drive of a couple of hours brought us to the top of the ridge, from which we could look down into the valley of the St. Mary's Lakes.

The scene was curiously beautiful. The sky had not yet cleared, and a heavy fog hung about us, so that we could see but a short distance on either side. Down below in the lake valley there was little mist, so that the lower end of the upper, and the whole of the lower lake were visible. The shores and the rounded hills, which formed the immediate surroundings of the latter were seen, the ridges covered with bright green quaking aspens with here and there a little open park where the ripened mountain grass showed yellow amid the green. Dimly through changing mist clouds we could see now and then a long way up the Upper Lake, and recognized, or thought we did, the stern black faces of tremendous escarpments which rose from the water's very edge. Now and then a soft veil of mist would drop down from the overhanging clouds and float from the upper end of the lake to the lower, now concealing and then revealing the beauties of the scene. That the valley of the lower lake was much wider than that of the upper one we could see, but could form no idea as to the height or character of the mountains by which they were surrounded. All this was hidden by the fog, so that whatever of the mountains was above 1,500 or 2,000 feet higher than the level of the water was left to the imagination. The lower lake is seven or eight miles long and lies here nestled among the steep quaking aspen ridges. From its northern end the St. Mary's River flows out to join Belly River, and so the Saskatchewan, while the tremendous volume of water supplied by the upper lake empties in from the south. The deep blue of the waters point to a great depth for the lake, and in most places there is little evidence of any shoal water along the shores. On the upper lake the vertical cut walls and the steep talus slopes, together with the occasional gleam of permanent snow far down the mountain sides, hint at a glacial origin for the lakes.

When the wagon came up there was some question as to whether it would be wise to make the descent into the basin at this point. Certainly the slope was tremendously steep, and the snow on the ground made things so slippery that it might be very difficult to control the wagon if it should once get started. On the other hand, there was no load worth speaking of in the wagon, and by rough-locking the wheels and holding back with ropes, it seemed as if we ought to be able to get down. By means of a couple of log-chains we prepared the wagon as well as possible for the somewhat perilous descent. The mere upsetting and scattering of our goods and chattels over the hillside would have been no great misfortune, but if the wagon once got away from us on this very precipitous slope, it seemed likely that it would not stop before the bottom of the hill was reached, and in this case we should not only have the wagon to mend, but very likely also a dead horse to leave behind; so with one man managing the reins and brake, and two behind trying to keep the hind end of the wagon from sliding down the hill, we started very carefully and slowly.

We had not gone very far before we wished ourselves back on the top of the hill. The slope was a hard grass-covered gravel and over this were two or three inches of snow and ice, and the rough-locks, instead of catching, slid along over the ground like the runners of a sleigh. Do the best we could, Yellowfish and I were hardly able to keep the wagon from swinging around and starting down the hill backward. Little by little, however, we worked our way down and as soon as possible edged the wagon into a grove of aspens where it was impossible for it to get away. Then by cutting a path with the axe we managed to safely reach the foot of the steep hill. From here on our road was an easy one, leading across the ridges that ran down at right angles to the shore of the lake and we gradually worked down the slopes until we came to a curving bay near the head of the lake where we made camp. It was a pleasant spot, open and level. On the one side were the hills which bounded the basin on the east and on the other the lake. The camp ground was perhaps fifty yards in width and on it the grass grew knee deep. On the right a ridge came down to the lake shore, on the left was the channel of a tiny brook with its fringe of tall cottonwoods, in front the terraced ridges rose one above the other until they melted into the steep face of the pine-clad hill. Between us and the water was a dense thicket of alders, through which ran a path, now overgrown with grass and weeds, down to the shore of the lake.

The wagon was halted near the edge of the alders, the horses hobbled and turned loose, then the tent was pitched facing the east and a fire started, and while Yellowfish was chopping wood and beginning to get dinner ready, Appekunny and I walked down to the lake shore. It is indeed a lovely sheet of water. And scarcely less beautiful when seen in part, as now, than when its whole expanse is spread out before one. It was now smooth and tranquil, and its dark waters under the sombre sky looked as if they might contain mysterious and terrible monsters, ready at any moment to rise to the surface and grasp those who should venture within their reach. The great hills and overtowering mountains were scarcely reflected in the unruffled depths, but seemed rather to cast shapeless shadows which now and then moved slowly hither and thither in an unexplained way. Across the lake the dark pine-clad hills rose until they were hidden in the clouds, and down near the water the ridges were brighter with the pale frondage of the aspens, which even now showed here and there a touch of gold that told of the approach of winter. It was all quiet and still under the dull gray sky, and there was no life upon the lake or on the shore.

A few yards down the beach, hidden among the alders, we found Appekunny's boat, undisturbed during the ten months that had elapsed since he cached it there. Under it were the oars, thole pins and gaff, and in a few moments we had launched and brought it to the end of the path leading from our camp to the water, where we left it to soak and tighten, while we went back to camp.

After dinner, taking rifle, rod and trolling lines, we set forth to paddle up the lake to the inlet. Yellowfish was loath to accompany us, for the Piegans do not like to venture upon the water. They know that terrible gods—the under water people—live down in the bottoms of these lakes, and they fear Windmaker and the others. Similarly many of the west coast Indians fear to venture on the mountain lakes, dreading the power of the monsters that inhabit them, and in this fear we see another example of a belief that is worldwide among savage people. After some persuasion he was induced to come.

Close under the beach, in the wide and shallow bay to the east of where this enters the lake, we saw a great many ducks, and here later in the season, I was assured, the geese rest in great numbers on their journey to the south. The water is shoal, and the white sandy bottom, here and there overgrown with succulent water grasses, explains the attractions which this spot presents to the migrants. At the head of the lake we drew the boat out on the sand beach and walked for some distance up the inlet. This is a broad, hurrying stream of purest cold water flowing through a level valley a mile or more in width. A large portion of this flat is overgrown with willows, but along the inlet itself, and occasionally extending for some distance out over the flat, there is a thick growth of large spruces and cottonwoods, and beneath these a tangle of willows and alders, which is almost impenetrable. It looks like a great place for white-tail deer, and as if there should be some moose here. Forcing our way through the underbrush we reached the high bank which overhangs the water, and looking down upon what seemed the perfection of a trout stream, I set up my rod. The sun was now low and it was just the hour one would choose for fishing such a stream, but although we patiently whipped its waters for perhaps a quarter of a mile we accomplished nothing. Down in the clear depths we could see the great fish lying on the bottom, but, cast as deftly as we might, they paid no heed to our flies. I changed the cast several times, hoping in this way to tempt them, but without success. And yet it did not seem that the trout were satiated, for a vagrant young whitefish which was meandering down the stream, caused great excitement among the big trout, who made most vigorous attempts to capture him—attempts which were unsuccessful I was glad to see. We caught but a little fellow weighing a quarter of a pound, and as we compared him with others eight or ten times as large, which lazily breasted the current at our feet, he seemed fairly contemptible.

The capture even of this little fish did some good, however. When Yellowfish first saw my rod set up he asked what it was for, and when told merely remarked, "No good; it will break." When the fish was fast, however, and darted down stream, causing the rod to bend, and then gradually yielded to the strain, and came back and finally up to the bank, the Indian displayed a good deal of excitement, and finally after looking closely at the rod, he tapped it with his finger and said, "*Ehya skoon-a-tops*" (strong). There were plenty of good trout in the water, but our best endeavors failed to induce any others to come out on to the beach. A few good-sized whitefish were seen lazily swimming about.

As we could make nothing out of the trout we returned to our boat, and coasting along the shore crossed the mouth of the inlet, passing the sand shoals on which the geese roost in November, where we saw the tracks of a small bear, and a little later disturbing great flocks of teal and widgeons, which noisily rose at our approach, and then, after making a wide circle around the boat, settled on the water in our wake. Here and there on the water, as we moved slowly along, we saw the leaves and gnawed twigs of the willow, showing fresh marks of the beaver's teeth, and in more than one place we noticed the tracks and the wide trails where these animals had gone in or out of the water.

Almost the whole length of the lake is in view from its head. Towards its lower end the valley grows wider on either side, and the hills, especially to the eastward, become lower, so that when the river leaves it, the tops of the bluffs are only a few hundred feet above the water and were now visible below the clouds. Half way down the lake and close beneath the eastern shore is a beautiful island half a mile in length, for the most part overgrown with spruces and aspens, and with a little circular park in the middle, smooth as a lawn. Between the island and the shore is a deep channel.

It was a noteworthy fact that down by the lake shore there was no snow at all, while a few hundred feet above the grass on the hillside was almost covered, and the higher hills and mountains were still white.

PODUNK POND.

PODUNK may not be considered euphonious, either as a whole or in sections, but it is distinctively a name that when pronounced is apt to give rise to a number of queries. In fact, I think I never knew the name to be hauled in by the heels before an audience of strangers and received in utter silence; wild laughter awaited it, if not a rigid cross-examination as to its parentage and baptism. It is, so to speak, a neighbor, and my own curiosity as to its origin was aroused so long ago that my hair has grown gray since I began my excavations into its pedigree, and my labor has resulted only in finding that its origin was mislaid long years ago. My friend, Dr. A. W. Holden, the historian of the town of Queensbury, who has genealogies dating from the Paleozoic age at his finger's ends, tells me it is, probably, an Indian name, but cannot tell which particular Indian bore this patronymic. I think the name should be spelled Podonk, for I have heard it pronounced as though the speaker were trying to imitate an old gander leading a flight of wild geese. The map makers have committed a burglary and filched from Podunk Pond its birthright, therefore on the map it will be found as "Ore Bed Pond;" but when Podunk becomes a fact in the mind of the hearer instead of a jarring sound, the most natural question that arises is, where is it? or, if it is mentioned that Podunk Pond contains fish, this will be varied by—how do you get there?

The pond is in the town of Fort Ann, in Washington county, N. Y., and to get there from this place one can take his choice of going to Johnnycake Corners, then to the "striped house," then to the "pea-green hotel," and then through Beartown; or, go to Tripoli and thence to the "pea-green hotel," and instead of turning to the east, through Beartown, continue north through Frog Hollow and Hogtown. Vivid imagination? Not a bit of it! Imagination is my weak point, and I deal only in plain-featured facts. In the above directions I simply quote from the local gazetteer or cross roads directory. Having located the pond and given plain directions for getting to it, it may be in order to state what is to be found therein by an angler who embarks upon a sort of Pilgrim's Progress to reach it.

It was once the home of the speckled trout (the activity, enterprise and progress of the nineteenth century make it necessary, in speaking of the home of the speckled trout, to use the past tense so frequently that it gets rather stereotyped) and this day a few forlorn, frightened survivors haunt it, looking upon the foreigners that have usurped their home and rights as interlopers that occupy their ancestral halls by might, not right; but the majority of the inhabitants of the pond are immigrants—black bass.

To the writer it seems the sheerest, most senseless folly to stock a trout pond—or a pond that can be made into a trout pond—with black bass. A small pond is not a fit place for black bass if it is to be constantly and mercilessly fished, as most small ponds are. A pond may be stocked with black bass and guarded for a few years until the fish have taken root, and then in a few years more all the larger bass are caught, and thereafter the pond yields only small bass that an angler should be ashamed to put into his creel. This sort of stocking is going on all over the country to-day, and in some instances by men who, from their positions, should know better: but this subject deserves a letter by itself.

Besides black bass, the pond contains yellow perch, some of which are said to grow to three pounds and more each; but the pike (*E. lucius*), the affliction of so many ponds in this State, is absent. In writing of the size of yellow perch in this pond, I am careful not to assume any personal responsibility. Very large perch are a sensitive, shrinking fish, if one attempts to become familiar with them. From my youth up I have been seeking to find a five or even a four-pound yellow perch quietly resting in the scoop of a Fairbanks scales. I know they exist or have existed off the scales, because I have frequently heard of them; but I have traveled miles and fished days, if not weeks, to meet such a fish, and thus far in life's journey I have no greater personal acquaintance with one of them than with the "philosopher's stone." Last summer I thought surely I was to be rewarded, for a friend told me of a four-pound perch caught from Podunk Pond, and gave all the particulars of the capture down to the direction of the wind and the identical spot where the fish was weighed. Half way to the pond I discovered that the perch had shrunk two whole pounds, and as they all act in the same manner upon a near approach, I have put these big perch down as very retiring.

It was early in October that my friend Mr. Cleveland, the treasurer of the Texas Club, proposed to the writer, the secretary, that we make a journey to Podunk Pond on official business. October in this latitude is one of the most delightful months of the twelve, and last October was especially charming. We had really had all the fishing during the summer that a reasonable angler could ask for, and perhaps a surfeit of fish, consequently our trip was to be one of discovery rather than for meat.

The day of our start could not have been more perfect if made to order for the occasion, and we decided to go by the

way of Tripoli and return past the "striped house," for the drive was to be no small part of the pleasure, and we wished to make it as varied as possible.

There is no finer scenery about here than is to be found on the drive to Podunk Pond; for four or five miles the road is on a ridge that overlooks the richest farming lands in the county, at this time covered with the fruits of an abundant harvest; on the left are the mountains of Luzerne, in front French Mountain and the mountains bordering the shores of Lake George, and at our right the Green Mountains of Vermont. The near-by hills are in a blaze of glory that the October haze cannot dim, and the more distant mountains are decked as for a bridal with the thrifty valleys. The endless shades of scarlet and crimson, and gold and amber, and the rich browns of the autumn foliage of the deciduous trees are indiscriminately mixed with the evergreen foliage of the hemlock, spruce, cedar and balsam; while the trunks of the white birches stand here and there in the sunlight like pillars of silver, making all together such a mass of gorgeous color that it seems futile for a simple fisherman to attempt to describe it.

My friend silently drinks in the beauty of the scene that is spread out before us until he is filled with the glory of it, then rising in the carriage, for he is gallantry personified, here removes his hat, and making a courtly bow to the north, south, east and west, says: "Madame Nature, in your proudest apparel, I salute you." Feeling that I am also compelled to pay homage to the dame's attire, I rise, bow and remark: "Madame, permit me, although personal comparisons are particularly odious to the fair sex, I must say that the Queen of Sheba with her entire wardrobe would be as an ill-fitting patch upon your loveliness. You, my dear madame, are 'high,' the queen is 'low,' Cleveland is jack and I am 'game'." I was pulled back with violence into my seat or I would have said more.

We climb sandhills, loiter to gather chestnuts, and rattle over stony roads until we come to a brook and pause for a few moments while I tell my friend of the trout I have taken from it. From the brook we go up, up, up to the backbone of a ridge that gives a fine view of the country we have left behind and we go on through a remnant of the "forest primeval" that is perched on this lofty neck of land; this, too, we leave behind, when suddenly we get a glimpse of the beyond. This is the fertile county of Washington that stretches away to the blue hills of Vermont. We are high up on a narrow ridge and on one side looking back we see the flat, rich lands of one county and on the other the rugged hills and rocky valleys of another. It is a grand sight, and Mr. C. is so imbued with it that he even forgets to sound the praises of his beloved Lone Star State. Still we drive on, and just as we think the road is about to terminate in a squirrel track up a tree, we come to a mill in the woods and there find the gentleman who is to be our host, Mr. W. P. Ostrander. It is a mile further to the pond, and when we have been warmly welcomed Mr. O. tells us that we can go on and fish as long as we choose, and are then to drive still another mile beyond to his house, where we are to sup and pass the night. While we are speculating as to whether the road will hold out for two miles more in this semi-wilderness, we discover that we forgot to get from Mr. Ostrander a written order for the boat and a young man in his employ to row it; so we halt, and, as I am the most unintelligible writer, I formulate an order, and do it with confidence, because we had been told that the young man could not read. We shortly reach the pond, and the young man was so taken with our appearance that he straightway went for the boat and we were not obliged to utter the forged order.

As I was bending over my tackle box on the grass I was conscious of a strange presence, and looking upward out of the corner of my off eye I beheld a dog. If the tackle box had been large enough I would have rolled inside of it and shut the cover and locked it, for that dog had an evil eye and looked hungry. I thought it the largest dog I ever saw, and besides he was disgustingly familiar. In my younger days I have seen some large dogs by the light of the deceptive moon, and moonlight under certain circumstances adds several cubits to the stature of a dog. I speak of a dog's front elevation, for a rear view is not so alarming. I distinctly remember one such case. With some boy friends I was plugging some melons one beautiful moonlight night in a garden belonging to my father in the outskirts of the town; we went into the garden the back way, over the fence, so that we would not disturb the gardner, who lived on the place. Louis, the gardner, had a little dog that in the day time was about seven by nine, and it was well known that he was a light sleeper, and I told the boys that I would attend to the dog, for he knew me well and was in deadly fear of me. We had not plugged more than twenty-five melons, trying to find one ripe one, before the dog appeared. As he seemed a little hoarse I looked up from my occupation and instantly decided that Louis had been trading dogs, for the beggar that was coming was over thirty-two inches at the shoulders, and I was the first boy over the fence. The next morning I found it was the familiar little dog that had hastened my departure, and later when I spoke to my father about the mysterious transformation he said it was my conscience that made the dog look so large, but I contended that it was the uncertain moonlight.

Well, this dog that looked over my shoulder into my tackle box did not require moonlight to increase his size, for in broad day he was too big. At a bench show he would be entered in the class for "speed and action—fourteen hands or over." As I was looking for a tree that could be climbed easily, the owner of the dog appeared in the person of a boy about sixteen and about half as big as the dog, who tried to assure me that the vicious look in the dog's eye was really a benevolent expression; so we chartered the boy and dog to search for crayfish—at a distance.

It was but a short walk from where we left the carriage to the pond, and a tidy bit of water we found it. The wooded hills encircle it, forming an amphitheatre from which the beasts and the birds can look down upon the area of water and witness the struggle to the death between the patient fisherman and the toothsome fish. Just beyond and connected with Podunk Pond by a small stream is another beautiful sheet of water called Lake Pond. This also contains black bass and perch, and as it can be reached only by a footpath and boasts not of boat or other water vehicle, we were told that its fish lived to a greater age than in Podunk.

Having admired the pond and its surroundings, we turned our attention to its inhabitants, and found, first, that our oarsman did not know anything about the fishing grounds and, second, that a diligent search among the contents of my tackle box revealed not a single sign of a sounding line. My dear friend and most charming companion is the president of a cotton exchange in a Southern city, and I imagine that while at home and clothed in the dignity of his office he has occasionally to make a "middling" speech concerning "spots" or "future delivery" cotton; and to keep his vocal organs in condition during his summer vacation, he is in the habit of working off remnants of old orations or preparing new ones that later will be impromptu. This was his opportunity; for one hour he discoursed about sounding lines and plumb leads, and I had either to swim ashore or listen, until it occurred to me to ask him where *his* sounding line was; then followed a silence that you could almost feel. Leaving the plumb line at home proved for me a fortunate misfortune, a paradox that is explained when I say that a month later I secured a sole leather tackle trunk from a New York trunk maker (by direction of Mr. Cleveland); the name plate bore a date that is identical with the anniversary of my wedding day and the day I forgot the sounding line, and inside the trunk the largest compartment gave notice in huge letters that it was the receptacle "for a plumb line and lead, 'and don't you forget it.'"

To forget a sounding line and lead when trying new waters, particularly late in the season, is a stupidity that brings its own punishment. The only substitute in this case was the anchor rope and anchor, and to find a certain bottom with an anchor is an operation that condenses more solid exercise than all the lifting and rowing machines invented; but I found the place we were looking for before my hands were entirely shorn of cuticle. Practice teaches one so well that it is not a difficult matter to locate certain kinds of bottom in comparative shoal water where the shore formation is also a guide, but fishing for rocks with a fifty-pound anchor stone in forty feet of water is another and quite a different kind of prospecting. When the anchor was finally down we waited long for our reward in the form of a bite, and when it came it was from a perch, and not a monster either. We fished faithfully until nearly dark and then counted the spoils and found a total of six perch. This did not depopulate the pond, but we were satisfied, and would have been without a single fish. Engaging the young man and the boy, minus his dog, for the next day, we started in the waning twilight for the house of our host, and it was quite dark when we drove to the door after climbing up a hill for a mile. There was an Adirondack flavor about the place, but we met with what Mr. Cleveland afterward referred to as "thorough Southern hospitality." Mr. Ostrander is the owner of an extensive ore bed of magnetic iron ore, but the mine was not in operation at the time of our visit.

During the evening we propounded a number of geographical questions to our host, and learned that we were but an hour's walk through the woods from the shore of Lake George; that one mile away was another pond named Sly, that contained black bass, and four miles distant was a pond that our host considered the peer of any sheet of water in the State. It is named Crossett, but more frequently called Cross Pond, and the scenery about it is described as something that must be seen to be fully appreciated. As the evening wore on my partner and I announced that we were both members in good standing of the Owl Club, and we hoped that no one would remain up past the usual hour for retiring. The Texas Club may forget a sounding line and lead, or an individual member may forget his reel, but there is no record that the cribbage board was ever left behind, and it was a late (or, perhaps, more properly speaking, early) hour that night when the last game was pegged and the poor cards of the loser duly abused.

We did not know the location of affairs outside the house, and before retiring sallied out to take an observation. I carried a kerosene lamp in my hand which I held high above my head as I peered into the darkness from the porch. We were talking in whispers that we might not disturb the inmates of the house, when suddenly as I advanced I exploded something. What a din! I had walked into and struck with the metal bars of the lamp an immense triangle suspended from the porch roof, and used to call the men from the mines. The sound struck a hill in front of the house and caromed to the left, and went around behind the barn, where it must have hit something that sent it off to the right. The air was full of it, and Cleveland whispered hoarsely, "Can't you snub it?" I put out my hand, forgetting the lamp, and off it went again. The triangle seemed to be a repeater loaded for all distances, and the second sound chased the first around the house, while I sat down and laughed, and Cleveland talked so fast that I thought he was counting the reverberations, but I managed to separate from the torrent of words these fragments: "Stop her * * just like you * * on purpose * * see how much of a hallabaloo * * could kick up * * time of night * * success * * will think * * cowboys raising * * better go to bed." And we went.

The sun was up and at work the next morning before we had finished the breakfast that was especially prepared for us by Mrs. Van Wormer, the housekeeper. Mrs. Van Wormer told us that our host had driven away on business before sleep had left our eyelids and left word that we were to feel perfectly at home during his absence.

It was another perfect morning as we drove down the mountain to the pond and caused us to feel that the bass would bite with pleasure, simply to be hauled out to behold a perfect autumn day. I had extemporized a sounding lead, and after considerable feeling, found some broken rocks nearly surrounded by grass in thirty-five feet of water. For bait we had dobsons, crayfish, minnows and crickets, and these, one after another, we lowered among the rocks and pulled up, one after another, six black bass of small size. We moved to the grass and tried for perch, but not another fish did we get that day. Six fish—and those all of one kind—appeared to constitute the limit of a day's fishing in Podunk.

We sent the young man up to the house for our noon lunch and continued our fishing. When the lunch boat returned both boats made for a point that was evidently put there for picnic purposes, and opened the two large hampers that Mrs. Van W. had sent us in response to a request for "some bread and slices of the cold ham you gave us for supper." Those hampers yielded a hot roast chicken, with gravy, mashed potatoes, Hubbard squash, tea—all hot, cream, sugar, bread, butter, pickles, apple pie, cake, cheese, carving knife and fork, teacups and saucers, knives, forks, spoons, tablecloth and napkins. My friend is a particular man, and as he looked over the spread remarked, "The only thing lacking is the ham we asked for." We toasted our host and we toasted his housekeeper and gave thanks for the "cold bite" spread out before us, and a little later, when we had filled two large pipes with Vanity Fair tobacco and were contentedly puffing at them as we reclined on a bed of autumn leaves, the two boys had only empty dishes to put back into the hampers.

As I look from my window this chill December day and see the leafless branches of the trees, through which flakes of snow are fast falling, my thoughts go back to the shores of Podunk Pond, and I prefer that this letter should leave me there with my friend, smoking our after-dinner pipes, from which the smoke slowly rises, indicating that all is peace.

A. N. CHENEY.

GLENS FALLS, N. Y.

CLIMATE OF THE WEST.

Editor Forest and Stream:

I observe that my statements of fact, and arguments supporting the conclusion that the climate of the West is being favorably modified by human agency, is vigorously combated by Mr. W. N. Byers, of Denver, Col., who not merely differs from me in his conclusions, as he has a perfect right to, but assails me with scant courtesy for propagating views which, although accepted by the "farmers and cow-punchers" of the region as matters of personal experience, are nevertheless in your correspondent's opinion so demonstrably erroneous that they should not be propagated by "able newspaper correspondents," to whom facts and figures are accessible.

Mr. Byers challenges me "with no uncertain sound" to support my conclusions, "to show one instance from human history," in which the climate has changed from arid to humid, from dry to wet, "and prove it by figures."

This attitude is more ingenious than ingenuous. Mr. Byers, it may safely be assumed, knows as well as I that the ancients recorded no meteorological observations sufficiently systematized to be of any value, or that if they did no such records have been handed down to us. He knows as well as I that even in this country meteorological observations are only of recent date; that except in a few isolated cases they have followed settlement, and consequently afford no data for a comparison of ante-settlement with post-settlement climatic conditions. If settlement in the West, as I confidently believe, is modifying climate from arid to less arid conditions, the figures necessary to substantiate this assertion, in so far as it depends on increased rainfall, should embrace not only the returns of rainfall for the period since settlement, but a wide range of observations extending backward at least three or four decades before settlement. From such an array of figures it would be possible to deduce sound conclusions—the considerable fluctuation of annual rainfall would probably admit of the returns being tabulated in periods of seven or ten years, indicating tolerably uniform returns for the several divisional periods, and the question of increase or decrease of rainfall would be tested by a comparison of two or three recent septennial or decennial averages, with the averages of the earlier periods. If there are any such figures lying around in these "diggins" I appeal confidently to them, but I certainly do not know where to look for them.

But I must do my critic the justice to admit that if he has with seeming disingeneousness tried to corner me by an appeal to figures, he has not shrunk from affording me an opportunity of assailing him with the same tactics. "Arid regions (says Mr. Byers) are all growing dryer—none of them grow wetter." Let us confine the argument to the region under discussion. Mr. Byers contends that it is growing dryer. I challenge him to produce figures in support of his bold contention. The position certainly derives no support from the array of figures cited by Mr. Byers. As above argued, a few figures extending over ten or twelve years afford no conclusive evidence, but as Mr. Byers has produced them, and presumably as evidences in support of his position, the only course open to me and your readers is to analyze them for what they are worth. Some of them extend over four or five years only, a period too short to render them of any value, but the returns extending eight years and over afford, if not conclusive, at least interesting subsidiary evidence.

To the point. Mr. Byers's table gives four stations for which the observations are recorded over twelve years. The aggregate rainfall of these for the first six years is 702.83; of the last six years 728.15. There are two stations in which observations extend over ten years, and one of eleven years; eliminating the first year of the latter I find the aggregate rainfall of the first five years is 432.30; of the second period 464.38. There are three stations for which observations extend over nine years; by eliminating the first odd year I find the aggregate of the first four years' rainfall is 244.11; of the second period 254 78. Lastly the table contains one station (Fort Benton) in which, although the returns are for seven years only, there is an interval of five years in the middle period. Here, too, the figures show 34.72 for the first three years and 40.00 for the second corresponding period. Aggregating the total earlier half periods we have 1379.24 and for the latter half 1446.71.

Mr. Byers appeals to figures. I accept his own compilation as the only available data at hand. They certainly do not support his position. As far as they are of any value, their evidence is in my favor.

But Mr. Byers does not confine himself to the rainfall. To my assertion that "the annual precipitation is far greater now in regions recently occupied, than it was when the settlers first came into the country," and "the climate of the western country is constantly being modified by human agency," he replies, "I have no hesitation in saying that the assertions quoted above are not true." He rails at the local settlers for drawing similar conclusions from their own experience, offers no evidence in support of his assertion, but contents himself with offering such explanations of the causes which mislead the local residents to false conclusions, as involves the complete surrender of his position on this point. "Again," he says, "during these years he has planted trees about his house and barn, and along the roads and ditches—meadows have been established and blue grass covers the door yard. In time he observes that there is dew on the grass, etc."

Dew appears where there was none before, not as an exceptional phenomenon, but as a daily occurrence. Does Mr. Byers require to be told that where there is dew at night the air is surcharged with moisture during the day, and that the transition from a clear, dry atmosphere to one of nightly dews is ample evidence of my contention that a change of climate has followed settlement? Mr. Byers himself attributes this to human agency. He accepts the facts that the atmosphere is charged with more moisture, he admits that the same amount of water will irrigate a larger area than it would at first settlement; but he denies that this constitutes a change of climate. He accepts the fact that there is a heavier dewfall, but he denies that there is greater precipitation. It appears to me that we are in perfect accord as to the facts; that Mr. Byers's objections apply only to the terms employed by me to give expression to them.

Neither Mr. Byers nor any man of ordinary intelligence

will dispute the statement that the great lakes and the rivers of this continent are maintained by evaporation from the ocean. As little will they be disposed to dispute the statement that there is evaporation from the surface of these inland waters, resulting in a subsidiary supply of rainfall, in Michigan, Illinois and other States adjacent to the lakes; that, in fact, if water due to rainfall from its primary source in the ocean is by any means arrested in its return to the ocean, it may be evaporated and reprecipitated locally with considerable modification of climate. These are views which I first saw put forward in the columns of the FOREST AND STREAM, supported by arguments which appear to me unanswerable. The settlement of the West has not resulted in creating a larger lake area, but it has resulted in rendering the soil of a vast area more retentive of moisture; it has resulted in arresting water on its return to the ocean, and distributing it by irrigation channels over a vast surface from which it is being uninterruptedly although slowly evaporated, and locally reprecipitated as rain or dew. Mr. Byers demands figures as the one essential of proof. It is difficult to give the precise figures. The amount of water withdrawn from the streams for irrigation purposes, supplemented by the volume of rainfall arrested in its return to the river, are the data necessary to determine the additional rainfall due to human agency. This is all evaporated from the surface to return either as rain or dew, and all the evidences support the view that the greater portion of it falls within the desert area.

Mr. Byers devotes his attention to the amount of rainfall in a given year or month, and instances a particular August which was supposed to have been an unusually wet month, but in which, as a matter of fact, less rain fell than usual, and regards this as an evidence of the fallibility of popular opinions on such matters. It would not be difficult to show, I think, that while technically wrong, this popular opinion was really right. Those who have lived long in the West will remember that years ago the rain which fell usually came in deluging storms, swelling the smaller creeks and often making raging torrents of dry ravines. Such sudden and furious storms used to, and may still be, characteristic of Kansas, Nebraska, Colorado and parts of Wyoming. If we suppose two inches of rain to be the average fall for a month in the region referred to, it is evident that if it all falls in two furious storms upon the parched, baked ground, most of the water will flow off into the water courses, and a very small proportion will sink into the soil to assist the growth of the farmer's crops. On the other hand, if this two inches of rain falls in, say thirty-two, gentle showers of one-sixteenth of an inch each, it will all of it be received by the ground, and so will all benefit the crops. In this way an inch and a half of rain might, if distributed advantageously, do much more good than twice the amount if it fell all at once or in two or three severe storms.

Thus the people who believed the particular month which Mr. Byers cites to have been unusually wet were right, in one sense, although the actual amount of rainfall was less than the average for that month. One fact, worth any array of figures, is that land formerly dependent on irrigation for a crop, will now produce good crops by dry cultivation. This fact furnishes the necessary evidence of transition from arid to less arid—the figures furnished by Mr. Byers indicate a general increase of rainfall over the whole area within the last ten or twelve years; universal testimony supports the claim of increased dewfall, and there is no reasonable ground to contend that if a wider range of figures were available, they would point to contrary conclusions. The figures should always agree with the facts. If they do not, so much the worse for the figures. A SPECIAL CORRESPONDENT.

A NEW HUNTING GROUND.

ON the boundary line between Sonora and Chihuahua, in Mexico, cut east and west by the boundary line of the United States, on the parallel of 31° 32′ north latitude, the Sierra Madre (Mother Mountain) rises, the backbone of the continent, and runs through Mexico and Central America as the Cordilleras of the continent.

The rivers which flow into the sea from this mountain divide are the Bavispe and the Moctezuma, which, rising near the boundary line, flow through the Yaqui River to the Gulf of California and the Pacific Ocean. The Sonora River rises on the boundary line and runs through the Arizpe district, watering the rich valleys of Sonora, passing the city of Hermosilla, the capital of Sonora. The San Pedro River rises in the western part of the district of Arizpe and flows northward through Arizona, fertilizing some of the richest valleys, and empties into the Gila River. The Moctezuma River rises near the boundary line and flows southward through the district of Arizpe and Moctezuma, emptying into the Yaqui River. The San Bernardino River rises in the Chiracahua Mountains, in Arizona, and flows southwardly through through the district of Arizpe, in Sonora.

It would be impossible to enumerate the streams and rivers which flow from this reservoir in the mountains to fertilize the plains; but enough has been given to show that this region is abundantly supplied with water; in fact nearly all mountains are reservoirs of water. In the region mentioned the altitude of the principal towns where measures have been taken averages about 2,500 feet above the level of the sea, giving a salubrious temperature and a delightful climate.

At El Paso, Tex., the nearest point where observations have been recorded for any number of years, the mercury averages 85° at an elevation of 3,800 feet above the level of the sea. In winter the mean temperature is 48°.

The Sierra Madres may be approached from the east by the Mexican Central Railway, leaving the rail at San José or the city of Chihuahua, from either of which places frontier outfits, guides, provisions and experienced hunters can be procured. In approaching the Sierra Madres from the western side the Santa Fé & Sonora Railway can be used from Nogales, on the boundary line of Mexico, to Guaymas, on the Gulf of California.

The Sierra Madres have been less explored than any other equal space on the continent; but from Government surveys, explorations and prospecting parties some information can now be gathered. As we have seen, there is abundance of water and this indicates vegetation. The timber in the Sierra Madre is grand, the pine trees reaching a height of one hundred feet and a diameter of five feet at the base. The piñon or short-leaved pine bears a very nutritious and delicately flavored nut, much used by the Indians for food. The juniper pine grows in abundance, yielding a resinous gum and berries used in flavoring liquors. Live oaks and scrub oaks abound on the foothills of the Sierra Madre, and along the streams there are ash, cottonwoods, aspens, walnuts, beeches, willows, cedars, madroña (strawberry tree) manzanita fir, and a great variety of indigenous growths. The grasses are abundant for pasture, and animals can be fed the entire winter upon the natural flora. The scenery of the mountains is made enchanting by the purity of the atmosphere.

The game in the Sierra Madres has scarcely been disturbed by the Indians, and the region has not been visited in any force by Mexicans or foreigners. The fauna of the Sierra Madre consists, so far as known, of mountain lions, black bears, grizzly bears, and the cross between, called cinnamon bears, opossums, badgers, antelopes in immense herds, small white-tailed deer in the mountains and black-tailed deer in the valleys, wild turkeys, topknot quail, hawks, parrots, doves, cranes, herons, chapparal cocks, ducks, geese, snipe, plover, curlew. Along the streams are found beavers, turtles, catfish in abundance, bass, trout, suckers, perch, minnows, etc. The natural productions of the forests and streams are ample for subsistence—pine nuts, acorns, mesquite beans, black and white walnuts, persimmons, and the maguey in great variety.

The mysterious tree, called by the Mexicans "yerba flecha" (arrowherb), which produces the "jumping bean" is found in the Sierra Madre. This shrub attains a height of twenty-five or thirty feet and has numerous upright limbs, the flower, bark, and even the wood of the tree exude an unpleasant odor, which the natives fear as much as the Japanese fear the odor of the upas tree. The shrub bears a nut about the size of a hazelnut, which opens at maturity and drops the pod which contains a worm encased in the shell. They fall in the autumn, about the middle of October. If you remove one of these beans from a cool place into the sunshine it will begin to hop and skip about as if electrified. If you have the curiosity to see what makes the bean jump, cut a hole in the shell and you will find an active little worm an eighth of an inch long, round back, flat belly, and legs resembling a wasp's. If you leave the aperture open and expose the worm to the air, he will mend the hole with a web of strong material spun from his legs and retains his hermitage for the winter. In the spring he cuts his way out and flies away.

In these mountains is found an arborescent tree called the madrona, which attains a height of forty to fifty feet and a girth of four or five feet, on which grows instead of a leaf a net called by the natives "arana," in the shape of a sack, with capacity from a quart to three gallons, and of all conceivable shapes, woven of pure white silk attached to the limbs and twigs. This sack is filled with brown worms about an inch long which crawl in and out, feeding on the leaves of the tree. These worms mature into gadflies, and are unendurable to animals or men. The sacks or pouches are nearly as strong as buckskin, and are used by the natives for tobacco pouches.

The following note is by an intelligent observer who has passed most of the present year in the Sierra Madres, and I am persuaded that many of your readers would find the region an exceedingly interesting, salubrious and gamy winter quarters. C. D. P.

NOGALES, Arizona.

"There are also other freaks of nature in this country that are worthy of mention. The wild turkey attains such a phenomenal size that he makes a track from five to seven and a half inches in length. The oriole builds a swinging nest from twenty inches to two feet in length. Wild honey bees deposit immense quantities of honey in reservoirs which they construct in the shady nooks of rocky walls along mountain gorges, and also in hollow trees on the highest mountains. The tarantula hawk (a kind of wasp), as in other countries, swoops down and plants his sting in a velvety cockade of the huge and hairy spider, thereby completely paralyzing, but not killing him, and then lays his eggs in the still living, but helpless body of his adversary, the warmth of which hatches the egg, and the juice of which furnish the sustenance to the infant hawks until they are able to fly away on a tarantula hunt of their own. The young of the alacran (a numerous and quite dangerous stinging scorpion, from two to four inches in length) fasten upon the joints of the spinal column of the mother as soon as they see the light and there they remain undisturbed, absorbing the very marrow from her bones, until her exhaustion causes her to relax her hold upon some usually high perch (as the ceiling of a room), and her fall is notification to them that they must turn out and 'hunt for hash' elsewhere. It is from this source that they get the first poison with which to fill the sack at the end of the tail (like a serpent's fang) that rounds off their 'business end.' The centipede here attains a length of ten inches and a breadth of an inch and a quarter, and is cuirassed with a corrugated or jointed horny substance like a turtle. He has but one head, but his legs are so arranged that he can run either forward or backward with equal facility and with the speed of the fastest snake—and if you cut him in two the head part will run for its den and the other part will wheel about and follow with equal pace and certainty of 'hitting the hole.' Of all the animal kingdom the centipede is the best equipped for offensive and defensive operations. His softest footfall is hotter than the sting of a hornet, and beside him the 'fretful porcupine' would feel like the downy cheek of an infant. On his head he wears two long, fleshy 'feelers,' beneath these are two flashing, black, and protruding eyeballs (one above the other) on each side of the head, each ball about the size of a mustard seed shot; just beneath these come two powerful horns, set in flexible sockets and shaped and pointed forward and inward like those of a young bull—and with these he can bite through half a dozen pie-plates; beneath again, come two powerful stings, shaped like the horns but not so large, and just beneath or rather between these is the prettiest, most cunning, and even kissable looking little mouth you ever saw on an animal—and in this strips of beefsteak will disappear like water poured into a rat hole. He is always as hungry as a hired man, and, as the colored preacher said of the devil, 'He is always goin' about like a roarin' lion seeking whom he might catch somebody.' He kills roaches, rats, bats, children and grown people. He is especially fond of children and bedbugs, and is always prowling about under your blankets at night in search of the latter. He may not tackle the sleeper but if he gets in full chase after a bedbug over your naked leg or body, you want to be careful not to interfere with the race, or the hottest grease would make a cooling application to the spot where the centipede was checked—for each one of his countless legs terminates in a long, curved, keenly pointed, jet black sting as hard as steel, and as he buries these into the quivering flesh the curve in this sting gives him a purchase whereby he brings into play two other huge blunt stings that project at different angles from the inner side of each leg above. Thus, according to his length, which determines the number of legs, he can instantly bury into your flesh from 140 to 400 stings—and this he can repeat ten times a second, while on a keen run. Lockjaw follows in two to three hours, and death in as many more."

IN THE FORESTS OF NEW BRUNSWICK.

III.

AFTER our visit from the moose, and after the excitement which it caused our little party was passed, we pitched our tent not far from the shores of the stream, in as level a spot as we could find in this wooded, wild and rocky country, fitted by nature either for the haunts of wild beasts or for the growth of timber alone. We were now in the center of New Brunswick, at a point equi-distant from the eastern line of the State of Maine and the waters of the Gulf of St. Lawrence. Three of us the next morning descended the Dead Water in the canoe, with the baggage, seeing on our way down several beaver houses close to the bank of the stream, as well as noticing where they had been feeding a day or two before on the broad leaves of the water lily, which was abundant on the muddy shores of the dark and deep pools through which we passed.

About a mile's paddle brought us to a series of rapids, where the stream was full of granite boulders, among which it made a quick descent of about a quarter of a mile to the Little Southwest Lake of the Miramichi River. At the head of these rapids there was an old Abenaki Indian portage, of which we availed ourselves, part taking the canoe out of the water and carrying it down to the lake, while the rest shouldered the provisions, cooking utensils and bed clothes, and carried them down to an old hunting camp close to the shore of the lake, where the stream down which we had descended united its waters with it. This camp had not been occupied for a year and the birch bark covering was off the roof, so we sent the canoe down the lake, which is about four miles long, for a load of white birch bark to render our habitation comfortable. While the canoe was down the lake, the rest of the party set to work picking fir boughs with which to make our bed, while others cut and carried hardwood logs for our night's fire.

When the canoe returned with a number of sheets of bark we were all ready to make use of them, and in a few minutes had a neat little log camp, well covered with a material impervious to any rainstorm. While the camp was being prepared the Indian boy could not resist the temptation of going a hundred yards or so from the place where the brook joined the lake and where there was a famous fishing place, where one could stand on the high granite boulders which are strewed about through the water, and cast his fly or bait without fear of his hook being caught in an overhanging tree. Under these great rocks the water is very deep, and here the largest trout love to hide themselves, indeed the sea trout from the Gulf of St. Lawrence ascend the Southwest Miramichi to its very head, and as the fisherman seldom finds his way into the deep recesses of these forests, one is always sure of trout at the proper season. The boy soon returned with a string of large fish, one weighing over two and three-quarter pounds. Of course at that season of the year (October) they were not fit to eat, but the woodsmen and the Indian boy seemed to relish them, judging by the way in which they gathered around the frying pan with their tin plates so soon as the cook had done his duty. Indeed I never heard any of our lumbermen say that a trout was ever out of season.

The next morning we sent the canoe down the lake with a party led by an experienced woodsman, whose duty it was to find a surveyor's line eight miles distant from our little camp, in which the cook and myself were to await their return. This camp was about three-quarters of a mile from the head of the lake, which was here very shoal and full of grass and reeds, among which we could see flocks of black ducks feeding. These birds took good care to keep either well out in the center of the lake or behind some of the islands, of which we counted fifteen, one of them a quarter of a mile long. The shores of the lake were generally low and fringed with a border of sapling white pines, whose light green tops I could see from where I sat, waving beneath the chilly autumn wind.

Ice had been making around the shores, and now and then there were slight snow squalls. Although the land at the head of the lake was low near the shores, at the distance of a mile from them was a range of high hills extending northwardly to Nictaux, these which formed the watershed between the St. John River and the streams running into the Gulf of St. Lawrence rose one after the other, not differing much in height. They were separated by high valleys, and their summits were covered with hard wood, the sides by spruce accompanied by some pines, indicated by the lighter color of their tops. This range of hills is called by the lumbermen the "Cow Mountains."

A small brook running from a little pond emptied itself into the head of the Little Southwest Lake, and here was the termination of the Indian portage from Long Lake, on the head of the Tobique, a branch of the St. John River, the distance between the two lakes being some eight or nine miles; and here also we found a motley collection of catamarans and canoes very much the worse for wear. One of the log canoes, which had been a very large one, had been cut in two and fitted with a square stern. There was also here a little canoe made of spruce bark, which would only carry one person. Its gunwales were made of two poles, to which it was fastened by thongs made of the inner bark of the white cedar, which the Abenakis use for many purposes in which strings are required, indeed, they often carry their packs by bands made of it placed around their foreheads or across their shoulders. The Indian portage, which we followed for a mile or two, had been neglected for some years and trees had fallen across it, making the traveling uncomfortable. We found on one road the place where Col. Maunsel had camped some years before on a canoe trip which he and Mrs. Maunsel had made through from the St. John River to the Gulf of St. Lawrence by the way of the Tobique and Little Southwest Miramichi rivers, a journey which many men, not to say ladies, would have feared to make, as the Little Southwest Miramichi some miles below the lake is a very rapid and rough river.

We saw on our route frequent signs of moose which are yet abundant among the valleys and on the sides of these solitary mountains. These signs were moose woods, small white maples or other trees whose bark had been peeled by these animals a winter or two previously. The former presence of the moose was also evinced by the tops of shrubs or twigs bitten off by them.

One of the early Catholic missionaries to Acadia, who was there in 1677, Father Christian Le Clerc, relates how the Indians, whom he frequently accompanied, could tell on their hunting expeditions how long it was since the moose had passed by merely biting the top of the twig which the moose had bitten off. The father had seen them as I have done doing this, but drew a wrong inference. The Indian took the shrub into his mouth for the purpose of splitting it

down with his teeth and then examining the color of the bark, if this were perfectly fresh he judged that the moose had been there since Christmas, if, however, it were dry and discolored he judged that the bite had been made early in the season, and that in all probability the animal need not be looked for, as he would have been traveling for a long time, while in the former case he would in all probability be found somewhere in the vicinity EDWARD JACK.

FREDERICTON, N. B.

AN OUTING IN MICHIGAN.

THE particular outing of which I write, was not the annual encampment of the I. C. F. Club, which occurred this year, Aug. 6 to 19, on Long Lake. But rather a brief outing by some members of the club during the encampment—an outing within an outing—which came about after this fashion.

On Saturday morning after our arrival, a boat load (consisting of Mr. J. and wife, and niece, and the writer) took an early start for the old camp, a point at the head of the lake where the club had camped in '84. The weather seemed (to a landsman) propitious, our tackle was in prime condition, the lunch as choice and bountiful as the general "smoke" could furnish, and the vision of a lively day and a large catch put strength into the muscle and spirit into the heart, and greatly relieved the toil and tedium of a long pull of three miles.

We anchored in the bay not far from the old site, and began fishing with very moderate success, only an occasional bass seemed disposed to take the tempting bait we offered, and allow himself to be inveigled into the landing net and thence into the boat. We had numerous reasons to offer for the indifference of the fish, but at last agreed to blame it on the strong wind that had commenced to blow soon after our leaving camp. But we comforted ourselves by hoping it would scon fall and leave the fish voraciously hungry. Alas for a fisherman's hopes, instead of falling, the wind rose higher and higher, and with it the waves, until the ladies expressed a wish to be taken ashore. Leaving them to prepare the lunch, Mr. J. and I pushed out again to give the fish another trial. It was not long, however, before disgust, or fear, or perhaps both, constrained us to go ashore. "It is an ill wind," etc. While we were bewailing our bad luck, and discussing the supplies of the cook, another party of four (Mr. S. and daughter, Mr. G. and sisters), concluding it was a grand day for a sail, had started out in the sailboat, and were having rare sport cutting the waves before a driving wind. The sport, however, changed to another experience quite serious, for in trying to go back, they found the craft unmanageable. Our nautical friends then said they would tack her, but she did not seem to understand the term, and certainly would not obey the order. I wonder if the drunken and profane habits which the owner afterward developed, had anything to do with the boat's caprice and obstinacy. Do boats ever take after their owners? The trouble was certainly attributable to something else than the sailing abilities of the crew.

They determined at last, if she would not run dead against the wind, if she would not tack, she must be run ashore, for she was shipping water, and the situation was really becoming perilous. By the heroic and herculean efforts of the men, and the admirable courage of the ladies they finally conquered. With blanched faces, drenched clothing and wocbegone appearance, they landed near the old camp. Their cry of distress brought our party to the scene. We helped to beach the boat which was half full of water, and then did what we could for the relief of the distressed crew, generously offering the remainder of our lunch, and parting with what dry garments we could spare.

The ladies had lost their appetite in the excitement of the sail, but the men were ravenous, and the meager supply we could offer only aggravated them.

We were positive the wind would fall when the sun went down, and joked considerably about having to remain all night in the woods. Some one suggested walking to camp and insisted on making the start. We were obliged to give that up as impracticable. So we concluded to make the most of our stay, and whiled away the afternoon watching the big waves coming in, singing snatches of songs, and indulging in pleasantries. Some were sleeping wherever they could find a log with a smooth surface, and others were broiling fish and eating it. It was excellent, barring the lack of salt.

At last the sun went down, but not the wind, and the conviction forced itself upon us, that our little joke was to be a reality—we must spend the night in the woods, supperless and shelterless. We set to work to construct a brush tent to protect us from the strong wind. Our penknives were very serviccable, but scarcely sufficient for the emergency. However, in a sort of a way, we improvised a shelter, and were preparing to occupy it, when we were joined by another party of four, a gentleman and his wife and two children, from Alpena, who had come out for a day's pleasure, and, like ourselves, could not return. They were welcome arrivals to our exceedingly hungry party, as they had a remnant of their lunch, which they generously distributed.

We had not prepared for a night out, and notwithstanding the big fire we had built, we were uncomfortably cold on that side of the body next to the wind. To add to our discomfiture, about 10 oclock it began to rain, and then there arose a cry of distress that even the pitiless winds might have heeded, as we tried to relieve our depressed spirits by loud lamentations and bitter reproaches for not having brought overcoats, shawls, rubber coats, etc. After that we took a philosophical view of the case, and courted the oblivion of slumber.

Somebody roused me near midnight and hinted that the fire was low, and a little wood was in demand. Half awake I got up, caught hold of a stick of wood to throw it on the dying embers, but suddenly dropped it, as it was burning on the under side, and blistered my fingers terribly. Then I went out into the rain and darkness to gather wood for the fire. Oh, such a night to be out! Why did we not gather plenty of wood before dark? I moved cautiously in the brush, for I had the dread of the boy whose mother sent him out in winter to get some wood. He complained that the snow was too deep. She said "Rustle it up." He answered her, "Rustle up the dickens, I might rustle up a snake."

Having replenished the fire, I returned to my quarters, and gave orders, that as my work was done, I did not wish o be disturbed till morning. In spite of wind and rain, unger and cold, I went to sleep again. Who kept up the re after that, I do not know. Sabbath morning was breakg, cold and clear, when I awoke to find that the wind had allen, the rain had ceased, and the roughness of the lake ad subsided. We did not lose much time in launching our boats and pulling for the camp. Our friends were glad to see us. They supposed we would find shelter at some house, and had not lost any sleep on our account. The recital of our perils and privations awakened no little sympathy, and we were made the recipients of many kindnesses.

Some dry clothes, a warm breakfast, and soon after, a refreshing sleep, were effectual in restoring our good spirits. We were apprehensive that the exposure might prove serious to the ladies, who were ill-prepared for such an adventure, but none of the party suffered even the slightest cold or indisposition. Since the occurrence we have no reason to be sorry for it. It was a novel experience to all. But we are all entirely satisfied with it. We vote unanimously—no more such outings for us. SELIM.

SEWICKLEY, PA.

Natural History.

ARCTOMYS MONAX.

THE WOODCHUCK OR GROUNDHOG.

THE scientific name of this animal is derived from the Greek *arctos* (a bear) and *mus* (a mouse); also, from *monas* (solitary) and *ax* (tendency). Thus the entire name, literally rendered, means a mouse bear, with a tendency to solitude—to be alone; "to flock by himself." The common name in this region of country is woodchuck. "Chuck" is the Persian name for hog. From the fact that this animal burrows in the ground it is called in some regions the groundhog. From its habit of living in the woods and along the borders of wooded ravines it is called the woodchuck, or the woodhog. The negroes of Virginia call it a "moonax," for some reason they have the scientific name in part. The range of this animal north is limited only by Hudson's Bay. It is not found south of South Carolina. East and west, it ranges from the Atlantic coast to the Rocky Mountains.

It is from 15 to 18 inches long, thick-set, rather clumsy, neck very short. In color it is grizzly gray on the back and chestnut red below. Legs very short, tail bushy and rather flat.

They are very numerous in valleys where there is alluvial soil and in regions where sandhills abound. In early spring and summer they come from their winter retreats in the woods and groves, sandhills and other slightly elevated grounds, above high-water mark, into grassy meadows to feed and raise their young. They prefer clover fields as feeding places.

They raise from three to five young ones, and it is a very pretty sight to see the mother and four or five little ones sitting up together in front of their hole. Their hearing is very quick; they are keen-sighted and very vigilant. I have tried many times to get over a fence from one to two hundred yards distant from them, only to be disappointed by their retreat to a place of safety. They are very sharp observers, first-class sentinels, eating a little and then sitting up to take a general survey, and then repeating the process.

They have great curiosity. When alarmed they run for their holes, but when within easy reach will often stop to get another view before going into their burrows. In from twenty to thirty minutes they will come out, very cautiously, only just far enough to see if an enemy is near. By degrees they will wholly emerge, and at length sit up and take a wide survey before venturing far to feed.

I have heard many stories in regard to their weight, some saying that they have seen those that would weigh twenty pounds. I have shot with my little .32-caliber rifle over 500 of them in the last few years, and the largest one did not exceed thirteen pounds. About one in one hundred wood chucks are black. They seem some stronger and larger than those of the ordinary color, and, if possible, more vigilant. I have to secrete myself and wait for them to come out if I am to get a shot at them. Have killed some five or six black fellows.

The colored people know how to prepare and cook them so that they are very good eating. A spring chuck killed in September, or one only a year old, is by far the best eating. Old ones have a decidedly strong flavor. Some white men kill and salt down for winter's use large numbers of them. An old judge told me he had a case before him where a man was charged with neglect of his family. When on the witness stand he stoutly denied the charge, "saying he had in his cellar more than a half barrel of woodchuck meat, salted down." I know of one negro who salts down from forty to fifty every year.

Farmers are very glad to get rid of "these pests" as they call them. They dig holes in the meadows, trample down the grass, destroying in this way more than they eat. I have often heard farmers say they had rather have a "hog in their meadow than a woodchuck." Horses often step into their holes while drawing the mowing machines. Some men have been thrown from their machines and seriously injured, having legs and arms broken, and been in imminent danger of being cut to pieces. Horses are often thrown down from stepping into holes, and have to be dug out—especially if on steep ground. Farmers are very glad to feed a hunter and care for his horse if he will only shoot chucks on their farms.

Woodchucks are splendid fighters and make it lively for dogs that attack them. They die game. They call in their young by uttering a whistling sound, accompanied often by a kind of metallic rattle. If they do not promptly respond, they use force, bite them and compel them to retreat for safety. When it is time for the young to "look out for themselves," they force them to leave the old burrow by some pretty severe treatment. They use their teeth on them freely till they "dig out" and dig a hole for themselves.

An old friend of mine—quite a naturalist—while looking out timber lands in Michigan some forty years ago, came across a colony of these animals, some fifteen or twenty in number, of all ages. They did not exhibit the least fear; they allowed themselves to be picked up and handled like cats and kittens. They, doubtless, from the encroachments of civilization found themselves in a new environment, full of peril from enemies, chiefly men and dogs. Hence they have been compelled to exercise great caution, extreme vigilance, in order to survive. Doubtless the instinct of caution—by cultivation, forced upon them by circumstances—has become hereditary, as pointing has in dogs. Each animal has become his own sentinel. Very young ones exhibit this trait in a marked degree. So the chuck unacquainted with man and one of modern times differ in a great degree on the matter of vigilance. To "look out" has become a very marked characteristic of the species

The woodchuck can climb trees to the height of fifteen or twenty feet. They can swim rivers of some fifty yards in width, but seem greatly exhausted by the effort. I think they are not natural swimmers, but only swim from compulsion to escape danger, either from floods or hot pursuit. They run over fences with considerable speed.

They are not free from disease. I have killed one with the upper incisors, or long front teeth, turned upward and backward till they made a hole through the upper lip. The teeth resembled the boar's tusks and were more than one inch in length above the gums. On the shoulder of one I once found a large tumor, three inches in diameter. I have found them blind in one eye, and also with very seriously ulcerated feet. It is not uncommon to find them minus a leg, healed over very beautifully. The member had doubtless been lost in a steel trap.

They are far from being an easy animal to kill dead upon the spot. They are often within one bound of their holes, and they will escape unless the head or heart be struck by the bullet. When one sits fronting you you have not more than two and one-half inches of fatal space in width. If they sit sidewise, or are feeding, on the ground, they present not over two inches of fatal surface to the rifleman. They must be shot in front of the diaphragm or they will surely escape. I have seen them run many yards after a ball had passed entirely through the body. It requires very close and accurate shooting to secure this kind of game. I get many half-days of outing and amusement hunting *Arctomys monax* when there is no other game to shoot. Besides, I get many thanks from my colored friends for their carcasses, on which they feed with real pleasure. CHUCK HUNTER.

A HEAVY DEER.—Memphis, Tenn., Dec. 10.—On Dec. 1 Gen. Wade Hampton killed on his plantation in Washington county, Miss., a buck which weighed when dressed two hundred and sixty-five pounds. Gen. S. W. Ferguson, member of the Mississippi River Commission, who was in the hunt, attests to having seen it weighed. I believe this is the heaviest authenticated weight for the *Cervus virginianus* I ever heard of.—COAHOMA.

Game Bag and Gun.

THE ADIRONDACK DEER.

Editor Forest and Stream:

As yet there appears no reply to questions propounded by "Ampersand" in FOREST AND STREAM of Oct. 19, relative to the operations of the deer hounding law in the eastern Adirondacks.

While I would not assume to answer authoritatively for all parts of the wilderness, yet my facilities for obtaining information together with the deep interest I have felt for the observance of the game law in this respect, will, I trust, enable me to reply quite correctly to some of these questions.

In Hamilton county deer hounding has not been pursued as openly as formerly, yet it has been practiced to a considerable extent, and I can learn of no arrests being made for violation of the law. A letter from the secretary of a shooting club at Gloversville states that the constable in charge of Hamilton county is very lax in the performance of his duty, and as an excuse says it is impossible to get a jury in that county to convict a violater of the deer-hounding law, a very poor excuse indeed. This shooting club is heartily in favor of the strict enforcement of the law against the deer hounders.

In Lewis county the law has been generally observed, the only exceptions being in the extreme northern and southern portions. In the Beaver River country, which also includes the middle of Herkimer county, the law has been strictly observed, owing in a great measure to those interested in the preservation of deer in this section, who, placing but little reliance on State officials, procured a competent man to look after this locality, who was constantly on the ground and no one dare attempt the violation of the law. He was paid for his services by private contributions. The names and residences are given below:

	$245

Altogether the deer hounding law has been a success if we take into account the preservation of deer. It is safe to say that at least a thousand have been saved through the instrumentality of this law. No wanton slaughter has been committed, as pot-hunters dare not market venison killed in this way. The sentiment against hounding deer will doubtless be stronger the next year and the law be more generally observed the close season, as almost every one came out of the woods the 1st and 2d of December.

The still-hunting season has been very unfavorable, as but very little snow fell during November. But very few hunters killed more than one or two deer, and more killed none at all.

Keep the game law relating to deer where it is, add to it a more competent and efficient detective force, and plenty of deer, sufficient for all reasonable demands of the tourist and sportsman, are insured in the great Adirondack wilderness, so long as it remains a wilderness. Hounds will hunt out and drive the last deer into the water, no matter how thick the cover, and this means extermination. MUSSET.

NUMBER FOUR, Dec. 7.

Editor Forest and Stream:

Suit has been brought against Pennsylvanians who had the dog at Indian River in the Adirondacks. They deny using the dog for pursuing deer. The case comes up before Justice Evans in Remsen next week. State Game Protector Brinkerhoff says 500 deer were killed between Beaver River and Morehouseville this fall. W.

UTICA, N. Y., DEC. 10.

"Forest and Stream" Trajectory Test.

(*Continued from page* 388.)

Marlin .40.

This arm was tried at 200 yards, on Sept. 30, with good weather conditions prevailing. It was put on at 7:30 in the morning, with the barometer standing at 30.150, the dry thermometer at 71.2, and the wet-bulb thermometer at 65, giving a dew point of 62.4 and the humidity 70 per cent. of saturation. The wind came from the 12 o'clock quarter at four miles per hour. The arm had an octagonal barrel 28 inches long, and had a total weight of 11 pounds 1 ounce, while the barrel weight is given as 5 pounds 1 ounce. It was numbered 11,236. The rifling had a uniform twist of one turn in 20 inches 6 grooves, and the grooves were each .003 inch in depth, and .153 inch in width. The loading was with Union Metallic Company ammunition of FG powder, either of Laflin & Rand or of Dupont make. It was nominally .40-60-260. Three charges opened found the powder in fine condition, gave the weights as 64., 64.4 and 64.5., while

the three corresponding three-grooved bullets were 259.3, 259.4 and 259.2, the length of shell being $2\frac{1}{10}$ inches. The trajectory record stands:

Round.	50 Yards.	100 Yards.	150 Yards.
1	7.581 in.	10.931 in.	8.549 in.
4	8.514 in.	12.118 in.	9.294 in.
5	8.065 in.	11.541 in.	8.827 in.
6	8.067 in.	11.585 in.	8.919 in.
8	8.393 in.	11.945 in.	9.247 in.
Average	**8.120** in.	**11.625** in.	**8.967** in.

The 100-yard trial came on about 10 o'clock on the morning of Oct. 10, with the barometer standing at 30.285, the thermometric reading being 60° on the dry and 53.5° on the wet-bulb instrument. This would give a dew point of 46.8 and a humidity of 62 per cent. The wind was coming at ten miles per hour from the 10 o'clock quarter. With the same rifle and similar ammunition to that already noted the trajectory record stands:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.940 in.	2.391 in.	1.950 in.
2	1.930 in.	2.430 in.	2.126 in.
3	2.011 in.	2.447 in.	2.138 in.
4	2.004 in.	2.476 in.	2.139 in.
5	2.072 in.	2.521 in.	2.171 in.
Average	**1.991** in.	**2.453** in.	**2.104** in.

Ballard .40-70.

This arm is one of the fine close-shooting patched-bullet weapons, and, so far as compact bunching of the shots on the target, seemed to be fully equal to the high-charged muzzleloaders in the test. The arm was marked .40-63, but the cartridges used were of the Winchester make and marked .40-70-330. It had an octagonal barrel, 30 inches long and weighing 6 pounds, while the entire piece weighed 10 pounds $3\frac{1}{2}$ ounces. The shop number was 23,247. The loading, as above stated, was with Winchester ammunition, and the powder in the charges examined was in fine condition. It was of the regular Winchester brand, while the bullet had a composition of 20 parts lead to 1 of tin. The powder weights of three charges were 69.8, 70.2 and 68.6 grains, while the bullets ran 330, 330 and 330 grains exactly. The shell is $2\frac{3}{8}$ inches in length.

The 200-yard test was made on Sept. 30 about 5 o'clock in the afternoon, with a barometric pressure of 30.003 inches, a dry thermometer at 72° and the wet-bulb ditto at 65°, giving dew point 60 and humidity 66 per cent. The wind, at 12 miles per hour, was coming from the 1 o'clock quarter. The record at this range showed:

Round.	50 Yards.	100 Yards.	150 Yards.
1	8.128 in.	11.318 in.	8.506 in.
2	7.870 in.	11.050 in.	8.348 in.
3	7.938 in.	11.078 in.	8.381 in.
4	7.578 in.	10.697 in.	8.038 in.
5	8.048 in.	11.205 in.	8.449 in.
Average	**7.912** in.	**11.069** in.	**8.344** in.

The 100-yard trial came in the morning hours of Oct. 10, with the barometer at 30.315 inches, the dry thermometer at 58.5°, the wet-bulb thermometer at 55°, giving the dew point at 51.5 and the humidity 78 per cent. Wind velocity 8 miles per hour, from the 4 o'clock quarter. With ammunition as before the arm gave the following record:

Round.	50 Yards.	100 Yards.	150 Yards.
1	2.077 in.	2.513 in.	2.160 in.
2	2.082 in.	2.539 in.	2.142 in.
3	1.934 in.	2.388 in.	2.067 in.
4	2.023 in.	2.455 in.	2.111 in.
5	1.882 in.	2.365 in.	2.103 in.
Average	**1.999** in.	**2.452** in.	**2.116** in.

Ballard .40-85.

This is another of the patched bullet weapons, and with one of the heaviest fixed charges for its bore. It has a 32-inch octagonal barrel, and was numbered 21,257. The gun weight was 10 pounds 15 ounces, and the barrel-weight is reported at 6 pounds 11 ounces. There are six grooves having a uniform twist of one turn in 20 inches. The grooves having a width of .003 inch, and the depth .153 inch. The ammunition was of U. M. C. make, marked as .40-85-370, having a $2\frac{1}{16}$-inch shell, with FG powder, and bullet a composition of 20 lead to 1 of tin. The powder turned out of the opened cartridges in fine condition, and weighed in the three tested 90, 89 1 and 89.6 grains, while the bullet weights corresponding were 369.3, 369.3 and 369.3. No cartridge cut seems necessary in this case, except for extra length, the cartridge being similar to the .40-70 above. The trajectory record speaks for itself; it stands:

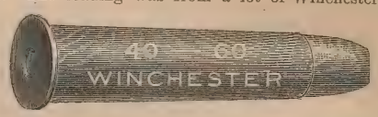
Round.	50 Yards.	100 Yards.	150 Yards.
1	6.819 in.	9.679 in.	7.272 in.
2	7.049 in.	9.890 in.	7.439 in.
3	7.211 in.	10.148 in.	7.780 in.
4	7.087 in.	9.881 in.	7.380 in.
5	7.020 in.	9.867 in.	7.381 in.
Average	**7.037** in.	**9.893** in.	**7.450** in.

At 100 yards the trial of this arm was made on Oct. 10 at noon, with the wind coming eleven miles an hour from the 4 o'clock quarter. The other weather conditions were: Barometer, 30.240; thermometer, dry, 62°, and wet-bulb 57°, making the dew point by simple calculation 50, and the humidity 50 percent. of atmospheric saturation. The ammunition, of course, was the same as before, and the record stands:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.693 in.	2.107 in.	1.795 in.
2	1.659 in.	2.012 in.	1.827 in.
3	1.731 in.	2.020 in.	1.765 in.
4	1.661 in.	2.109 in.	1.841 in.
5	1.806 in.	2.058 in.	1.879 in.
Average	**1.708** in.	**2.061** in.	**1.821** in.

Remington-Hepburn .40.

Another of the patched-bullet arms, made for fine target groupings, and like each of its class having a strong following among riflemen. The convenient side snap action introduced by the Hepburn made it a ready weapon to place in the rest, and the steadiness of the work goes to show that a fixed rest is not so prejudicial to the merits of an arm as some believe. It was of course tried without any cleaning between the shots. The weapon had a 30-inch barrel numbered 4,321. Its weight was 11 pounds and 2 ounces, and of the barrel 7 pounds $1\frac{1}{2}$ ounces. It used a $2\frac{1}{4}$ inch shell of the Remington make. The powder, of the FG Hazard brand, when three cartridges were opened came out in good condition, and the powder charges weighed 65.1, 65 and 65.5 grains, while the bullets weighed 322.7, 322 5 and 326.2 grains, and in composition were 20 of lead to 1 of tin. The rifle had five grooves with uniform twist of one turn in 20 inches, the grooves being .0035 inch deep and .160 inch in width. The test at 200 yards was made on Sept. 29 at 11 o'clock in the forenoon, the wind coming at six miles per hour from the 5 o'clock quarter. Dry thermometer stood at 73.5°, wet-bulb thermometer at 67°, making a dew point of 62.8 inches and the humidity record 69 per cent. of saturation. The trajectory heights stood:



Round.	50 Yards.	100 Yards.	150 Yards.
1	8.527 in.	11.930 in.	9.047 in.
2	8.438 in.	11.799 in.	8.994 in.
3	8.702 in.	12.360 in.	8.237 in.
4	8.877 in.	12.510 in.	9.428 in.
5	8.602 in.	11.985 in.	9.088 in.
Average	**8.629** in.	**12.117** in.	**9.159** in.

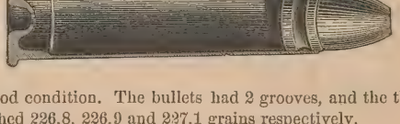
For the 100-yard test the rifle was placed in the rest Oct. 10 with the wind blowing 4 miles per hour from the 3 o'clock quater. The barometer pressure was 32.220 inches, the dry thermometer showed 65° and the wet-bulb thermometer 58°, with a dew point of 52 and the humidity 63 per cent. of saturation. Noting that ammunition and arm were as before, the record stood:

Round.	25 Yards.	50 Yards.	75 Yards.
2	2.010 in.	2.491 in.	2.182 in.
3	2.224 in.	2.713 in.	2.295 in.
4	2.059 in.	2.543 in.	2.165 in.
5	2.060 in.	2.516 in.	2.096 in.
6	2.212 in.	2.841 in.	2.563 in.
Average	**2.113** in.	**2.620** in.	**2.260** in.

Winchester .40.

This favorite magazine weapon was put in the rest for a trial at 200 yards on Sept. 30 at 4 o'clock in the afternoon, when the weather condition showed the barometer at 30.008 inches. The dry thermometer record was 74° and the wet-bulb thermometer 65.5°. This gives us a dew point of 65.5 and the humidity 62 per cent. of saturation. The wind, from the 6 o'clock quarter, was blowing 13 miles per hour. The rifle used, we are sorry to say, was stolen from its place in the rack after the tests had been made, and before the data touching the rifle had been taken. A similar rifle from stock was found to weigh 10 pounds, with 3 pounds 14 ounces in the barrel. Length of octagonal barrel 28 inches. The rifling had a uniform twist of 1 turn in 40 inches. The six grooves were each .003 inch in depth and .125 inches in width. The loading was from a lot of Winchester-made

ammunition, and three cartridges opened showed that two of the powder charges were in fine condition, while in the third the powder was pressed very hard. The bullet had two grooves and a composition of 16 lead to 1 of tin. The powder charges weighed 57.8, 58.8 and 60 grains, while each of the bullets weighed exactly 210 grains. The trajectory heights at 200 yards were:



Round.	50 Yards.	100 Yards.	150 Yards.
1	8.175 in.	11.600 in.	9.217 in.
2	7.927 in.	11.447 in.	9.024 in.
3	7.904 in.	11.321 in.	8.688 in.
4	8.149 in.	11.640 in.	9.065 in.
5	8.164 in.	11.550 in.	9.136 in.
Average	**8.063** in.	**11.511** in.	**9.026** in.

The 100-yard trial of the weapon came on Oct. 5, shortly after the noon hour. The wind was then 18 miles per hour from the 2 o'clock quarter, while the barometer stood 30.170 inches, the dry thermometer at 59°, the wet-bulb thermometer at 52°, giving a dew point of 45 and a humidity of 60 per cent. The charging was as before, and the trajectory figures stand:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.909 in.	2.181 in.	1.993 in.
2	1.823 in.	2.185 in.	1.883 in.
3	1.881 in.	2.286 in.	1.943 in.
4	1.932 in.	2.389 in.	2.033 in.
5	1.973 in.	2.413 in.	2.016 in.
Average	**1.903** in.	**2.290** in.	**1.973** in.

Bullard .40.

This rifle was one of the very complete line of rifles sent down by the Bullard Company, and came on the rest for 200 yards testing at half past three on the afternoon of Sept. 28, the wind at the time coming from the 6 o'clock quarter at the rate of 4 miles per hour. The barometric pressure was 30.200 inches, the dry thermometer 73 2°, the wet-bulb thermometer at 61.6° with a dew point of 52.2, and indicating 48 per cent. humidity in the atmosphere. The rifle had a 20-inch half octagon barrel, and was marked No. 141. Its total weight was 10 pounds 1 ounce, with a barrel weight of 3 pounds 11 ounces. The rifling was uniform, 1 twist in 20 inches, having 5 grooves, each .005 inch deep and .170 inch wide. The loading was with U. M. C. ammunition .40-70 230. The powder being of the FG brand and the bullet composition 20 lead to 1 of tin. The three charges examined showed powder weights of 70, 70.4 and 69.8 grains, the powder in each case being pressed hard, but otherwise

in good condition. The bullets had 2 grooves, and the three weighed 226.8, 226.9 and 227.1 grains respectively.

The trajectory calculations showed:

Round.	50 Yards.	100 Yards.	150 Yards.
1	7.232 in.	10.296 in.	7.892 in.
2	7.340 in.	10.312 in.	8.672 in.
3	7.361 in.	10.514 in.	8.318 in.
4	7.113 in.	10.240 in.	8.155 in.
5	7.658 in.	11.152 in.	8.826 in.
Average	**7.341** in.	**10.503** in.	**8.253** in.

The 100-yard testing came on about the same hour on the afternoon of Oct. 5, with the barometer standing at 30.160 inches, the dry thermometer at 60.5°, the wet-bulb thermometer at 52.6°. This would give a dew point of 45.2 and indicate the humidity as 58 per cent. of entire saturation. Under those conditions the trajectory table stands:

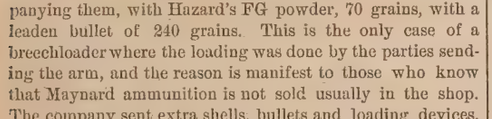
Round.	25 Yards.	50 Yards.	75 Yards.
1	1.712 in.	2.098 in.	1.792 in.
2	1.704 in.	2.139 in.	1.901 in.
3	1.754 in.	2.182 in.	1.852 in.
4	1.756 in.	2.181 in.	1.887 in.
5	1.786 in.	2.188 in.	2.010 in.
Average	**1.740** in.	**2.157** in.	**1.888** in.

Whitney-Kennedy .40.

This make of magazine arm was represented by but two rifles. The .50-caliber express has already been noted. The present arm was put upon the fixed rest Oct. 1, about 2 o'clock in the afternoon, with the wind coming at 10 miles per hour, from the 6 o'clock quarter. The barometric pressure was 30.120 inches, the dry thermometer stood at 78° and the wet-bulb thermometer at 65°, indicating a dew point of 55 and a humidity of 46 per cent. in the atmosphere. The arm itself was marked M. 218, with a 28-inch octagonal barrel. The entire arm weighed 10 pounds 6 ounces, the barrel alone 3 pounds 15 ounces. The rifling had a uniform

twist of one turn in 22 inches, and the six grooves were each .006 inches deep and .140 wide. The loading was with ammunition coming from the U. M. C. Co., of Bridgeport, Conn., and on opening the powder was found in fine condition. The bullets with two grooves had a composition of

pure lead. The cartridges were nominally .40-60-210. When opened three charges of powder weighed respectively 60.1, 60.7 and 60.5, while the bullets were 211.1, 211.1 and 209.8. The trajectory table shows:



Round.	50 Yards.	100 Yards.	150 Yards.
1.....	7.911 in.	11.355 in.	8.866 in.
2.....	8.217 in.	11.892 in.	9.490 in.
3.....	8.824 in.	12.727 in.	9.989 in.
4.....	8.228 in.	11.583 in.	8.958 in.
5.....	8.822 in.	12.653 in.	9.647 in.
Averaae.....	**8.399** in.	**12.044** in.	**9.390** in.

The trial at 100 yards took place at 4 o'clock on the afternoon of Oct. 5. The weather conditions at this time were: Barometer, 30.140 inches; dry thermometer, 58.5°; wet-bulb thermometer, 50°; dew point, 45.1, and humidity, 50 per cent. of saturation. The wind at the time was from the 6 o'clock quarter, six miles an hour. The trajectory figures were as follows:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	2.054 in.	2.441 in.	2.158 in.
2.....	1.928 in.	2.355 in.	2.086 in.
3.....	1.988 in.	2.442 in.	2.043 in.
4.....	1.920 in.	2.476 in.	2.111 in.
5.....	1.931 in.	2.405 in.	2.140 in.
Average.....	**1.964** in.	**2.423** in.	**2.107** in.

Maynard .40.

There was but one arm of the Maynard pattern in the test, and this was tried at each of the two ranges. Its manner of action by tipping made it an inconvenient one to load after each discharge, but it was very steady in its work, and the muzzle measurements frequently taken enabled the trajectory figures to be accurately determined. The rifle, when the time came to test it, was found to have the firing pin broken off. This in another arm would have made the piece entirely useless, but inquiry showed that the daughter of the range inn-keeper had a little .22-caliber Maynard, with which the fair markswoman was very clever at popping glass balls from a trap. This was borrowed, and it was but the work of a moment to change the stock from the .22-caliber barrel to the .40-caliber one, and the test went on without any trouble. The accident really enabled us to show one of the points of merit of the Maynard in the interchangeability of barrels on the same stock. The arm had a half octagon barrel, 29 inches long, with the shop mark 2,349. The entire arm weighed 8 pounds 6½ ounces, and in the barrel there were 5 pounds 4 ounces of metal. There were six grooves with a uniform twist of one turn in 28 inches. The grooves were .003 inch deep and .140 inch wide. The loading of the piece was from a lot of cartridges sent down from the armory of the Massachusett Arms Co. with the arm. They were loaded according to the letter of advice accompanying them, with Hazard's FG powder, 70 grains, with a leaden bullet of 240 grains. This is the only case of a breechloader where the loading was done by the parties sending the arm, and the reason is manifest to those who know that Maynard ammunition is not sold usually in the shop. The company sent extra shells, bullets and loading devices, but we were well enough satisfied with the lot of cartridges sent to employ them in the trial. Three cartridges when

opened showed the bullet to have one large groove, while three powder charges weighed up to 57.1, 56 and 60.5 grains, a difference so marked from the nominal weight that the charges were reweighed. The corresponding bullets weighed 243.5, 240.3 and 242.1.

The 200-yard test was made on Oct. 1, with the barometer standing at 30.170 inches, the thermometer at 55°, and the wet-bulb thermometer at 54°, giving a dew point of 53 and a humidity of 93 per cent. It was about 7 o'clock in the morning when the trial was made, and what wind there was came from the 7 o'clock quarter at two miles per hour. The 200-yard trajectory heights stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1.....	7.955 in.	11.067 in.	8.871 in.
2.....	7.992 in.	11.054 in.	8.805 in.
3.....	7.922 in.	10.999 in.	8.849 in.
4.....	8.071 in.	11.295 in.	9.033 in.
6.....	7.949 in.	11.021 in.	8.659 in.
Average.....	**7.957** in.	**11.087** in.	**8.843** in.

The 100 yard trial of the arm took place at 8 o'clock on the morning of Oct. 12, with an eighteen-miles-per-hour wind blowing from the 1 o'clock quarter. The barometer reading was 30.815 inches, the dry thermometer stood at 50° and the wet-bulb thermometer at 46.5°, making a calculated dew point of 42 and a humidity of 74 per cent. The arm and ammunition were as before, and the test showed:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	1.704 in.	2.099 in.	1.801 in.
2.....	1.579 in.	1.986 in.	1.812 in.
3.....	1.766 in.	2.221 in.	1.902 in.
4.....	1.972 in.	2.355 in.	2.035 in.
5.....	1.720 in.	2.114 in.	1.923 in.
Average.....	**1.758** in.	**2.155** in.	**1.895** in.

A TRAJECTORY CORRECTION.

A transposition in our trajectory report last week gave the record of the Merrill rifle to the Romer and vice-versa. In fact it was the Merrill which was tried at 100 yards, and the 100-yard table belongs to this fine weapon of the old type and time, when accuracy was put before convenience of handling, and the Romer rifle tried at 200 yards from the rigid rest must be credited with the table attributed to the Merrill arm. A letter from the Major clears up other points in this provoking complication. In the pamphlet form in which it is intended to make the report of the trial a permanent record, this, together with minor typographical errors, will be corrected as far as possible.

Editor Forest and Stream:

The "Merrill rifle," made by E. Phillips about ten years ago, which was tested for 100 yards only at the FOREST AND STREAM trial on the 12th of October, 1885, requires the following in substance to be published in your columns in order to correct in some respects the report upon it in your last issue of Dec. 10, 1885.

It is a muzzleloader hunting and target rifle of ordinary "type" and form, well gotten up; weight entire, 11 pounds 6½ ounces; length of barrel, 28 inches; patent breech, caliber .42 inch; the rifling is a gain twist, but the degree of it is not known (by me). It has six grooves, each .01 inch deep, and .105 inch in width; peep and globe sights, not "telescopic," and it was sighted at the trial with the former, and not with the latter; has a set trigger and metallic bullet starter which sets over the muzzle in loading, but it has no "false muzzle;" patch used at the trial was of linen oiled, and bullet a light conical or "sugar loaf," which is correctly represented in the cut and description of it in your last issue, also the powder charge. The rifle was adapted to, and hence shot from, Mr. Romer's bench rest at the trial, and not from the iron rest used on the field. The second shot followed so nearly the first one that the rifle was then changed in rest position in order to meet the requirements of the experimenter. "With such a charge from such a weapon," as the report says, "the shooting was of course very accurate, and a very flat curve is shown as follows: 25 yards, 1.130 inches; 50 yards, 1,306 inches; 75 yards, 1.273 inches."

This table, published in the Dec. 10 issue, stands assigned to Romer's muzzleloader, whereas his table (assigned to Merrill's rifle) is the next table published above mine. His table is for 200 yards, and his rifle did this shooting on Sept. 29, from the iron rest. His curve is published as follows: 25 yards, 4.499; 50 yards, 6.399; 75 yards, 4.993.

The Bland rifle was first tested in the iron rest on Sept. 29 for 200 yards, and next again on Oct. 12 in the Romer rest for 100 yards.

These explanations, I hope, may assist you, and make things more clear to your readers.

NEW YORK, Dec. 14. MAJ. H. W. MERRILL.

THE LYMAN SIGHT FOR DEER HUNTING.

Editor Forest and Stream:

For the consideration of such of your readers as may be interested in rifle shooting, and especially in hunting with a magazine gun, I wish to give my views as to the best way of using the Lyman sight for shooting at deer or other moving game.

I have no fault to find with the sight itself, for in my opinion it is just right and needs no improvement, but I disagree with Mr. Lyman as to the right way of using it to get the best results in hunting.

His directions are to remove the middle sight entirely and use only the Lyman sight and front sight, claiming that the middle sight is not needed and only obstructs the vision. Now, let me describe the middle sight which I use, and the advantage which I claim for it.

I file off the sides of a common buck-horn sight, leaving a width at the top of but little more than one-fourth of an inch, and make the notch large enough to show the front sight plainly, thus:

Then I put my sights at such an elevation that to hit a small mark at a short distance, say at twenty or twenty-five yards, I must look through the bottom of the large aperture of the Lyman sight and see the top of the front sight just flush with the top of the middle sight, as shown above. By this means I have as good a sight as can be made for shooting at any still game at a short distance.

Now for a running shot, and it is for this that I really want a Lyman sight, I look carelessly through the large aperture, taking no notice of the middle sight and thinking of nothing except to bring the front sight on the object to be hit. It is natural to look through nearly the center of the Lyman sight, giving a little more elevation than at first but none too much for deer shooting. In fact with a good rifle the bullet will hit just where the sight is held at all ordinary distances as shooting is done in the woods. The middle sight will be fairly below the front sight and not in the way in the least, especially when we consider that the gun is always moving upward or sideways, but never downward while aiming at a running deer. The front and middle sights will have this appearance.

Now for a long distance, say for a somewhat long standing shot, and when there is no time to elevate sights, I look through the extreme upper part of the Lyman sight and increase the elevation fully as much as one lift on a common middle sight. This will bring the front sight still higher above the middle sight, thus:

In this manner three different elevations can be obtained without altering sights or taking the gun from your shoulder, and in every case the middle sight is there to show exactly how coarse or fine you are aiming, with—so far as I can see—no possible disadvantage in its use.

There are many advantages in the use of such a sight. If you have raised your Lyman sight for target shooting, the middle sight will show you exactly where to replace it and you do not have to remember what number it was on before you elevated it. Then, if your front sight—or, in fact, any one of the three—gets displaced by an accidental bump, or some one thoughtlessly twists your Lyman sight to a different elevation, a single glance through your sights detects the difficulty. Otherwise you may find it out by shooting over the back of the only deer of the season that stops to look at you.

There are some cases where it is not practicable to use the Lyman sight at all. After it is too dark to see through even the large aperture you can see to shoot a deer at short range, especially if you use an ivory front sight. Then the notch in the middle sight cannot be seen, but the top being narrow and the corners distinct, you can draw over the center of it and shoot quite well, just seeing the top of the ivory sight over the center of the middle sight. This is an important point, as deer often commence moving on their runways just at dark. I have used a sight for three seasons and have made some very quick running shots with it and can recommend it for all kinds of shooting that I have ever tried.

BACKWOODSMAN.

EAU CLAIRE, Wis., Nov. 30.

GAME IN THE PARK.

MAMMOTH HOT SPRINGS, Wyo., Dec. 5, 1885.

Hon. D. W. Wear, Superintendent Yellowstone National Park:

SIR—Having just returned from a trip through a portion of the Park I beg leave to submit the following report: I left this place on the 14th of November, and went as far as Yancy's Ranch that day and camped. That night about 10 o'clock I shot a large red fox, which had come down from the mountain to regale himself on some of Yancy's fine chickens. The next morning I proceeded on my way to Soda Butte, and camped there that night with Jack Baronett, who had just returned from a trip over on Slough Creek, where he reported all quiet and no depredations being committed. I remained at Soda Butte two days reconnoitering the country in that vicinity; and on the 18th of November left there in company with Assistant Superintendent Fish, and went about eighteen miles and camped on Miller Creek, where I found Bill Wilson, a hunter, camped just outside the Park line. About ten miles from Soda Butte, near the mouth of Calfee Creek, I ran on to a band of ten elk and saw signs of quite a number in the snow, all heading in the direction of Specimen Mountain. I remained in camp with Bill Wilson four days and scouted the country in every direction, and then went about four miles further and camped on Burnt Creek.

The next day (Nov. 26) I went up on the top of Saddle Mountain, and Fish went down on the east fork of the Yellowstone and found Horn Miller, Woody and Renfro, hunters, camped just outside the Park. They stated that they had been out eighteen days and had not killed game enough to supply their own wants, having killed in all only three deer, and were then on their way home empty-handed. The next day (Nov. 27) I started in the direction of Green Creek, and Fish started back to Soda Butte. I went across the range toward the head of Pelican Creek, where I went into camp that night about 10 o'clock. Just before going into camp I ran on to a large band of elk coming down from the mountain and heading in the direction of the basin. The next morning (Nov. 28) I arose bright and early and could see feeding on the hills bands of elk like droves of cattle and as tame; conclusive evidence to my mind that they had not been hunted or molested for some time. I broke camp about 8 o'clock and started for the Yellowstone Lake. About seven miles distant from camp I ran on to a band of seven buffalo heading in the direction of Specimen Range. A little further on, in a swamp, I ran on to a band of five moose. I went on about twelve miles further and went into camp. I saw elk all along the route during the day in every direction.

The next morning (Nov 29) I started in a southerly direction, heading toward Brimstone Basin, and saw plenty of buffalo sign all along the route. The next day (Nov. 30) I traveled down the Yellowstone Lake in an easterly direction. The lake was literally covered with geese, ducks and swans all the way down. I camped that night just east of the lake on the Yellowstone River, having traveled about twenty-five miles. The next day (Dec. 1) I forded the river about three miles below the lake, and saw a large band of elk on the east side just after crossing. I struck the wagon road leading from the Yellowstone Lake to the falls at this place, and followed it down to the falls, where I arrived that night about 9 o'clock. During the day I saw several bands of elk, and just after crossing the river I found the trail of a band of antelope heading in the direction of Hayden's Valley. I did not see the antelope, but judging from the sign, which was quite fresh, I should think there were about forty in the band.

The next day (Dec. 2) I started in a northerly direction, heading for Mammoth Hot Springs, crossing over Thompson's peak, and camped that night on the head of Blacktail Basin, having traveled about sixteen miles. Found the snow about two feet deep on the range. During the night my horses ran off, and the next morning (Dec. 3) I started in pursuit of them afoot and overtook them about four o'clock in the afternoon. During the day I ran on to several bands of elk, while hunting my horses. After finding my ponies I started for Mammoth Hot Springs where I arrived that night about 11 o'clock, having been out nineteen days. During all this time I saw no hunters or signs of hunting in the Park, and think I am fully justified in saying that there is more game in the Park now than was ever known before at this season of the year. The few hunters that I met on the trip were returning from the chase empty-handed and complained bitterly of the scarcity of game. I saw no game of any kind outside of the Park. Respectfully submitted.

ED. WILSON, Ass't. Supt. Y. N. Park.

CAPE COD DEER.—Recently in West Barnstable, Mass., a deer, driven by a dog, dropped exhausted in the orchard of Mr. A. J. Howland, near the depot. Closer examination revealed shot marks, and as the animal seemed to be suffering it was killed by those who saw it. The dog, which was allowed to depart, wore a collar inscribed "Fish, Greenville, Mass." As the statutes prohibit the hunting or killing of deer, it is a much-discussed question among our local wiseheads as to who should be holden for breaking the laws, the dog, its owner, or those who killed the deer?—A. B. C.

A CRUISE FOR GAME.

ON a beautiful morning in October three of us started on a cruise from one shooting ground to another, as game and our inclinations led us, for four or five days. We hoped in this way to pick up a few birds. We took two canoes, our camping gear and three Clumber spaniels, Drake, Madge and Johnny, which were all trained as duck retrievers, as well as field spaniels, H., V. and myself being their respective owners.

A good breeze was blowing. We hoisted sail on the Mud-turtle, lashing alongside the small canoe, the Scaup, which had no sail. It was very cold, and we felt the benefit of our heavy shooting coats and woolen gloves. The wind was strong, and the current with us, so, speeding a little with the paddles, we got on very fast, and in four hours reached our first stopping place on the island.

By the time we had pitched our tent and got in wood for the night it was almost dark, but we took our guns and managed to knock over a brace of snipe, and had a chance at a woodcock, which, to our shame be it said, we missed. Ducks, we decided, had left for parts unknown before our arrival, as not one was seen all the evening. It was very hard to find good hard logs for our fire; all the dead trees near the camp had been chopped up and burnt by campers during the summer, the islands being a favorite camping place. However, we managed to make up a good fire for warmth and cooking. There was a hay-stack a few hundred yards away, and with a few armfuls of hay under us, we had a bed fit for a king, and after chatting for a while fell fast asleep.

Before daybreak next morning H. went in one direction and I in another. After tramping for an hour or more without seeing a feather I began to feel discouraged, and was thinking of going back to camp, when I heard the whistling of a yellowleg and answered back to him. He was very shy and took a lot of coaxing; but at last came up, and as he flew toward me was joined by another. As they crossed in front of me over the water, I dropped one which Johnny retrieved. I had marked the other one down, and going over to where he was, managed to drop him at long range and the dog retrieved him.

On my return to camp I found H. had only seen one snipe, which he bagged. We were much disgusted at the scarcity of birds, but decided to stay there one day more, and give the islands another chance. After breakfast we took the dogs and gave the covers a "rustling" for cock, but did not find any. Our friend of the evening before seemed to have left for a change of air. H. and I then took the large canoe and Johnny and Drake, and went down to the sand bar at the end of the island, hoping to see some plover, but it was of no use; there was nothing on the bar but crows, in hundreds and in thousands, making a terrific noise. We then tried to find a channel over the bars; there was none, however, and the canoe stuck fast, so there was nothing for it but to get out and pull her across or turn back. We decided on the former and jumped out. It was hard work, as at every step we sank over our knees in the mud, but at last we got into deep water. No better luck was in store for us at the other side, a couple of yellowlegs which we saw being too wild to decoy. After a long circuit we got into the channel leading to the camp. H. landed and walked over a neck of land into a marsh, while I took the canoe down to the mouth of it to meet him there. In a few minutes I heard a shot, and he called for me to bring the dogs. I landed them and they ran over and retrieved a snipe which he had shot, and which fell in the water out of his reach. He got a brace more as he walked down the marsh, these being all he saw.

On reaching camp we found that V. had spent his time in making things comfortable, having made tables and racks for our plates, and brought in more hay, so we were very snug. After grub I took out the decoys and watched them till dark, but did not see a duck, only bagging a snipe which flew over the decoys. It was a lovely evening, and the beautiful, wild scenery fully compensated me for the want of birds. At dusk I took in the decoys and started back to camp, staggering under their weight. The others seeing me with such a load, thought I must have had grand sport, but were much disappointed when they found what the burden was. They had seen no ducks but had bagged a brace of snipe.

Next morning we were up bright and early to pack up our gear for a start. It was blowing great guns right up the river, which always makes a tremendous sea. Just before getting into the canoes a snipe flew past and lit in a marsh a hundred yards away. H. and I took the dogs and went over to try and get a shot. The bird was at long range and H. fired without hurting him. I missed him clean also, but as he passed V. let fly and dropped him beautifully into the water, the dogs swimming a race to retrieve him.

When we reached the main river and saw what a sea was on, we felt rather squeamish about crossing in our heavily-laden canoes. There was no help for it, however, and, making up our minds for an exciting hour, we set to work. As we were passing the sandbars H. shot a yellow plover and another bird which I have never seen before. It was about two-thirds the size of a snipe, gray plumage, with half a dozen feathers like a snipe's on the back, head and bill a cut between a snipe and a plover, gray legs and half-webbed feet. It was swimming when shot. Can you tell me what sort of a bird it was?

It was ticklish work crossing the river, and several times I thought we would never fetch the shore; but at last we reached it, with our canoes half full of water, and coasted down it.

Our next stopping place was B—— Marsh. Before turning into the creek which leads up to the marsh we bought some fine fish from the fisherman who lives in a hut on the point, and these made a welcome addition to our larder. When we had gone a few hundred yards up the creek we saw a snipe flying across. V. went ashore, H. landing on the opposite shore. Then the fun began. Snipe rose on every side. H. knocked over a couple, V. and I getting one each. We saw that we had "struck oil," as it is very seldom that one can find a flight of snipe in this country. I landed with the dogs, and in a few minutes bagged another brace. The birds now seemed to think that it was getting too warm for them, and all went over the trees out of sight. We paddled on, and soon found a very good camping place on a point well sheltered and affording plenty of wood for our fire.

The tent was pitched, the gear brought up, and while our dinner was cooking H. took the dogs and worked the marsh opposite the camp. Thinking he might send some birds down past the camp, I took my gun and stood on the point, hoping to get a shot. Soon the dogs put a snipe up, which he did not fire at. The bird flew past me at long range, but I fired and "spun" him into the water, where Johnny swam out and retrieved him.

After dinner I took my gun and the dogs and worked the marsh opposite the camp. It was not long before the dogs put up a snipe, which I missed, in the most beautiful style, with both barrels. But my misfortunes were only beginning, for I missed half a dozen more of the easiest shots. The other fellows were watching me from the camp, and added greatly to my discomfiture by asking me if I thought I could hit a haystack flying.

While I was away shooting H. had put out the decoys and made a blind on a point. I paddled V. up the marsh to try for duck. It was very hard work, as I had to push through the mud with a paddle. After going half a mile up the marsh we pulled the canoe up to the bank, and I got out, meaning to walk up the marsh and drive any ducks there might be down to V. and H. Snipe were getting up all around me, driving Johnny nearly crazy, as he couldn't understand why I didn't shoot, but it was too dark. It was fearful walking, as I had to jump from tussock to tussock, and it was so dark that I sometimes missed my jump and went into the mud, nearly over my wading boots. After walking, or rather jumping, for about a mile I heard a faint "cooey," and then another. I thought it was V., so whistled back. But as he kept on shouting and whistling I turned and hurried back. A few moments later he fired both barrels in the air. I answered the signal and hurried on. On reaching the canoe I found him in a terrible state of anxiety. The wind had been blowing from him to me, so while I could hear his shouts he could not hear mine, and he thought all sorts of dreadful things had happened to me, as the marsh is a very dangerous one and I might have lost my way in the dark and never have turned up again.

It was very hard to find our way out of the marsh, but the camp fire luckily had not gone out, so we steered for it and at last reached camp. H. had shot a couple of ducks while we were up the marsh; he had seen very few others.

After dinner we took out our cartridges, as we proposed having a good day after snipe on the morrow. To our dismay on examination, we found that we were nearly out of snipe cartridges, and would have to depend on duck cartridges for snipe, which was pretty hopeless work. However, we divided them evenly, deciding only to take sure shots, and to hold as straight as we could. For every No. 10 cartridge we had a snipe was brought in next day, the No. 5's, however, did not do so well. We turned in early as we had had a hard day and were very tired.

Next morning I set out to walk to the head of the marsh, taking Johnny with me. I crossed the channel in front of the camp in the canoe, and walked up into the woods. After going some distance I heard a noise in the bushes, and, on turning round, saw a huge white bull making for me. Everything was forgotten, and I ran straight ahead, my one idea being to get to a different place from the one in which I was at that moment. I was not dressed for running, my long hip boots, cartridge vest, gun, and heavy clothes hampering me greatly, but fear lent me wings, and I ran like a deer, and soon eluded my angry taurine pursuer. I was too much blown to walk round the marsh, so giving the bull a very wide berth I went back to camp. On my way down Johnny sprung a snipe, which I bagged. H. had shot one duck, the only one he had seen, and V. had nothing.

After breakfast we started out to try for snipe, V. went up the big marsh, taking Madge with him, while H. and I took the two dogs and worked the smaller marshes. We had very good sport, getting seven and a half brace. In the afternoon H. and V. paddled to a village about three miles down on the main river, to get some needed stores. I put out the decoys and hid on a point where the trees and bushes came down close to the water's edge, making a splendid blind. It was a lovely evening and I soon forgot all about watching for ducks in my admiration of the scenery. The sun was setting over the tall pines at the head of the marsh, making a very wild and beautiful picture. Just at dusk a duck flew past, which I stopped, and Johnny swam out and retrieved it. The water was bitterly cold and I heartily pitied the poor dog, as his wet coat was freezing hard. H. and V. now paddled up, having had a hard paddle. I jumped into the canoe and ferried myself over to camp.

My first duty was to warm and dry the dog, so I took him in front of the roaring fire, rubbed him down and poured some whisky down his throat, which soon warmed him up. Some people will smile at the idea of taking so much trouble about their dogs, and some will not even let their dogs lie near the fire, but dogs treated in that way are pretty sure to become useless in a few years from rheumatism, and any one who really loves his dog could not bear to see him shivering, wet and cold, when he could easily make him comfortable.

After dinner we sat in the tent, with the tent door open and the fire blazing in front, yarning and taking it easy. V. has shot for more than thirty years over the best shooting grounds in British North America, and his stories are many and varied.

There was a hard frost next morning, and it was very cold, so I did not feel inclined to get up early. H., however, went out and in an hour came back with a brace of snipe. H. and I took the canoe and paddled down the creek, hoping to find some birds on the shore, as we thought they had been frozen out of the marsh by last night's frost. We saw several, but only managed to get a shot at one, which was bagged. When we were landing at the camp, H., being in the bow, got out first, and just as I stood up to get out he gave her a pull, the canoe tilted over and out I went, gun and all. Luckily the water was not very deep or I would have been drowned, as with all my things on I went down like a stone. With great difficulty I managed to get ashore, wet through and through. All my shooting paraphernalia were wet, so I could not go up the marsh with the others, and stayed in camp to pack up. I wanted one more crack at a snipe before going, so I took my gun and calling Johnny walked along the shore; the dog soon sprung a bird which was knocked over. H. and V. had returned to camp while I was away; they had only shot three.

We all set to work to strike camp, and after a hearty meal got into the canoes, and said "good-bye" to as comfortable a camp ground as it has ever been my fortune to find.

The main river was very rough, and it was nervous work crossing, but we reached the other side without any mishap, and paddled down to C., on the wharf of which, after much trouble, we stored our canoes and gear. As the steamer was not due for a couple of hours we made ourselves comfortable on the wharf, surrounded by the usual crowd of gaping country people, who are always much surprised at seeing "three dogs all alike," and if they "is good fur runnin' deer" or are "good patridge dogs," are questions repeated and answered every few minutes. At last the boat steamed up to the wharf, and, following our traps on board, we bade farewell to camping for a year. F. M.

CANADA.

VERMONT DEER.

Editor Forest and Stream:

Looking over your Dec. 3 number I find you have been misled, as have been the people living away from northeast Vermont and not familiar with its surroundings. The forest there is connected with the deer-inhabited forest of Canada, and within four weeks two deer were killed near the border there, driven by dogs into Averill Pond, Vt. Below this place the same primeval forest extends within fifty yards of the Connecticut River, and the unbroken forest stretching across the State of New Hampshire on the opposite side of the river, near Simm's Stream, about 1,200 yards distant. The stream is a trout brook with its alder banks to complete the noted old deer runway, on which some fine specimens have taken their last run. Next, this forest in Vermont, and cut in halves by the Grand Trunk R. R., is forty miles long, and about fifteen miles long in its greatest width. As long as a deer remains in New Hampshire, Vermont will have some. This near forest growth is on the Granite Mountains that defy the settler, and is the home of all that is near the sportsman's heart in our northern wilds. I have seen caribou tracks in Vermont, but one cannot be sure to always find them there, with their roving habits and forest connections with New Hampshire and Canada.

When that Vermont law was enacted there were deer enough in Essex county, Vt., to number them in hundreds, and the like may be told of them to-day. Now, why should this county be subject to the State law, unless those "public spirited gentlemen" wish to share with Noah the credit of supplying the universe with venison? I think if the deer law there ever gains friends, it will be created by an open season. If one fair-minded law is enacted there at the next session of its Legislature, I will agree to aid in its being enforced, not as one away, but as one resident, for I am devoting my daylight hours to that end on that side of the river. If some others will do better, I will remain a silent citizen, wishing the deer better success than they are getting trying to avoid crust-hunters and dogs. NED NORTON.

COLEBROOK, N. H.

DEER IN MICHIGAN.

Editor Forest and Stream:

A short time since I returned from a hunting trip on the Upper Peninsula of Michigan, where, with a party of six, I had a splendid time. We were camped on a chain of lakes on the headwaters of Fox River, as it is called (I think it should be called Manistique, as it is really the river that has that name) where it empties into Lake Michigan. This stream a few years ago was noted as a trout stream, the fish being of great quantity and large size; now the residents and lumbermen say trout are very rare in the main stream. The east branch, which crosses the railroad near McMullen, is still well-stocked with trout of good size. In the main stream near the extreme head or above where it has been used for driving logs also large quantities of trout are still found.

If it is possible for trout to live where there are pickerel—as they are called—and muskalonge grow to an immense size, the many lakes in the vicinity must be well stocked with trout. I saw quite large numbers of very large trout in some of the small spring branches. I inquire of numerous log drivers if they observed many dead trout while driving the streams, the universal answer was that they did not. When they first went there the main stream was full of trout, but log-driving had driven them out altogether, as they are rarely now seen. So far as I could learn, all the small streams along the line of the Marquette Railroad are alive with trout, and large ones too. Parties desiring good trout fishing in season would not miss it on any of the small streams between the Straits of Macinac and Lake Superior. Lumbermen say that trout fishing is good all along the coast of Lake Superior, from Whitefish Bay above the Sault St. Marie, to Marquette, where rocky shoals are found. The whole Upper Peninsula is or was a paradise for trout and will be for many years to come, especially in the streams that empty into Lake Superior.

It will take but a few years at the present rate to clear the Upper Peninsula of all the timber of value. As soon as the streams are no longer used for log-drives they will at once become restocked, when fishing and canoeing will be very fine. None of the streams are very rapid. So far as my observation went, they appear to be connections to chains of small lakes, beaver dams and marshes, and if it is possible for trout to live in the same waters with such sharks as pickerel and muskalonge, all the lakes and ponds must be well stocked with them; but as they were not biting, I could not tell. I caught pickerel and saw several large muskalonge. I did not see any bass, but believe they are plenty in some of the larger lakes.

Deer are plenty and of very large size, ranging from 100 to 350 pounds. I succeeded in bagging a 200-pound doe, the largest I ever saw. Ruffed grouse and spruce grouse are very plenty; in fact, the "woods are full of them." Wolves are also quite numerous, and a few black bears are found of immense size. Bob cats and Canada lynxes are in fair numbers. In the cedar swamp large rabbits are very numerous; how they escape being devoured by the wolves, lynxes and cats is certainly a mystery. Along the marshes of the streams are evidences of many hermit beaver; in some places I thought there might be five or six together, but a genuine colony I hardly think exists there.

For the past seven years I have visited Michigan, either on hunting or fishing trips, every year but one. About the first effects of the non-export law was that it destroyed the market for game or it required but a few deer to overstock all the markets within the State. Parties told me that four or five years ago deer shipped from the north shore to Detroit did not sell for enough to pay the freight. This year I noticed every train going south would have nearly a car load of deer. Upon inquiry I found the bulk of them consigned to Detroit. I also learned from hunters who hunted between Manistique Lake and Lake Michigan that they sold all the deer that they killed in Detroit at from nine to eleven cents per pound, also that several cargoes were loaded on boats direct for Chicago. The shipments of deer on boats from the Lake Michigan or Huron shore were the only open violations of the law that I heard of, except what outside hunters succeeded in smuggling through with their baggage. Now the question is what becomes of the deer—from one to two hundred a day—that found a ready market in Detroit this year at from nine to eleven cents per pound? I heard the amount estimated at that number by several parties who were in a position to know.

The object of the non-export law was certainly for the protection of the game. The results (and I believe it is true with nine-tenths of the game laws of this country) are the protection of game dealers. No one, certainly, believed the

vast quantity of venison shipped to Detroit this year was for home consumption. The fact is that the deer, as soon as they are received in Detroit, are frozen solid and packed away in refrigerators, to be shipped at pleasure to such markets as pay best.

Such are my observations of the working of the non-export law, and as soon as it is generally known to market hunters that within the State of Michigan a ready market can be found for game at a fair price, the day of the deer of the State are numbered. Like the buffalo of the West, they will be of the past. With a good market in Detroit, the hired hunters of the lumber camps, the indiscriminate slaughter in season and out of season by the settlers, will soon tell the tale with the deer, so far as Michigan is concerned.

I leave it to wiser men than myself to suggest a remedy. To be of any value the remedy must come soon. To be effective the treatment must be heroic. CALIFORNIA.

COLUMBUS, O., Dec. 1.

GEORGE H. FERRIS.

GEORGE H. FERRIS, one of the pioneer gunsmiths of Central New York, died at his home in Utica yesterday, aged 66 years. Born in Willowvale, Oneida county, N. Y., he became a resident of Utica in 1850, where he made his home. Mr. Ferris's reputation as a gunsmith and skilled mechanic was second to none in this country, and his fire-arms are known not only throughout the United States, but in many European countries. It was the quality of the guns he produced rather than the quantity which established his reputation. When but a mere boy he evinced great aptitude as a mechanic, and made a study of every piece of machinery he saw. When he first came to Utica he engaged in the gun business with Morgan James, the venerable gunsmith, who died some years ago. Gunmaking came naturally to Mr. Ferris, and he made the first rifle he ever fired. Understanding the machanism of guns thoroughly, he also became a very expert workman. Mr. Ferris was the first man in the United States who made long-range rifles, and who succeeded in making large-bored guns that would shoot accurately. By increasing the size of the bore of a rifle near the breech it was made to hold more powder, and consequently to carry further. A large and heavier ball was carried, and this had the advantage of not being deviated by the wind. His improvements in this direction may be said to have revolutionized the manufacture of firearms. Mr. Ferris made few if any breechloading rifles, even in later days, as he ever maintained that muzzleloaders were more accurate and would shoot stronger.

In 1857 Mr. Ferris started in business by himself. Many years ago he manufactured long-range rifles for shooting turkeys at 150 rods. His long-range guns were known before those of Sharp, Remington and Berdan. He made some of the finest muzzleloading rifles in this country, for which he received $200 each. One of these in the hands of Dr. Pardee, of Oakland, California, made the shortest string on record at forty rods: Ten shots were fired at the target off-hand, and the aggregate distance from the center of the target to the center of bullet holes was four and one-eighth inches (considerably less than half an inch on an average). Mr. Ferris's son still retains the target. Mr. Ferris was the inventor of a breechloading shotgun which he patented, and of which he sold many. Some of these guns sold at $400.

During the war he invented a breechloading rifled cannon. He made a 1,500 pound gun which was tested in Washington in the presence of President Lincoln, Secretary Stanton, Admiral Dahlgren, and others. It carried a ball nine miles and drove a steel bolt through three inches of iron. It was afterward taken to France, where it was captured by the Germans during the Franco-Prussian war.

He was very ingenious and a hard worker. He was recognized as an authority on firearms and mechanics, and many inventors and experts came to him for advice. He was often called as an expert to testify in cases of death from gunshot wounds.

He leaves a widow and one son, G. Fred Ferris, who was for three years a member of the Ilion rifle team. PONTSA.

UTICA, N. Y., Dec. 14.

EXCITEMENT OF ANTELOPE HUNTING.—Cleveland, Dec. 9.—It has often been a surprise to me that among the stories written by hunters in your paper there are so few that say anything of antelope hunting. The article of Mr. Woodrow takes me back to my old home and cowboy life in Kansas. I was located for several years in Southwestern Kansas, and many a day have I spent crawling through those draws and over the divides, with the perspiration streaming down my face and my heart going like a triphammer at the prospect of a fat antelope as a reward. It is, I think, the most exciting of sports, for, as frequently occurs, the work must all be done in plain sight of the game, and if there be more than one antelope there is hardly a second that one of them is not on the lookout. I have usually found it comparatively an easy matter to get within range of a single buck, especially an old one; and I have often crawled within fifty yards of one and then lain and watched him several minutes before shooting. It is very hard to drop an antelope in its tracks. Three points, if struck, will prove fatal—the head, heart and spine. I once saw an old buck get on to his feet and stand long enough for a dog to run a hundred yards and pull him down, after he had been shot squarely through the heart and that organ had been literally torn to pieces. Usually when hunting antelope I took with me a pair of greyhounds to catch any wounded game, for I never liked to have a crippled animal to suffer and die a lingering death. At some future time I will give some of my adventures with rifle and greyhound, and hope they may prove as interesting to some of the readers of the FOREST AND STREAM as the stories of other writers have been interesting to me.—EX-COWBOY.

IS A THREE-YEARS QUAIL LAW DESIRABLE?—*Editor Forest and Stream:* As a rule the sportsmen returning from quail shooting trips this fall are disappointed in the season and report the coveys very scarce, even in sections where they confidently expected to find some sport. The truth is our game supply is disappearing more rapidly than we realize and quicker than we care to confess, and the time has come when something more than preaching game protection must be done—action should be taken. I for one am in favor of prohibiting all shooting of quail for a period of three years, as was done in the State of Ohio some time since and resulted in so much good. There are many more Pennsylvanians, I am sure, who would be glad to give up quail shooting in this State for a time if it would do any good.—HOMO.

THE ENGLISH LAKE CLUB.—Chicago, Ill., Dec. 7.—*Editor Forest and Stream:* I notice in your paper of Nov. 5 an article from Dan Johnston, headed "Slaughtering of Ducks at English Lake." I do not want any newspaper controversy, but desire simply to refute his statements, which are false in every particular. They simply go to show the animus of the man, because the organization he refers to has purchased all the shooting grounds and made a preserve, to the exclusion of Mr. Johnston and others, who have been in the habit of bagging from six to one dozen ducks per day for a number of years past; and now that others have been a little more fortunate as to the amount of game bagged, either by their superior skill or otherwise, Mr. Johnston seems to be jealous. He attributes the success of the club members to the fact that they are in the habit of driving the ducks from their feeding grounds as early as 4 o'clock in the morning and preventing them from returning until 8 or 9 at night. This statement must seem absurd to those who are conversant with duck shooting, for during the shooting season no one can see to shoot at 4 in the morning, neither can they at 8 or 9 in the evening. But this organization has a very stringent rule which prevents its members from shooting game before sunrise or after sunset. As bad as Mr. Johnston would have the public believe these gentlemen to be, they were never so anxious to make a big bag of ducks as to stay on the marsh so late at night that the lake's freezing over compelled them to stay out over night almost in sight of their hotel, as was once the case with Dan Johnston and a friend of his. Mr. Johnston further says that this organization has posted the land they claim to own and all they expect to own, warning others from shooting thereon. Why should they not have as much right to post a shooting ground that they have bought and paid for as the farmer has his farm lands from poachers? I venture to say that if this man, in connection with his pusher, Frank Simpson, of English Lake, were guilty of mutilating the trespass signs on farm lands in the State of Indiana as they were the day they delighted in shooting down our signs with a rifle, they would be made to feel that the strong arm of the law knew how to deal with such vandals. Any man who would be guilty of such an offense has no claim to the title of sportsman.—JOHN J. GILLESPIE, Secretary.

WILDFOWL NOTES.—Philadelphia, Dec. 13.—Many wild geese passed down the New Jersey coast last week, and fresh arrivals of the same fowl were reported at Sinnepuxent Sound. Many were killed at the latter named place, and will use these grounds until shut out by the ice. Yesterday William Grant found the capsized sneakbox of William Ridgeway in Oyster Creek channel. The mailbag was secured in its customary place, but no trace or tidings of the missing man could be found. The bay was foggy on Thursday afternoon, and occasionally the wind blew hard, and the conclusion is now reluctantly reached that Ridgeway was drowned when his boat capsized. Duck shooters who visited Barnegat Bay will know the value of Ridgeways services, and will miss him greatly. Our river Delaware still continues to be the tarrying place for many mallards, and notwithstanding the continued wintry weather, we are having these fowl remain with us—indeed, their numbers seem to increase. Last season, long before this they had left for the south, and the weather was even milder. Can any one explain why this late stay? Canvasback ducks are scarce at Havre de Grace. The ice, which has been making on the flats at this point, has greatly interfered with battery shooting. Blackheads are plentiful and wary.—HOMO.

LITTLE ROCK, Ark., Nov. 14.—The prospect for duck shooting around here is not good. There is very little water and no mast, so that the most of them have left for better pastures. I was over on St. Francis River last week to see the squirrel migration. The papers have been full of stories about killing them by the wagon load with clubs. My advice to the hunter is to take the best gun he can get as they have been shot at until they know perfectly well what it means. There are plenty of them. I watched one cornfield, and in the day got four turkeys and thirty-nine squirrels. I could have killed more squirrels, but am opposed to killing more game than I can carry out to my friends. I got off at Wideners, but any station on the Memphis & Little Rock Railroad east of Madison will do. The Swamp Angel was sentenced to thirty days in the Gross county jail for selling whisky and was also awaiting trial there for murder, but some of his friends cut him out. He is said to hold the Memphis Gun and Trolling Club responsible for his arrest and to be laying for them in the cane. I hope he will not get "Coahoma" the first round. A camping party from here spent last week on White River and killed a large wolf and report game plentiful and bass fishing superb.—CASUAL.

MINK AND WOODCHUCK.—Melrose, Mass., Dec. 11.—While hunting for grouse a few weeks ago in Maine, on coming out of some small pines I found my dog on a point that puzzled me. He was standing on the edge of a ledge and pointing into some small poplar trees which stood on a sidehill below. Of course I expected a bird, but the trees were bare and there was evidently no bird. On calling the attention of my brother, who was not far away, he discovered some animal in one of the trees, which he shot and found to be a mink. No doubt he was driven there by the presence of the dog. Several years ago I saw some object swimming in toward the shore of a lake, which proved to be a woodchuck. The lake was about two miles in width. Whether he had started from the shore at some distance and made a circuit, or had come from the opposite shore, is not certain; but I had watched his progress for an eighth of a mile or more, and think he must have crossed. What could have induced him to take to the water? Was it choice? Do woodchucks abandon their holes in the open fields and occupy holes in the forests during winter?—W.

SOUTH OYSTER BAY, Long Island, Dec. 8.—This has been a poor fall for ducks, but now there are plenty of geese, brant and ducks in the bay, and if we get any south or east winds we will make up for lost time. When the wind was favorable the sportsmen have made some very good bags this and last week.—GEORGE KILIAN.

"SPORT WITH GUN AND ROD."—This is a magnificent volume, nearly nine hundred pages, superbly illustrated, carefully printed, and bound in embossed morocco, being one of the finest specimens of the book-making art ever coming under our notice. The range of the book covers the game animals and fishes of the Continent. "Sport with Gun and Rod" is as handsome, appropriate, and sensible a present as one would wish to give or be given for Christmas. We have put it first among our suggestions of suitable Christmas presents for those who are interested in the recreations of which FOREST AND STREAM treats.

Camp Fire Flickerings.

"That reminds me."

177.

RETURNING from a duck hunt at Reelfoot Lake recently I had occasion to see a curiosity. While waiting at the railroad station at Obion, Tenn., our party was addressed by the station agent, a Mr. Raines, who offered to bet that he had a young man in his office at present who was entirely without arms, and yet could beat any one in the party shooting with either shotgun or rifle, his champion to shoot from a rest and we off-hand. You can imagine that we ridiculed the idea, and doubted the ability of any one handling a gun who had no arms at all. Especially was this done by one of our party, a one-armed man, and a very good shot. The upshot of the conversation was that we requested Mr. Raines to bring out his seventh wonder, which was accordingly done. A young man appeared of apparently eighteen years of age, long and slim, balancing a double-barreled breechloading shotgun on his shoulder, and carrying a game bag to a web strap, buckled quite high up, so he could have access to it with his mouth. His coat sleeves were perfectly empty, not a vestige of an arm, both being lost from the socket or shoulder joint. He was quite bashful and seemed to be annoyed by the crowd which gathered around him, but upon being urged to go through his actions when using the gun and shooting also, he finally consented. The gun was carried on his shoulders balancing, when he saw something he wished to shoot he selected some convenient place to rest his gun, best suited for the game, either fence, log or tree, take aim and fire. But how load, extract, break gun, pull trigger, etc., was the question with us. To break gun he used his chin, also to cock hammers, put in shells with his mouth and extracted the same way. To the triggers a cord was attached, the end of which he would take in his mouth, and gradually tighten on it until he had his aim, when he would pull off. It seems almost incredible to believe that any one so deformed could handle a gun at all, much less successfully, but I saw the whole performance as described and stand convinced. I inquired into the young man's history and learned that he lost his arms at the age of ten years while feeding a cotton gin. He supports himself and widowed mother with the game he kills and never wastes a load of powder. This is explained by the fact that time is no object to him and always makes perfectly sure before chewing his triggers. His ability to kill game was verified by several of lookers on, who had accompanied this unfortunate hunter on his trips. I also learned that until a recent date the party used a muzzleloading gun, which complicated matters still more.

THE NEW YORK FISH COMMISSION.

Editor Forest and Stream:

The following article from the Albany *Argus*, which has already been quoted at length in your paper, will bear a second reproduction:

"On investigation it has been discovered that the terms of office of the Commissioners of Fisheries, with the exception of that of William H. Bowman, of Rochester, have expired. The term is five years, instead of for life, as heretofore believed. The statutes are mandatory on the Governor in the matter of filling these vacancies. The Anglers' Association of the St. Lawrence River has filed with the Governor a vigorous protest against the reappointment or further continuance in the office of Fish Commissioner of Eugene G. Blackford, of Brooklyn, because he is a fish dealer in New York city, and his private business interests are at variance with his public duties and inimical to all true sportsmen."

As to the first portion of this paragraph, relating to the term of office of the Commissioners and the duties of the Governor, it is erroneous in every particular. By Chapter 285, Laws of 1868, four commissioners were appointed to hold office for two years. By Chapter 567 of the Laws of 1870 their term was extended to three years and the Governor authorized to fill vacancies only (not to appoint their successors). By Chapter 74 of the Laws of 1873, the Fishery Commission was continued in office with all the powers conferred by the act of 1868 (that is continued for life). By Chapter 309 of the Laws of 1879, the Governor was authorized to appoint another Commissioner from Kings, Queens, or Suffolk county and supply his place if a vacancy should occur therein. To this position under this act Mr. Blackford was appointed on May 23, 1879.

The acts now in force create no limit to the terms of any of the commissioners, make no provision for the appointment of their successors and provide only for vacancies, and these can only occur through death, resignation or removal for cause, and in the event of any such vacancy the Governor has the power to fill or not to fill it at his option.

The acts above referred to are so clear and explicit that the Governor will not readily assume that he has the power to appoint any new commissioner in the place of Mr. Blackford on the ground that his term of office has expired. He must first remove him.

If, as already asserted in FOREST AND STREAM, Mr. Blackford has incurred the enmity of certain members of the St. Lawrence Association, and as a body it has for that reason been induced by these members to enter its protest against his continuance in office for the reason alleged above, "that he is a fish dealer," then the article does not correctly represent the true reason for entering this protest nor the animus that inspired it. If, however, the reason is truthfully and honestly given, then it is clear that the gentlemen of this association have quite misapprehended the very object for which the Fish Commission was created and the commissioners appointed. They have in fact stated the very strongest reason why Mr. Blackford should be kept in office.

Do these gentlemen suppose that the Legislature appointed these commissioners and have yearly appropriated and put into their hands thousands of dollars of the public moneys of the State, solely or even principally in the interest of anglers? The professional angler is, of course, benefited by this legislation the same as any other citizen, but that is only an incident and not the main object had in view. The original and continued purpose of all this legislation has been to increase and make more abundant the supply of fish food of all kinds, and to aid, foster and protect every public and private effort in that direction. It is at least as much the duty of the commissioners to protect and increase and

so cheapen in price the fish of commerce as to increase and protect the few varieties of fish which furnish sport rather than food to the angler. The taxpayers of this State, who furnish the funds expended by these commissioners demand and have a right to demand that they shall be principally applied for the benefit of the many in increasing the supply of cheap fish food, and if Mr. Blackford, through a personal experience as a dealer in fish as an article of food, knows what will most benefit the public at large in that direction, he is the one above all others to be retained in the position of commissioner.

I have no interest in this matter except that of an angler, I have for many years belonged, and still belong, to more than one angler's association. My opportunities for ascertaining the public sentiment in relation to this question have probably been as great as those of any member of the St. Lawrence Association.

If any one supposes that that sentiment is "setting very strongly" in favor of anglers and fishing clubs, he is sadly mistaken. On the contrary, in that portion of the State where the interests of anglers are the greatest, and the property and franchises owned by them the most valuable, the popular sentiment is in many instances decidedly hostile. It is useless to disguise the fact that the exclusive rights acquired or asserted by anglers in many localities have provoked public criticism and attacks through the press, which have so aroused some communities that they have threatened to combine in opposition, not only to the extension of these rights, but to diminish or destroy the value of those already acquired.

The fish laws of the State guarantee to anglers every right and privilege which they can reasonably demand; the acts above referred to provide for the most liberal distribution of game fish. Neither Mr. Blackford nor any other commissioner could interfere with such rights nor prevent such distribution if he wished to do so. The people are jealous of any further concessions to anglers and fishing clubs. If Governor Hill removes or seeks to remove Mr. Blackford for the reasons given in the protest quoted above, it will be practically an official announcement that the Fish Commission was created and is to be continued in the interest of "the true sportsman."

Such action and such a construction of the law would still further antagonize the public at large against every angler and angler's association in the southern portion of the State, and so would tend toward the depreciation of their fish preserves and property.

Will Governor Hill assume the responsibilities of taking a course which would produce such results just to please a single organization or to gratify a few of its members? The filing and publication of the above protest have now practically placed Mr. Blackford in the position of being the one commissioner who represents and guards the interests of that portion of the people at large who demand the increase and protection of fish simply as an article of food or commerce.

If the Governor now removes or seeks to remove him the public will regard that as the real reason, whatever cause may be assigned. Will Governor Hill assume the responsibility of such a course? ANGLER.

SALMON ANGLING IN MAINE.

WE are permitted to publish the following very interesting letter sent to the U. S. Commissioner by Commissioner E. M. Stilwell of the Commission of Fisheries and Game, Bangor, Dec. 1.

Prof. S. F. Baird:

I suppose the newspapers have reported our success in introducing salmon angling to our Maine rivers. For the last twenty years we have been continually annoyed with the question as to why Maine salmon would not rise to the fly? My continual success in capturing them with the rod, in the waters at Bucksport, where they were parked for spawning purposes, seemed to have no influence in removing the doubt. This year the accumulated presence of the planting of the last few years has settled the question in their minds, by our anglers capturing them in both the Penobscot and St. Croix rivers. Not our skilled anglers alone among whom have been some of our summer tourists, but our work-a-day citizens from bench and anvil, who after a day's toil have rested weary limbs and brain by participating in the ofttimes read-of sport of capturing a salmon on rod and fly. We have always promised them this, but our poverty of resource has protracted the day. The terrible energy of our people in converting the life of forest and stream into merchantable commodities for trade has now given birth to a dawning necessity of planting and restocking both forest and fish, and our Legislature as well as the U. S. Commission of Fisheries, has increased our power of hastening results. The salmon fishery of the State of Maine is limited to the period between the 1st day of April and the 15th day of July. All the salmon that succeed in ascending the river above the dam at Bangor are the spawning fish with the attendant male or bucks. The law is obeyed and can be enforced in tide-water, but above the waters are more shallow, the streams narrow and are accessible at all times day and night. The country is sparsely settled, and is infested by a class of poachers and outlaws, French, Indians and outcasts, who with net and spear and dynamite destroy every breeding fish they can reach.

All that we could do was to plant the few thousand of salmon fry that our slender means enabled us to acquire, and thus simply hold possession of our waters for the salmon. We could only hold a small stock in our river; we could only prevent utter extermination. As the interest on one's capital constitutes one's income, so is good, or bad, or any fishing at all, dependent upon the percentage of the fish that will take the bait or lure. Do you realize the fact that the percentage of fishes that will rise to bait or fly, in the most popular or famed angling resorts, is not one-half of one per cent.? How long would Moosehead or Rangeley or other popular haunts of our anglers retain a fish in their waters were it otherwise? It is the net, and spear, and dynamite only that can exterminate our fishes; fair angling never. The popular cry demanded of us a division of our salmon fry to all our rivers, when the whole of our slender store if concentrated upon the Penobscot River alone would barely suffice to fill the place of the destruction of all our breeding fish by the poachers, after they had reached their spawning ground. At the "Hunt Farm," on the East Branch of the Penobscot, where formerly large numbers were taken in nets, the whole fishery was abandoned as worthless and exhausted, when the whole product of the year was but one salmon. Soon after, in 1876, our young salmon fry from Bucksport began to show themselves in the river, and fishing on the East Branch was resumed and 100 salmon captured at the Hunt Farm. Increased means allowed us to plant increased numbers of young fry in our rivers. To our earnest appeals the U. S. Commision responded generously, and we were enabled to plant our young salmon fry in the St. Croix and Penobscot waters, with a more liberal hand. Our own State then awakened from her blindness and added a few more dollars to our means and gave us a law forbidding the use of nets above tidewater. This enabled us to afford better protection to our spawning grounds, and as a direct consequence our Penobscot waters are teeming with salmon. In September I have seen the basin of water below the big dam at Bangor, fairly alive with salmon, not one fish exceeding eight pounds in weight apparently, and many much smaller in size. Had it not been for the teachings of the U. S. Commission, by its issue of valuable reports, by its distribution of valuable fishes, the consequent interest awakened and discussion arrising therefrom, the Penobscot river, the only great salmon-producing river left on the Atlantic coast of the United States, the sole dependence of the U. S. Commission for its supply of salmon ova to restock the rivers of our country, would now be barren of a single fish. Fishculture and fish propagation and planting is a clear, distinct, unmistakable success in our State, whether it be in salmon planting or in landlocked salmon planting, or in the stocking of our inclosed waters with trout and black bass.

Without the U. S. Commission we could never by individual State effort have been enabled to have supplied ourselves with the ova of the sea and landlocked salmon that is now so economically afforded us by the State Association under U. S. co-operation. The controlling spirit by instruction, by experiment (and demonstrated beyond individual effort, but economically rendered under associate action) has been entirely by the U. S. Commission. All the enterprise and spirit and enlightened action of the day in the farming of our waters to fish production is due to you, sir, or U. S. Commission of Fisheries. Maine has displayed a fearful energy in destroying and marketing her forests and her fish. Forestry or tree culture, and fish culture must now restore and preserve and nurse her wealth. The freight on a single man coming into our State to angle for our trout or salmon or to hunt our game is worth a hundred times over the freight on the fish or game if sent to market and sold. The trout of Rangeley or Mooschead cost the angler at least $10 per pound. The visiting sportsman willingly pays as liberally for his game. Is this not the wiser policy for our State fish and game protection?

Far up in the wilderness, beyond the settlements, our few wardens can afford but feeble protection, and the slaughter on the spawning beds is doubtless very great. Remember our whole appropriation from the State, for propagation and protection of both fish and game, buying all our eggs, paying all our wardens, traveling expenses, law suits, is but $7,500. Mere planting our river with salmon fry without abundant means of protection for the spawning grounds, above tidewater, must prove futile. The spawning grounds of our fish must be held sacred as our gardens and our wheat fields when preparing, or sowed with their crops. If the reverse is to be the rule, then there must be yearly planting of salmon fry, and no breeding on the natural nurseries or spawning beds. Truly yours, E. M. STILWELL.

CASTALIA CREEK.

SPEAKING of the artificial stocking of trout streams, here is a paragraph worth considering. A communication to the Sandusky *Register* gives the following as the total number of trout taken by the members of the Castalia Sporting Club from their fishing grounds for the last six years, the fishing season beginning March 15 and closing Sept. 15, no trout being less than eight inches in length, taken from the stream, and all fishing done with artificial flies:

1880	1,497	trout,	weighing	521 pounds.
1881	1,739	"	"	556 "
1882	1,776	"	"	675 "
1883	2,393	"	"	782 "
1884	2,725	"	"	906 "
1885	3,058	"	"	994 "

J. L. Yale, of Cleveland, made a very handsome catch March 30, 1885, of 26 trout, weighing 15 pounds 2 ounces, the weight of the largest being as follows: One trout 16 inches long, weighing 1 pound 10 ounces; one 14 inches, 1 pound 4 ounces; one 14 inches, 1 pound 4 ounces; one 12 inches, 1 pound. Six trout, average weight, 12 ounces. The average weight of the 26 trout was between 9 and 10 ounces.

Castalia Creek, which is about three miles long and is fed by springs which yield about 250 gallons per minute, is undoubtedly the finest artificial trout stream in Ohio. Fifteen years ago the first plant was made, and up to that time a trout was never seen in the Castalia water. Although various additions have since been made, the fish have virtually taken care of themselves, the abundance of natural food in the stream making any other feeding entirely unnecessary. This record does not show the maximum weight of fish taken, since several trout this past season scored at from two to two and a half pounds. One fish is on record (if I am not in error) at three and a quarter pounds. B.

TOLEDO, Dec. 10, 1885.

PHILADELPHIA ANGLERS.—At many of the up-town wharves of the Delaware River in this city, roach fishing à la Thad. Norris can now be had. Few since the death of Uncle Thaddeus indulge in this passive amusement, as it is cold work, but rather prefer for winter fishing, pike angling through the ice. Most all the New Jersey mill ponds are good waters as soon as ice makes. The Tumbling Dam, at Bridgeton, N. J., and the Washington Pond in Gloucester county, N. J., are fair places easily reached from Philadelphia where pike may be taken.—HOMO.

Fishculture.

Address all communications to the Forest and Stream Publishing Co.

OYSTER CULTURE IN CONNECTICUT.

WE have the fifth report of the Shellfish Commissioners of Connecticut, which shows a material improvement in the production of oysters through proper legislation, and the expenditures of the Commission. One means of improvement has been the law of 1883, which prohibits the dumping of refuse material at certain places, and within prescribed limits, and consequently the beds are relieved from this smothering nuisance. To effectually carry out this law, the Commissioners placed inspectors on all boats engaged in carrying and dumping refuse, who saw that all deposits were made in places where no harm would result to the oyster beds. This plan should be adopted in New York, where the city refuse is supposed to be carried below Sandy Hoook, but at night, and during fogs, the contractors find it convenient to dump their scows long before reaching Fort Hamilton.

The starfish come in for a share of attention. It has been the experience of the more careful of the Connecticut oyster cultivators, that by constantly working over the beds, these enemies of the oyster can be destroyed. Still the case is one where a negligent man may foster starfish, quite indifferent to his own beds, while the starfish may destroy his neighbor's oysters. "The greater area of grounds thoroughly cultivated," wrote the Commissioners, "the less will the starfish abound. Neglected beds suffer the most, and it cannot be repeated too often that the attacks of these pests can only be repelled by unceasing vigilance and industry. No work on an oyster bed pays better than dredging for starfish. When proprietors realize this fact, and the State does what it ought to keep them from breeding in the natural beds, it is believed the losses will become insignificant throughout the State." Last spring a small flesh-colored worm was discovered on the small seed oysters, doing some damage. This created some alarm, but its ravages were found to be much exaggerated. The worm was examined by Prof. Verrill, of New Haven, and found to be the *Sabellaria vulgaris*, which has been figured and described in the reports of the United States Fish Commission, some 13 years ago. The amount of damage done by this sandworm is said to have been very much exaggerated. It may be destructive of small oysters to a certain extent, but the larger oysters resist its action. Of late the Commissioners have heard no complaints about the sandworm. Careful attention seems to have been paid in the determination of the spawning periods of the oysters in Connecticut waters. It begins in July and ends in September; is earlier in shallower waters, later in deep ones, modified, of course, by meteorological conditions. The advantages of an extended cultivation of oyster become manifest, because when the spawning period comes then the spat arising from parents at various depths, stands a better chance of being fecundated.

The great labor of the Commission has been in mapping out some 335,000 acres of water, which extends from east to west some 96 miles, and varies in breadth from three to ten miles, and to give each occupant a proper title to his grounds. This work was necessary because there is a tax imposed upon the oyster beds, which require to be correctly mapped before the taxes can be gathered, and this involved the settlement of disputes and claims which added tenfold to the original work.

The Commissioners take pride in the fact that an increase of ten per cent. in the oyster business has taken place within the past season, and in evidence of this they show figures to prove it. There are now forty-nine steamers engaged in the work, and by improved methods the plague of starfish has been somewhat abated.

"SUICIDE OF TROUT."

Editor Forest and Stream:

Noticing Mr. Mather's communication in your issue of Dec. 10, I will give my own experience. I do not recollect whether it has been stated in FOREST AND STREAM that I now claim to be the senior American fishculturist, having taken my first lesson of Doctors Ackley and Garlick upon the occasion of their initial work. I recollect hearing Doctor Ackley remark to some parties present one day that the trout did not take kindly to confinement in limited space, but were inclined to jump out of such inclosures. I am under the impression that your occasional correspondent, Dr. Sterling, was present at the time. At all events that was my first information concerning this "jumping-out" tendency. My own subsequent and long extended experience in connection with this branch of the salmon family was almost wholly experimental and in limited inclosures, some of which were so constructed that the trout could have readily jumped out if they had so desired, but I do not recall a single instance where they did. After I had in the main discontinued my experiments with brook trout, I experimented quite extensively with salmon trout, landlocked salmon, etc., all of which I believe to be the progeny of true salmon.

The first lot which I had were called "salmon trout" by the party from whom I purchased them. I placed them in one of my trout ponds, the area of which would be about 75x75ft., fed by the purest spring water and containing no fish of any description. When these so-called salmon-trout had attained a length of five to six inches (I do not remember their exact age) I began to find them on the outlet embankment of the pond nearly every morning for a week or ten days. Early one very foggy morning I found several, none of which had evidently been out of the water long. After I had taken my breakfast (perhaps an hour later) I went over to the pond and found two more dead ones and one yet alive upon the embankment. Those of course had jumped out in broad daylight, but it was very foggy. It then occurred to me that I had found more on mornings after night rains. I took particular notice of this fact upon two occasions soon after. Finally, I found no more dead fish, but noticed that they gradually became less and less in number, and in three or four weeks all had disappeared from the pond.

About this time I noticed on two or three mornings, just at daybreak, a large, stray cat making a careful reconnoissance along the embankment. This explained why I found no more dead fish, although conscious of their continual disappearance. Not being at all partial to prowling cats, and still not wishing to kill what might be one of my neighbors, prized pets, noticing that he disappeared toward the village which my ponds outskirt, I determined, notwithstanding, to be rid of the cat, so one morning I took my old army musket and seeded it down well with fine bird shot. I then started out and deployed as skirmisher in the direction of the pond. In a moment I saw the cat rapidly disappearing toward the village. When some thirty yards away I trailed the old musket in the same direction, and applied a gentle three-pound pressure to the trigger. A detonation followed which awakened the echoes of the sleepy village, and as the cloud of smoke passed away I saw about three lofty curves described by the cat passing over the ridge, which would have made a jack-rabbit wild with envy. I have made this little diversion for the purpose of impressing upon the minds of young fishculturists the fact that cats are not desirable adjuncts to experimental work.

The pond to which I have just referred had at one corner a screen opening near the bottom, through which the water discharged, supplying a spawning race some seventy-five feet long which in turn discharged into another pond some two feet lower than the source of supply. This race was sixteen inches wide and perhaps a foot in depth. It contained several little "breaks," over which the water plunged for aeration. I had trout of different ages from time to time in this race. A leap of six inches would have landed them upon the bank, but I never knew one of any age to jump out, while they would jump over the "breaks" continually. A few years after the events just cited, I was actively engaged in the distribution of young California salmon throughout the entire southern portion of New Jersey.

At one time I had some fifteen thousand of these young fish stored in my spawning run, having the various compartments (at the breaks) screened so as to prevent their "herding" too compactly. I soon discovered considerable numbers of the young salmon dead upon the embankment or walk alongside the race, always finding them in the morning. I finally covered the race closely with wide boards, and reported the facts to Prof. Baird, who replied that the U. S. Commission could furnish no solution to this "jumping out" conundrum. In order to reach the extreme head waters of the numerous streams of Southern New Jersey, to plant the young salmon, I had ridden over some rough forest roads and had seriously

THE BLACK POODLE "STYX."

aggravated an old army injury, from which I have suffered since 1863. I was at this time practically "laid up" in consequence.

A day or two after covering the "race" containing the young salmon I sat by a window in my residence looking out upon the pond which discharged into the race and discovered a movement at the head of the race which my failing eyesight could not well define. Upon the secretary within my reach lay that portion of my engineer's level containing the telescope. I picked it up and sighted at the point of interest, at the same time adjusting the focal range, and discovered the little salmon leaping over the projecting planked sides of the pond into its waters, but an occasional one dropping just outside the pond upon the walk, and I could see several of them passing through various stages of their dying contortions.

There was another interested spectator at that point, namely, a ground sparrow, which was plying his little bill actively. I did not stand long upon the order of my going, but hastened over to the pond. My warning foot steps slackened the stream of leaping salmon, but even after my arrival they continued to jump over the plank about six feet in height. In making an examination of the race the previous evening, I had, unnoticed, slipped the board (next the pond) so as to leave a space of about three inches uncovered. Through this space, nearly or quite, eleven thousand of the salmon had jumped over into the pond, which was literally alive with them. I removed the upper compartment to drive those remaining to the lower compartments. As I uncovered the race I found the lower compartments emptied of the salmon, they having leaped over the screens which were barely two inches below the covers. The ground sparrow had picked the eyes out of most of those which had landed on the walk instead of the pond.

As I now had this pond stocked with black bass, it was quite evident that the days of the young salmon in that pond would be few, if allowed to remain there. That indispensable fixture which I term a "collector," and which I now place in all ponds constructed under my superintendence, I had not then devised. All that portion of the pond next the outlet was thin mud, and I had no easy means of getting out the runaway salmon. I therefore placed in front of the gate a screen of sufficiently coarse mesh to prevent the bass passing through but to admit the passage of the little salmon. I then raised the gate and let them into the ditch, which drains my ponds and forms one branch of the headwaters of Manton Creek, discharging into the Delaware

In the Report of the U. S. Fish Commission for 1881, issued in 1884, on page 884, item 13 from the top of the table, will be found the last tidings of this lot of "suicidal" salmon, and this concludes my personal experience upon the subject.

MILTON P. PEIRCE.

PHILADELPHIA, Pa , Dec. 14, 1885.

PROF. HENRY J. RICE, well known to our readers for his work in oyster culture and his contributions upon kennel matters, died at his home, 407 Clermont avenue, Brooklyn, last Monday, Dec. 14. Prof. Rice was taken sick three weeks ago with a hemorrhage of the lungs and afterward typhoid-pneumonia set in. He was unmarried. He was born in Cazenovia, N. Y., March 15, 1848. He began his studies at the Cazenovia Seminary. He was graduated from Cornell University, and, obtaining a fellowship from a prize thesis, spent two years of study at Johns Hopkins University. He also went abroad and continued his studies at Paris. On his return he did some embryological work for Professor Baird at Washington. He then came to New York and found congenial work in the private laboratory of Mr. E. G. Blackford, where his investigations on the natural food of the fishes which come to the market were of great value. When Mr. Blackford was made the Oyster Commissioner of the State he employed Prof. Rice on this work and he did good service both in the field and in the department of embryology. Although not of strong physique he was a member of the Twenty-third Regiment N. Y. S. N. G., and went into camp with them last summer. Personally he was a pleasant and agreeable gentleman who made friends everywhere.

FISH FOR NEW YORK WATERS.—Rochester, N.Y., Dec. 8.—*Editor Forest and Stream:* In behalf of the New York State Fish Commission I desire to announce that I am now ready to receive applications for fish for the purpose of stocking any of the public waters in this State. My order book will remain open until March 1, 1886. I wish to impress upon the minds of all parties wishing to obtain fish for the above purpose the importance of placing their applications on file before the expiration of the above time.—SETH GREEN, (Supt. N. Y. Fish Commission).

FIXTURES.

BENCH SHOWS.

Dec. 15, 16, 17 and 18.—First Annual Dog Show of the Western Connecticut Poultry, Pigeon and Pet Stock Association. Frank D. Hallet, Superintendent, Winsted, Conn. Entries close Dec. 5.

Jan. 5 to 12.—First annual exhibition and dog show of the Central Indiana Poultry and Pet Stock Association, at Indianapolis. J. W. Elliott, Secretary.

Jan. 19, 20 and 21, 1886.—Annual Exhibition and Bench Show of the French Creek Valley Poultry and Pet Stock Association. A. L. Braden, Secretary.

March 16, 17, 18 and 19, 1886.—Western Pennsylvania Poultry Society's Dog Show, at Pittsburgh, Pa. C. B. Elben, Secretary.

March 23, 24 and 25, 1886.—First Annual Dog Show of the New Jersey Kennel and Field Trials Club, Newark, N. J. A. P. Vredenburgh, Secretary. Bergen Point, N. J.

March 30 to April 2, 1886.—Third Annual Dog Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Edward A. Moseley, Secretary, Boston, Mass.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **3092.**

CIRCLING AT FIELD TRIALS.

Editor Forest and Stream:

Your editorial last week in regard to circling at field trials is good, and if a line can be drawn which will prevent a pottering dog from securing an advantage, I for one will be glad to see a rule adopted which will prevent a dog from stealing a point or getting credit for work which should belong to the other dog. This might be done by giving the judges authority to stop one dog while the other was drawing on game, unless both dogs got the scent nearly at the same time, in which case the best working dog would locate the birds first. When a dog in ranging finds scent or points a running bevy, the other dog should be kept back until the birds are located. I would not have a pottering dog that was continually making game keep back another that was a good goer, but I would be glad to see a rule adopted that would give a dog a chance to show himself at his best and not be rattled or interfered with by his competitor. I know that this would make a heat less of a race between the handlers and that the dogs would show better work and make less errors. Hoping that a rule covering this will be made, I am yours truly, W. TALLMAN.

TARRYTOWN, N. Y., Dec. 14.

A BREEDING CONUNDRUM.—*Editor Forest and Stream:* Mr. Wheaton asks me to answer his "breeding conundrum." His illustration undoubtedly refers to my printed pedigree of my beagle Trailer, wherein I state "he is strong in the blood of the Rowett strain." He is one-half Rowett strain and one-half other blood. I consider him strong in the blood of the Rowett strain, as his sire, Racket, contains 87½ per cent. Sam—Dolly blood, which was the foundation of the Rowett strain, and which got most of its best stock. Rosey, Rally and others, and most of the other good ones were either by or out of the direct Sam—Dolly get, as for instance Lee, Rattler and others. Trailer therefore contains 43¾ per cent. Sam—Dolly blood, or nearly as much of it as any of the full Sam—Dolly blood, bred to any other Rowett stock containing none of it, although he is three generations from it direct. I publish the facts (the pedigree from which any one can figure the amount of different blood shown) and add my individual opinion as to the merits of it, and only add it as such. Mr. Wheaton's illustration, however, is not a comparative one He illustrates the inheriting of certain mental characteristics. I referred to the concentration and amount of a certain combination of blood, the origin of the strain as handed down.—HERMAN F. SCHELLHASS.

BLACK POODLE STYX.

[From the American Kennel Register.]

THAT the barber has a good deal to do with the appearance of a prize poodle, our illustration amply testifies. It is that of a black poodle which appeared in a recent number of the *Kennel Gazette*, together with the following sketch of his career:

Styx has seen various vicissitudes of fortune in his short career as a show dog. At Brussels this year, when he was exhibited by M. J. Delin-Jacob, he was unclipped, and his coat was so matted and rusty, and altogether he presented such a ragged, wretched appearance, that he was one of the first to be ignominiously turned out of the ring. His present owner having purchased him, after a fortnight's rest and some hard work at his tangled coat, Styx made his appearance in the Foreign Class, at Waltham Abbey Show, when (under Mr. Taunton) he took first prize, but was subsequently disqualified under Kennel Club new rule XVIII., which forbids poodles being exhibited as foreign dogs. His next appearance was at Brighton, where in spite of his greatly improved appearance Mr. Berrie placed him second only to Mr. Wright's Doctor—no one being more astonished at the decision than Doctor's owner. A month later, however, he appeared at the Crystal Palace, fresh from the hands of Madame Felix, and took first prize (under Mr. Percival) from Punch II., Boy, and his old antagonist, Doctor, who could only get third here, and even the Brighton judge admitted that the dog was rightly placed. Passing on to Ryde Show, he again placed a first to his credit, following this up by winning first prize at Frome last month (under Mr. Adcock), in one of the largest classes of poodles ever seen in the provinces. He is owned by the Rev. Gambier Bolton, of Lee, Blackheath, who purchased him from M. J. Delin-Jacob.

THE EASTERN FIELD TRIALS.

Editor Forest and Stream:

Within the past few days I have received several communications, the writers of which appear more or less anxious that I should join in an attack on the E. F. T. Club, or add fuel to Mr. Anthony's smoky fire. By your permission I will avail myself of the bright columns of FOREST AND STREAM and thus make all of my replies public property. Charitable friends have already circulated the report that I am "pulling the wires," and although this is highly complimentary to Mr. Anthony I doubt whether it will influence his very Graphic denunciations of the unfortunate judges.

The gentlemen who have mailed to me gratis so much valuable advice should remember I am not a chronic "kicker." My prosecution of the Meteor fraud and subsequent investigation of the character of a corrupt journalist were prompted by a sense of duty, and there is no egotism in saying that every reputable owner of dogs derived some benefit from those exposures. But there is a wide difference between prosecuting a criminal and prosecuting an innocent person, and it is better to make sure of your ground before rushing into a discussion, the result of which may show a sad miscarriage of justice.

I did not attend the trials at High Point and I never feel justified in supporting or denouncing the actions of others beyond a point where I am able to advance evidence of a substantial kind in defense of my position. Without allowing myself to be drawn into a fruitless controversy, barren of good results to more than a very small number of persons, I will express my views upon one or two questions.

When the E. F. T. Club invited Mr. Elliot Smith to judge, they committed a blunder that was only eclipsed by Mr. Smith's acceptance of the proffered honor. Messrs. Donner and Coster also "violated the canons of good taste" when they consented to act as judges in lieu of Messrs. Hunter and Smith. And when Mr. Donner undertook the dual role of W. K. C. representative and judge of their dogs, he must have assumed what he knew to be a very grave responsibility. Such things are certain to be condemned by right-thinking folk. For obvious reasons members of the W. K. C. should not judge dogs owned by the club, *i. e.*, themselves. It is not for me to question the correctness of any of the awards, but in justice to the judges I will say that I am informed by those in whom I place confidence, that the work was done in a careful, able and thoroughly impartial manner.

I know very little of Mr. Anthony either pro or con, but Mr. Heath is one of America's genuine dog lovers and is esteemed by all who know him. He loves a good dog not because of any notoriety it may bring him, but for other and more commendable reasons. Mr. Heath was with me in the pointer controversy, and it would be my pleasure to give him a helping hand now if I could do so conscientiously; but I cannot. On the spur of the moment he appears to have acted rashly,

and I should not be surprised to see him come out and say so. It would have been better for him had he conducted his own case instead of leaving it to be crippled by others. Without wishing to antagonize Mr. Anthony, I will say in my opinion he is killing Mr. Heath's case. He starts out with the following strange confession: "Mr. Coster and myself were riding together at the time of the occurrence." It is not quite clear to me why Mr. Anthony was riding with a judge.

Perhaps he will explain the nature of his business with Mr. Coster. Is Mr. Anthony aware that when the New Haven judges exchanged such courtesies as are usually supposed to pass between gentlemen they were charged with concocting a fearful fraud. But Mr. Anthony is allowed to ride with a judge, speak with a judge and even to coach a judge, and the immaculate Western reformer of abuses remains as dumb as an oyster. With Mr. Anthony on one side and "Mohawk" on the other, Coster and Beaufort must have had a rough time of it.

"A very easy way out of the matter," writes Mr. Anthony, "was for the judges to have consulted Mr. Heath." That is just where Mr. Anthony is wrong, and FOREST AND STREAM, which seldom either makes an incorrect statement or indorses one, has fallen into the same error. It is no part of a judge's duty to either consult or inform owners or exhibitors. In ignoring Mr. Heath's letter the judges simply performed their duty, and instead of being censured should be commended. A judge would be justified in not speaking with exhibitors or owners at either field trials or dog shows. Their business is not his; in fact he is not supposed to be acquainted with dogs or their owners.

Rumor said a flush had been entered against Graphic. Mr. Heath's course was perfectly clear. He should have asked the secretary of the club if there was truth in the report. The secretary—I am aware that owing to unforseen circumstances he also was a judge—should have consulted the judges and communicated the result of his inquiry to Mr. Heath. If it was found that a flush really had been scored against Graphic, Mr. Heath, his handler and any witnesses he may have had, should have stated to the secretary what they had seen, and it would then have become the latter's duty to have placed the case before the judges. If their decision proved to be final, Mr. Heath would have been justified in withdrawing his dog—supposing him to have been satisfied in his own mind that the judges' decision was unjust. Was this course followed by Mr. Heath? That is the question. Mr. Anthony says it was not, and if he has stated facts there is not just cause for discussion. CHAS. H. MASON.

BAY RIDGE, L. I., Dec. 14, 1885.

Editor Forest and Stream:

Since writing my letter of the 14th inst. I have learned on unquestionable authority that Messrs. Donner and Coster owed their appointment as judges at High Point to the unanimous voice of owners and handlers who were present. I also have been informed that one of the judges (Mr. Donner) declined at first to officiate, and was induced to reconsider his decision only at the earnest solicitation of the handlers. Mr. Tallman left home vested with *carte blanche* to act as he might deem advisable and best, and a vote cast by him in favor of any judge would be as much mine as his. Such being the case, any and all statements, verbal or written, that have been made by me against Messrs. Donner and Coster's acceptance of the judgeship are hereby most cheerfully withdrawn. If Mr. Anthony was aware of these facts at the time of writing his letters to your paper, his conduct is unsportsmanlike, ungenerous and unjust, and is deserving of very severe censure. CHARLES H. MASON.

BAY RIDGE, L. I., Dec. 16, 1885.

THE WINSTED DOG SHOW.

THE first annual dog show of the Western Connecticut Poultry, Pigeon and Pet Stock Association was held at the Rink, at Winsted, Conn., this week, commencing on Tuesday. Over one hundred dogs were entered, making a fine display, as they were very nicely arranged around the hall, which is large, well-lighted and ventilated, and was properly warmed. The judging was all done at 4 o'clock on the first day. Mr. J. M. Tracy judged the pointers and setters, and Mr. James Watson all other classes. Following is a complete list of the

AWARDS.

MASTIFFS.—1st and special, David Strong's Don; 2d, Diamond Kennels' Tiger. *Puppies:* 1st, G. L. Forkett & Co.'s Bessie; 2d, C. F. Baldwin's Midas. Very high com., Diamond Kennels' Queen.

ST. BERNARDS.—Prize withheld.

NEWFOUNDLANDS.—1st and special, E. H. Welch's Otto; 2d, G. H. Davidson's Bruno.

GREYHOUNDS.—1st and special, Jerry Canty's Carlo.

POINTERS.—*Dogs:* 1st and special, C. J. Peshall's Jimmie; 2d and very high com., E. K. Sperry's Sancho and Dixin. *Bitches:* 1st and special and very high com., L. S. Livesey's Temptation and Lucille; 2d, E. K. Sperry's May. *Puppies:* 1st, E. M. Crouch's Shot; 2d, F. C. Plume's Duke Gasceon.

ENGLISH SETTERS.—*Dogs:* 1st and special, Atwood Collins's Shot; 2d, W. Kirk's Bang. Very high com., E. L. Mead's Macduff. *Bitches:* 1st, S. D. Bingham's Keys; 2d, Diamond Kennels' Lendine. Very high com., H. J. Pierce's Buda. *Puppies:* 1st and special, Geo. Fox's Princess Katie; 2d, P. Hill's Prince Fred II. Very high com., H. A. Bailey's Fleet.

BLACK AND TAN SETTERS.—1st, and special, W. Brown's Gyp; 2d, withheld.

IRISH SETTERS.—*Dogs:* 1st and special, F. S. Parrot's Gerald; 2d, Chas. W. Roedenburg's Chip. Very high com., Isaac Ferguson's McDuff. *Bitches:* 1st, J. C. Lester's Maud II.. 2d, M. G. Wheeler's Choice. *Puppies:* Prize withheld.

COCKER SPANIELS.—BLACK—1st and special, Scott & Crowell's Flirt. OTHER THAN BLACK—1st, Scott & Crowell's Darling; 2d, J. E. Maddra's Kate. *Puppies:* 1st and special and 2d, Scott & Crowell's Black Pete and Shiner. High com., A. H. Norton's Jerry.

FOXHOUNDS.—*Dogs:* Prize withheld. *Bitches:* 1st, Scott & Crowell's Gypsey; 2d, withheld. *Puppies:* 1st and high com., H. Cable's Rover and Fanny; 2d, J. J. LaMontagne's Ring, Jr.

BEAGLES.—*Dogs:* 1st and special, W. S. Diffenderffer's Rattler III.; 2d, W. E. Deane's Little Duke, Jr. *Bitches:* 1st, W. S. Diffenderffer's Betty; 2d, W. E. Deane's Pet.

FOX-TERRIERS.—1st and special, Miss Jessie Coe's Brandy; 2d, withheld.

COLLIES.—*Dogs:* 1st and special, H. Sedgwick's Scott; 2d, W. J. Martin's Rip. *Bitches:* 1st W. B. Barton's Tanzy; 2d, withheld.

BULLDOGS.—Prizes withheld.

BULL-TERRIERS.—*Dogs:* 1st and special for the best dog in the show, Frank F. Dole's Count; 2d, Scott & Crowell's Smasher. *Bitches:* 1st, Scott & Crowell's Sugar; 2d, withheld.

PUGS.—*Dogs:* 1st, Scott & Crowell's Ned. PUPPIES.—1st and special, Diamond Kennels' Susie.

DEERHOUNDS.—1st and special, J. A. Butler's Braid; 2d, W. M. Rankin's The Banshee.

ITALIAN GREYHOUNDS.—1st and special and 2d, J. E. Hair's Posey and Fly.

TOY SPANIELS.—1st and 2d, Chas. H. Crosby's Duke and Ruby.

MISCELLANEOUS.—1st and special and 2d, P. McLane's Russian poodle Joe and Siberian bloodhound Rip.

FIELD TRIAL SCENES.—At the recent meeting of the Eastern Field Trials Club at High Point, Mr. J. T. Walker secured over a hundred different instantaneous views of the different groups of men and dogs. We are pleased to learn from him that he has been very successful in developing the plates and that we shall soon have a splendid series of Field Trial scenes.

THE NATIONAL FIELD TRIALS.

[From a Special Correspondent.]

THE seventh annual field trials of the National Field Trials Club commenced here to-day, with twenty starters in the All-Aged Stake. There was an unusually large attendance of sportsmen from a distance, many coming who had not attended previous trials. The judges selected were Messrs. Joseph H. Dew, of Columbia, Tenn., F. I. Stone, of Chattanooga, Tenn., E. C. Sterling, of St. Louis, Mo., and E. F. Stoddard, of Dayton, O. Messrs. Sterling and Stoddard were not present, and Mr. W. A. Coster was chosen to act in both All-Aged and Derby stakes.

Monday the day was clear and cold in the morning, with a raw wind blowing from the east. In the afternoon the sun shone pleasantly and there was not quite so much wind.

BADEN BADEN AND MAINSPRING.

The first brace down was Baden Baden, a liver, white and tan English setter dog (Lincoln—Blaze), handled by Ellison, and J. F. Perkins' liver and white pointer dog Mainspring (Mike—Romp), handled by Capt. McMurdo. They were cast off in the open at 8:35. Both dogs showed fair style. Going into a plat of sedge grass Mainspring false pointed. Moving on to order across some corn and into the woods he again came to a point, and was backed by Baden Baden. Going on, Baden Baden pointed a single bird. Then Mainspring whirled to a point and was backed by Baden Baden. McMurdo killed, and the bird was well retrieved by Mainspring. Then in a brier patch Baden pointed and was backed by Mainspring. Going into the woods Baden pointed again. The handlers and dogs then got separated. Baden pointed and Ellison shot, but failed to kill. Then Baden pointed again, and held his point for some time for the judges to come up, and when his handler was allowed to put up the bird it did not materialize. The dogs were then ordered up and the heat given to Baden at 9:30. Down fifty-five minutes.

BELLE OF PIEDMONT AND LILLIAN.

At 9:35 Mr. Edward Dexter's black, white and tan English setter bitch Belle of Piedmont (Dashing Rover—Ranee), handled by Capt. McMurdo, and P. H. & D. Bryson's black, white and tan English setter bitch Lillian (Gladstone—Sue), handled by Short, were put down in an open field. Both went away at a slashing gait. After drawing the field blank, at the edge of the wood a bevy flushed wild. In the woods Belle false pointed. Going on the judges flushed a bevy, and the dogs were sent on, and Belle pointed and was handsomely backed by Lillian. A little further on Belle made a false point, then a point on a single bird. Going into a wood Lillian pointed in a brier thicket. Short flushed and killed. To order, Lillian retrieved the bird in good style. In the same wood Belle pointed. Then in the open Lillian came to a point on a single bird. Soon after she pointed again. Then Belle came to a point, followed by a point by Lillian. Short flushed, shot and killed, and the bird was retrieved by Lillian in splendid style. The dogs were then taken up, and after the judges had consulted they were ordered on again. A large field was drawn blank. Going into a glade Lillian pointed. Then in the woods she pointed again, but the birds could not be flushed; but five birds were afterward gotten up by spectators from near the same place. In the woods beyond Belle pointed. They were then ordered up, and Belle to be allowed opportunity to retrieve before awarding her the heat. Taken up at 11:50. Down two hours and fifteen minutes.

COUNT NUTT AND JUNO A.

Dr. Edward von Dunhoff's red Irish setter Count Nutt (Rob—Babe), handled by owner, and Memphis & Avent Kennels' black and white English setter bitch Juno A. (Druid—Ruby), handled by Avent, were cast off in sedge grass at 11:55. Juno showed the better pace and style. They drew south through the sedge into a cornfield, then swung round toward the east and then north, the wind blowing strongly across the field. Going on, Juno was lost and when found was pointing a bevy in a plum thicket. Avent flushed the bevy and winged a bird which got away in the thicket. Count then flushed a bird and Juno followed suit. Then she dropped on a single bird, which was flushed and killed by Avent and retrieved *secundem artem* by Juno. She then pointed again, the bird was flushed, but not shot at. The brace was ordered up at 12:20 and Juno A. wins the heat. Down twenty-five minutes.

Belle of Piedmont was then put down to be allowed an opportunity of retrieving. Bird found, flushed and missed by handler. Then another was missed twice. Short then tried his hand a couple of times without getting a feather. A bird was then thrown, a gun fired, and the bitch allowed to retrieve, which she did in good form and won her heat.

QUEEN BESS AND REBEL WIND'EM.

An adjournment was then made for lunch, after which the English setter bitch Queen Bess (Gladstone—Donna J.), handled by Nesbit, and Memphis & Avent Kennels' black and white English setter Rebel Wind'em (Count Wind'em—Norah), handled by Avent, were cast off in a cotton field at 1:15. Rebel was imported by Mr. J. C. Higgins. He is still a little lame by reason of having one of his toes broken, and has been able for the past six weeks to do but little work. He is a grand dog; a nice, smooth, easy goer; quarters and ranges well; is staunch on his points, prompt and obedient. The bitch is nice, moderately fast and stylish. They got away in good shape, and soon after starting Rebel made a point, but moved on, and Avent coming up, flushed a large, scattered bevy behind the dog. The birds were marked down near a garden and the dogs sent on. Coming up, both dogs flushed. Rebel then pointed a bird through a thick bois d'arc hedge, the bird was flushed, but could not be shot at. He then pointed another bird through the same hedge. Bess then pointed a single bird, which was shot by Nesbit. The bird fell near Rebel and both dogs broke shot and made a run for it. The dogs were then put into a garden in short grass, where Rebel flushed down wind and then made another flush with the wind in his favor. Going into the woods, he found and pointed a bevy, and was backed by the bitch in grand form. The birds flushed before the handlers got up and were not shot at. They flew over a hill and could not be marked down, and were not found again. A cornfield and strip of woods were then drawn blank, and in a field beyond Avent walked up a large bevy in a strip of crab grass. The birds went down in some thick switch cane and briers along a ditch, where a single bird was pointed by Rebel, the bitch backing him. He pointed soon after in sedge grass on the edge of cane, where Avent shot and killed, but the bird could not be retrieved from the thick brush. The dogs were then ordered up at 2.15 and Rebel Wind'em declared the winner. Down one hour.

GLADSTONE'S BOY AND BOB GATES.

The next brace down was Dr. Ware's black, white and tan English setter dog Gladstone's Boy (Gladstone—Sue), handled by Tucker, and B. M. Stephenson's black, white and tan English setter dog Bob Gates (Count Rapier—Belle of Hatchie), handled by owner. At 2:20 they were sent away in a cornfield. They both got off at a rattling pace, which hurried up everybody. In speed and style they were pretty evenly matched. They ranged well and drew the field blank. In some sedge grass on a hill beyond the field both dogs came to a point on a bevy, which flushed wild, and was not shot at. Bob going on, pointed a single bird, which was not shot at. Ordered on he pointed again. Stephenson flushed the bird but failed to kill. Then the Boy whirled to a point in the leaves. Tucker killed, and to order the bird was retrieved in splendid style. Going down to the edge of a hollow Bob made a magnificent point, tail up and head turned to one side. The Boy backing him from the front in grand form. It was one of the very best points made so far, and the attitudes of both dogs were so striking that an artist, Mr. E. A. Watrous, came up and made a pencil sketch of the dogs. The dogs were held so long for the artist that when Stephenson was ordered to flush the bird it could not be found. A little beyond the Boy came to a point, but Tucker failed to kick up a bird. On the edge of a field a little further on both dogs pointed down cotton rows ten or fifteen yards apart. Stephenson shot and missed. The judges gave the Boy a flush. As I saw it one bird hopped up after he had established his point, and dropped down again a few yards off. Then Bob pointed but the bird could not be got up, although one flushed near the same spot a few minutes afterward. Then on the edge of a wide gully the Boy made a splendid point; the bird was flushed but not shot at. A long draw was then made through a cotton and cornfield, and in a strip of sedge grass the Boy found and pointed a bevy; Bob dropped to the same birds a moment afterward. Merriman shot for Stephenson and missed. Tucker also failed to kill. Bob then pointed a single bird and Merriman again scored a goose egg. Crossing a ditch the Boy pointed again, the bird was flushed but not shot at. Bob then picked up a point. The Boy then pointed on the edge of a ditch. Tucker flushed three birds but did not shoot. The judges then ordered the brace up at 3:30. Down one hour and ten minutes. After consultation they ordered the dogs down again at 3:45. They got off as fresh as larks, and in five minutes Bob had pinned a bevy in the edge of a sorghum patch, the Boy coming up backed him in good style. The birds were flushed and missed by Tucker. Ordered on Bob got a point on a single bird. They were then ordered up and Bob Gates declared winner of the heat. Down last time fifteen minutes; in all one hour and twenty-five minutes. Taking into consideration the age of Bob Gates, who is a Derby entry, this was one of the very finest heats in the history of field trials.

BESSIE A. AND GUS BONDHU.

Bessie A., a lemon and white English setter bitch (Dashing Lion—Armida), handled by Avent, and Gus Bondhu, black and white English setter dog (Dashing Bondhu—Novel), handled by Tucker, were cast off after the previous brace were taken up, at 4 o'clock. They drew a cornfield, a large stubble and some woods blank. They were then put over a wire fence in a meadow and woodland, where Bessie soon found two bevies. Avent flushed and killed, and to order Bessie retrieved nicely. Gus then pointed a single bird and was backed by Bessie in good style. Night coming on they were taken up at 5 o'clock to be put down next day.

Friday it was cloudy with high wind from the southeast, with occasional dashes of rain. The same brace was put down on the Hunt farm, four miles north of town, at 9 o'clock in the edge of a sedge field. The spectators immediately flushed a large bevy, which settled on a hillside in scrub oaks. Going after these Gus flushed the whole lot down wind. They flew into a sedge field where Gus soon scored a point on a bird, followed by another, followed by one for Bessie, who soon dropped on another. Avent flushed, but failed to kill. Then Gus got a point and Tucker missed his bird. Going on in the grass Bessie scored a point, Avent flushed the bird and fired his gun into the air. Going into some bushes, Gus got a point from which Tucker kicked up three birds, but did not shoot. In the edge of some brush Bessie pointed a bird that was flushed, but not shot at. The dogs were then ordered up at 9:25 and Gus Bondhu declared the winner. Down twenty-five minutes. A dash of rain came on at the finish and the crowd took refuge in a cabin.

LADY C. AND SPORTSMAN.

At 9:40 B. M. Stephenson's black, white and tan English setter bitch Lady C. (Coleman's London—Belle of Hatchie), handled by owner, and Major Murnan's black, white and tan English setter dog Sportsman (Gladstone—Sue), handled by Tucker, were cast off in an open field. Both went away at a good pace through the sedge grass. Lady C. soon disappeared and when found was down flat on a point. The birds were flushed and Stephenson failed to kill. They went down on a hillside in the sedge where Sportsman found and pointed a single bird and was backed by Lady. Going on Lady pointed a bird, then Sportsman scored a flush. Going back into a cornfield the dogs got out of sight, and when found both were down on a point. Tucker flushed the bevy, shot and killed, and the bird was retrieved by Sportsman in fine style. The scattered birds went down in the scrub oaks, where Lady picked up two points in quick succession and Sportsman got one. Going out into the sedge Sportsman pointed another bird that was flushed but not shot at. In briers Sportsman drew to a point backed by Lady C. in grand form, but Tucker failed to get up a bird before him. Then Lady made a point in some brush and was backed by Sportsman. Then he scored another point in some weeds and grass. Going on Sportsman pointed a bevy in sedge grass. The birds were flushed but not shot at. They then went down over a wide gully, impassable for horses, and the judges went across on foot. In the sedge Lady pointed a single. Then Sportsman false pointed. Coming back Lady flushed a single bird and dropped to wing; then on the edge of a pond she pointed a single bird and was backed by Sportsman. The bird was flushed but not shot at. Going on in the grass she whirled on a sudden point, her handler flushed and shot the bird, which she retrieved in splendid style. They were then ordered up at 11:10. Down one hour and thirty minutes. After consultation the judges ordered them down again. They got away as before, the bitch going a little faster than the dog. A large bevy was flushed by the judges in a locust thicket and marked down in the sedge grass along the border of a swale. Sent into the grass Lady dropped on a single bird and dropped to wing; Moving on through the brush and weeds Sportsman made a point. The bird was flushed but not shot at. Then Lady, a little further on, dropped to a point, the bird getting up several seconds after she had established her position and was down, flat and motionless. The judges did not allow her this point, but she was certainly entitled to it. The brace was then ordered up and Lady C. declared the winner. Down the last time thirty minutes.

RICHMOND AND GATH'S MARK.

Mr. Macklin's black, white and tan English setter dog Gath's Mark (Gath—Gem) handled by Tucker, and J. E. Gill's lemon and white pointer dog Richmond (Don—Beulah), handled by Short, were cast off in the sedge at 11:55. They got away in fair style, the setter having a little the advantage in speed. In the edge of some high grass Richmond drew to a stylish point, and was handsomely backed by Gath's Mark. Short flushed the bevy and fired both barrels but failed to kill. Both dogs were steady. Ordered on Richmond soon pointed again. Short flushed three birds from before him, two of which he knocked down and Richmond retrieved each bird in good style. Going on into some low, thick grass, Gath's Mark flushed a bird. Then he made an undecided point on a bird that flushed some distance ahead of him. He then, in the edge of some woods, drew to a point, but no birds could be flushed before him, although he alternately drew and pointed all around for five minutes. Going around outside the woods a large bevy was flushed by a spectator. Part of them went into some hog-weeds along a ditch. Here Richmond ran up one, and then Gath's Mark pointed, Tucker flushed, killed and the bird was well retrieved. Going on, Gath's Mark pinned another single which was flushed but not shot at. In the edge of the woods Richmond came on and pointed part of the same bevy. Short shot and missed. Then each dog got a point on single birds. The dogs were then ordered up at 12:50 and Gath's Mark awarded the heat. Down fifty-five minutes. Recess was then taken for lunch.

TRINKET'S BANG AND AMERICAN DAN.

At 1:10 Mr. Titterington's liver and white pointer dog Trinket's Bang (Croxteth—Trinket), handled by Nesbit, and Mr. House's white and tan English setter dog American Dan (Lincoln—Daisy Dean), handled by Short, were put down in a cotton field. Dan was but a shadow of his former self and

seemed hardly able to go. But he was like a singed cat—much better than he looked—and after he got limbered up did some pretty fair work. Trinket's Bang got away at a rattling lick, and in about a minute was clear away on the other side of the cotton field. Then the dogs were swung round into the woods, where Dan soon stiffened on a point, that is, if he could get any stiffer than he already was. Short shot and killed and to order the bird was retrieved in good style. Then Trinket's Bang got a good point in the leaves, but Nesbit failed to get the bird. Ordered on. Dan soon pinned another, which was not shot at. Then Bang whirled to a point. A little beyond Dan pointed. Short shot and killed and Dan again retrieved well. Going down wind, Bang flushed a single bird in the leaves. Then Dan pointed near the same place, the bird was flushed, but not shot at. Passing near a fallen tree, Bang pointed, and Nesbit, after considerable thrashing around, kicked the bird out from under a log. Going on, Dan pointed near a brush fence. Three birds got up, but were not shot at. The woods seemed full of them, for in about ten seconds Dan pointed again. Short flushed, shot and missed. Then Bang pointed. Nesbit shot and killed and the bird was handsomely retrieved. Then each dog scored a point. Going into the open, Dan pointed a hare and was backed by Bang. A bevy flushed by the handlers went down in some low, thick weeds and grass. By this time the wind had increased and was blowing quite hard. Going into the corn, Bang pointed and was backed by Dan in good form. The bird was flushed, but not shot at. Then Dan pointed, but did not locate his bird, which was flushed behind him. He then made a flush, and they were ordered up at 2:20. Down one hour and ten minutes. After consultation the judges decided the heat in favor of Trinket's Bang. Just as the heat was ended the rain commenced falling. After it ceased the next brace was called.

RODERIGO AND DORA.

At 3 o'clock the Memphis and Avent Kennels' black, white and tan English setter dog Roderigo (Count Noble—Twin Maud), handled by Avent, and Mr. O'Riley's red Irish setter bitch Dora (Box—Rowena) handled by Von Donhoff, were cast off in a cornfield. Roderigo went away at a terrible pace, far out-speeding any dog previously down. He has splendid style, both in action and on his points. The little bitch, though no slouch herself, was simply nowhere. In some sedge grass under a fallen treetop Roderigo drew to a grand point and was backed by the bitch in good form. Here Avent flushed a big bevy and at the same time a hare, which Roderigo wanted. On a hill beyond he pointed a single bird, but was not steady under the gun. Then he made a false point and was backed by the bitch. Crossing a lane into another field he made a splendid point, standing in the bottom of a gully, the wind blowing a gale. The bevy flushed wild and were not shot at. Going on up the hill he pointed another bevy in the sedge grass. Then he got in a point on a single bird. A little further on he drew on and pointed a part of a bevy. The brace was then ordered up at 4 o'clock. Down one hour. Roderigo wins the heat. This ended the first series with the following result:

First Series.

Baden Baden beat Mainspring.
Belle of Piedmont beat Lillian.
Juno A. beat Count Nutt.
Rebel Wind'em beat Queen Bess.
Bob Gates beat Gladstone's Boy.
Gus Bondhu beat Bessie A.
Lady C. beat Sportsman.
Gath's Mark beat Richmond.
Trinket's Bang beat American Dan.
Roderigo beat Dora.

Second Series.

BADEN BADEN AND BELLE OF PIEDMONT.

Baden Baden and Belle of Piedmont were cast off in the sedge grass where the last brace were taken up at 4:05. The bitch got away in good style and had the heels of the dog; she soon made a point in the grass but the bird got up wild and was not shot at. In about two seconds she pinned another, which was snapped at by her handler. Going on she dropped on another point, and was backed in good form by Baden. McMurdo flushed and killed, and to order she retrieved the bird in splendid style. Going out of sight over the hill she was found on a staunch point near a gin house, with her nose almost on the bird, with Baden backing; the bird was killed and retrieved. It was wonderful how she pointed it down wind in such a gale. Going down into some thick sedge grass she whirled to another point on a bird. McMurdo's gun failed to fire. They then drew the side of the hill and Baden located a bird after the bitch had first got the wind of it. Then over the hill they were found on point, facing each other, and the birds were flushed behind them. They were then ordered up at 5 o'clock, to go down again next day. Down one hour.

Wednesday it was cold with the wind from the west. The same brace was sent away at 8:40 in a field. Belle soon pointed in some woods a large bevy, Baden backing. Baden then ran into some scattered birds and stopped. They got up on all sides. Going into grass he roaded a bird to a point, then in a cotton field both ran past a bevy which flushed wild, then in some oak woods Baden pointed and Belle backed. Ellison flushed but did not shoot. Then Baden got in another point. Going on both pointed and the birds flushed behind them. Then Belle dropped on a point. McMurdo flushed but did not shoot. Going on each dog got a separate point. McMurdo flushed the bird before Belle. She was steady to wing. Then Baden pointed and the bird flushed wild. Then Belle got a point, the bird was flushed and killed, and to order was well retrieved. Going on each backed the other. Ordered on Baden pointed a hare and was backed by Belle, both were steady to fur. Further on Baden pointed a bevy, they were flushed but not shot at. Both dropped to wing. Then ordered up at 10:15 and the heat awarded to Baden Baden. Down one hour and twenty-five minutes.

BOB GATES AND JUNO A.

Bob Gates and Juno A. were cast off in grass at 10:20. They got away in good style, Bob the faster of the two. Juno soon pointed in some woods, but the birds flushed wild. Going on she ran up a brace in the grass. She then pointed and was backed by Bob. The bird was killed and retrieved by Juno. Then each got a separate point on single birds. Going into some grass Juno flushed a bird. Then Bob pointed and Juno backed, but Stephenson failed to get up a bird. Then in a thicket he false pointed. Going on he scored a point and was backed by Juno. Stephenson failed to kill. Both steady to gun and wing. Following the birds Juno pointed and then flushed, and Bob picked up three points in quick succession. They were then ordered up at 11 o'clock and Bob Gates awarded the heat. Down forty minutes.

REBEL WIND'EM AND GUS BONDHU.

At 11:20 Rebel Wind'em and Gus Bondhu were sent off in a cornfield. In a thicket beyond Gus flushed and stopped. Wind'em coming up ran into the rest. Then Wind'em pointed a hare and Gus backed. In a thicket Gus pointed a bird that was flushed and missed. Gus then false pointed three times. Then in grass he flushed a bird, and near by Wind'em false pointed and was backed by Gus. At the edge of some grass he false pointed again. Near the woods the spectators flushed a bevy while Wind'em was drawing on them. In some woods Gus pointed a single bird and then a bevy. Tucker killed and to order Gus retrieved. Then in a thicket Wind'em flushed, and near by Gus pointed and was backed by the other dog. The bird was killed and retrieved by Gus. Then each dog made a false point in succession and was backed by the other. They were then taken up at 12:25 and Gus Bondhu awarded the heat. Down one hour.

LADY C. AND GATH'S MARK.

Lady C. and Gath's Mark were put down in a cotton field at 12:30. At the edge of some woods Lady pointed and Mark backed. The birds were flushed but not shot at. They flew to the woods, where Lady pointed and was backed by Mark. Going on she pointed again. The bird was killed and retrieved well by Lady. Then Mark wheeled to a fine point. The bird was flushed but not shot at. In the open Mark pointed false and Lady backed. Then in the woods Mark pointed. The bird was flushed and shot, and well retrieved by Mark. Lady then false pointed and was backed by Mark. Casting toward the open the judges flushed two birds. Then Mark false pointed and Lady backed him. Going on she ran up a bird and dropped to wing. Near the edge of the woods Lady made game. Mark coming up, both ran into the brush and were found pointing; the bevy had flushed near by. Then on a hill Lady flushed and dropped to wing. She then pointed, but Stephenson failed to get up a bird before her. They were taken up for lunch at 1:40. After lunch they were cast off in a cotton field. They went into some woods, where Lady made a long point on a bevy. The birds were flushed but not shot at. Going on, Lady false pointed and was backed by Mark. Then in some grass Mark made two false points. Further on Lady C. was found dropped where a bevy had got up, but it could not be told whether she had flushed or not. Going on each got a point. Then a bevy flushed wild as both dogs were drawing on them. Then across a hollow each dropped to points. Both moved on and Mark cast from his point, and Lady, coming up, pointed, but the birds flushed wild. Following them Lady pointed, when they again flushed wild. Then near a ditch both pointed, Lady on back trail. She cast off and pointed again. The birds were flushed but not shot at. Mark moved up and pointed again, but the birds flushed wild and he dropped to wing. They were then ordered up at 3 o'clock and Gath's Mark awarded the heat. Down two hours and thirty minutes.

RODERIGO AND TRINKET'S BANG.

At 3:10 Roderigo and Trinket's Bang were cast off in a cotton field. They got away at a gait which put everything on a run, and in about ten seconds Roderigo was out of sight. When seen again he was drawing on a bevy, which he located and held his point until Avent got up. The birds were flushed, one killed and well retrieved. But the point was not allowed, as the other dog was taken up while Roderigo was looked up. Going into corn he pointed another bevy. The birds were flushed but not shot at. They flew into some woods. Following them in the dogs picked up point after point in quick succession, Trinket's Bang scoring five points and Roderigo four. Nesbit killed one bird over Bang, which was well retrieved. Going into the open both dogs got a point on single birds. Then Roderigo picked up two points in quick succession. The birds were not shot at. They were then ordered up at 3:50 and the heat awarded to Roderigo. Down forty minutes. This finished the second series. Following is the result:

Second Series.

Baden Baden beat Belle of Piedmont.
Bob Gates beat Juno A.
Gus Bondhu beat Rebel Wind 'em.
Gath's Mark beat Lady C.
Roderigo beat Trinket's Bang.

Third Series.

BOB GATES AND BADEN BADEN

were put down at 3:55 in the grass field where the other brace was taken up. Baden Baden soon pointed and Bob backed. Ellison flushed and killed and to order Baden retrieved well. Both dogs were a little unsteady to gun. Then in some woods Bob pointed a single bird which flushed wild. Baden then pointed on a back trail and was backed by Bob. Then Baden cast off and Bob flushed the bird. Moving on Baden false pointed. Further on Bob made a grand point on a bevy. Stephenson shot and missed. Then Bob pointed a single bird. Going on a few feet Baden pointed a bevy, and soon after Bob ran up a single bird. He then pointed and was backed by Baden. Going into some rag weeds Baden pointed and then moved on up wind and flushed a bevy. Going on the dogs both pointed from opposite sides of a brier thicket. The birds flushed wild and the point was given to Baden. Following them Baden pointed, then cast off and flushed. Going into some woods Bob stopped on a false point. Further on Baden false pointed and was backed by Bob. They were then taken up at 5 o'clock and Bob Gates declared winner of the heat. Down one hour and five minutes.

RODERIGO AND GUS BONDHU.

Thursday was cold with occasional clouds in the morning; the afternoon was clear. Roderigo and Gus Bondhu were put down near some woods at 9:05. They got off at a good pace, Roderigo the faster. Following a bevy flushed by spectators into some corn, Roderigo got the first point on a bird and Gus backed. Avent shot and winged the bird and Roderigo retrieved it well. Cast into a thicket, he again pointed a bird that was flushed, but not shot at. Then Roderigo was lost sight of and when viewed was pointing a rabbit. Beyond a thicket Gus pointed a bevy and Roderigo backed him. Tucker flushed, shot twice and killed a bird which was not retrieved. The birds were followed and Roderigo lost sight of again and when found was pointing in an oak thicket. Avent failed to flush a bird in front of him. Then in the edge of a cornfield he pointed again. Moved on, roaded a short distance and pointed and a bevy was flushed, but not shot at. Following them over a hill he pointed, then moved on and flushed the bird. Gus coming up pointed a bird that was flushed but not shot at. Roderigo pointed and then Gus got a point. Tucker flushed and shot twice, but failed to kill. Going into a woods after birds flushed by the judges, Roderigo false pointed. He then pointed a bird in a brush pile. Moving on he pointed again and was backed by Gus. They were then ordered up at 10 o'clock and the heat awarded to Roderigo. Down fifty-five minutes. This finished the third series with the following result:

Bob Gates beat Baden Baden.
Roderigo beat Gus Bondhu.
Gath's Mark a bye.

Fourth Series.

BOB GATES AND GATH'S MARK.

This brace was sent away in the open at 10:15. They both showed good style and speed. Going beyond a hill, Bob flushed a rabbit and both dogs dropped to order. Bob then pointed and Mark backed. Moving on, he located the birds and Mark backed again. Stephenson flushed the bevy and killed two birds with one barrel. Bob retrieved them both in good style. Further up the hill he pointed a bevy which flushed wild. Swinging down the hill, each dog pointed at the same time on single birds. Then in some woods Mark false pointed. He then flushed a single bird. Bob then pointed and Mark flushed. Then in quick succession each dog picked up three points. Moving on Mark pointed again. The bird was killed and to order well retrieved. Going on Mark made another point. Then Bob false pointed, just to break the monotony of the thing. He then pointed twice again. Pointed, moved on and false pointed. Gath's Mark then pointed a hare and was steady to fur. He followed with two false points, and Bob got in a point on a single bird. Going on, Mark stiffened again on a hare. Then Bob pointed a single bird and Mark false pointed. Bob then pointed where a bird had just been flushed. Running down wind he then flushed a bird. Then Mark flushed and dropped to wing. They were then ordered up at 1:45. Bob Gates declared winner. Down one hour and thirty minutes. This ended the fourth series. Following is the result:

Fourth Series.

Bob Gates beat Gath's Mark.
Roderigo a bye.

Final Tie for First Place.

BOB GATES AND RODERIGO.

This was the final heat for first place. After giving Bob Gates twenty minutes rest he and Roderigo were cast off in sedge grass. Both went well, Roderigo being the faster and ranging wider. Roderigo made a magnificent false point in the road, curled up like a capital C. Going on he pointed a hare. Then in a thicket Bob, not to be outdone, stiffened also on a bunny. He then pointed a bevy. They ran, and he did some fine roading and located them in elegant style. Stephenson killed and the bird was well retrieved. Roderigo then flushed a bevy, which flew into sedge grass. Following them Bob flushed and then got a point on a single bird. Roderigo flushed a bird, and soon after pointed. Bob got a point at the same time. They were then ordered up for lunch at 1:05, and cast off again at 1:45. Both soon pointed. Bob was a little unsteady to wing and gun. A bird was killed, and to order he retrieved well. He then flushed, and a moment after pointed a single bird. Roderigo pointed, and going on flushed and dropped to wing. Both then false pointed, and further on pointed where a bevy had just been flushed. Taken into sedge grass after the scattered birds, Roderigo pointed and Bob backed. Moving on both pointed. The birds were flushed but not shot at. Roderigo then got another point, and the brace was ordered up at 2:20, and Roderigo declared winner of the heat and first place.

Ties for Second Place.

TRINKET'S BANG AND GUS BONDHU

were then put down to see which should run against Bob Gates for second place. They were cast off in a cornfield at 2:30. In speed and style they were pretty evenly matched. Gus soon scored a point and was backed in good style by Bang. Tucker flushed the bevy and failed to kill. Going into some woods Gus pointed. The bird was killed and retrieved well. Going on Gus pointed again and was backed by Bang. The bird was flushed but not shot at. Both were steady to wing. Casting off through grass Gus flushed and then false pointed. Moving on he pointed a single bird and then false pointed. Bang followed suit on false point and flush. He then made a fine and stylish point. Gus then pointed where a bird had been flushed. He then pointed a single bird. Bang then pointed a bevy. Following them Gus pointed a single bird that Nesbit flushed, shot and killed, and Bang, after some seeking, retrieved well. The dogs were then ordered up at 3:05 and the heat decided in favor of Gus Bondhu.

Final Tie for Second Place.

BOB GATES AND GUS BONDHU.

This brace was put down to run for second place. They swung around the side of the hill where the last brace ran and Bob soon pointed, but was urged on by his handler, and the judges coming up flushed birds near where he had pointed. Out from the woods in thick weeds Gus pointed a stink bird. Then in weeds Bob pointed. Stephenson shot and missed. Both dogs were steady to shot and wing. Going on Bob ran up a single bird and then pointed. The bird was flushed but not shot at. He then flushed a bird, and soon after in grass he pointed footscent and then moved on and roaded to a point. Stephenson shot and missed, Bob steady to wing and gun. He then false pointed. Gus near a ditch in some grass pointed a single bird and was backed by Bob in grand form. Tucker shot and killed and to order Gus retrieved in good style. Going along the ditch Bob pointed. Stephenson flushed, shot and killed and Bob retrieved well. Gus then pointed. The bird was flushed but not shot at. Further on the handlers flushed five birds which flew into the woods. Following them Bob pointed a bird that was flushed but not shot at. Gus then false pointed. Working west Gus pointed in a plum thicket and was backed by Bob. The birds were flushed but not shot at. Bob then pointed. Going on Gus picked up two points in quick succession followed by a false point. Bob then ran up a bird and soon after pointed. Stephenson flushed the bird and Bob was a little unsteady. Gus then pointed and the bird was flushed but not shot at. Going on both dogs ran into a bevy. Then they flushed a bird between them. In sedge grass each dog got a point. Then Gus flushed a bird, and soon after pointed. They were then ordered up at 4:30, and Gus Bondhu was awarded the heat and declared winner of second place.

Final Tie for Third Prize.

BOB GATES AND TRINKET'S BANG.

This brace was called up to run for third place, but they agreed to divide, and the All-Aged Stake was finished.

Following is a complete

SUMMARY.

First Series.

Baden Baden beat Mainspring.
Belle of Piedmont beat Lillian.
Juno A. beat Count Nutt.
Rebel Wind'em beat Queen Bess.
Bob Gates beat Gladstone's Boy.
Gus Bondhu beat Bessie A.
Lady C. beat Sportsman.
Gath's Mark beat Richmond.
Trinket's Bang beat American Dan.
Roderigo beat Dora.

Second Series.

Baden Baden beat Belle of Piedmont.
Bob Gates beat Juno A.
Gus Bondhu beat Rebel Wind'em.
Gath's Mark beat Lady C.
Roderigo beat Trinket's Bang.

Third Series.

Bob Gates beat Baden Baden.
Roderigo beat Gus Bondhu.
Gath's Mark a bye.

Fourth Series.

Bob Gates beat Gath's Mark.
Roderigo a bye.

Final Tie for First Place.

Roderigo beat Bob Gates and won first place.

Ties for Second Place.

Gus Bondhu beat Trinket's Bang.

Final Tie for Second Place.

Gus Bondhu beat Bob Gates and won second place.

Final Tie for Third Place.

Bob Gates and Trinket's Bang divide third prize.

GRAND JUNCTION, Tenn., Dec. 7.

THE DERBY.

[*Special Dispatch to Forest and Stream.*]

GRAND JUNCTION, Tenn., Dec. 15.

The Derby was finished to-day at sunset. There was a lot of very good work done, many of the heats being hotly contested. Twenty-three of the eighty nominations filled their entries. They were drawn and run as follows:

First Series.

SAM STERRETT (S. S. McCuen)—Black, white and tan English setter dog, April 26 (Gladstone—Lavalette)

beat

JOE NOBLE (Memphis and Avent Kennels)—Black, white and tan English setter dog, Feb. 27 (Count Noble—Countess A.).

KING SHOT (Chas. Whealen)—Liver and white pointer dog, July 24 (Meteor—Diana)

beat

PEGJIM (N. Rowe)—Blue belton English setter dog, May 2 (Cambridge—Marchioness Peg).

NORTIER (W. B. Gates)—Black, white and tan English setter dog, June 14 (Paul Gladstone—Bo-Peep)
beat
GATHLIT (J. S. Hudson)—Black, white and tan English setter dog, June 20 (Gath—Lit).

GATH'S HOPE (R. M. Dudley)—Lemon and white English dog, May 23 (Gat — em)
beat
MAUD D. (Dr. K. D. Davis)—Black, white and tan English setter bitch, Jan. 1 (Lightning—Dora Royal).

BOB GATES (B. M. Stephenson)—Black, white and tan English setter dog, April 22 (Count Rapier—Belle of Hatchie)
beat
CANADA PEG (Memphis and Avent Kennels)—Black, white and tan English setter bitch, May 2 (Cambridge—Marchioness Peg).

PEGFLY (N. Rowe)—Black, white and tan English setter dog, May 2 (Cambridge—Marchioness Peg)
beat
LOGAN (J. M. Avent)—Orange and white English setter dog, June (Lightning—Kate).

NANNIE S. (Dr. G. G. Ware)—Black and white English setter bitch, April 13 (Dashing Berwyn—Juno A.),
beat
BON SELENE (J. W. Renfroe)—Black, white and tan English tter bitch, Jan. 1 (Lightning—Dora Royal).

BEAUTY GLADSTONE (L. S. Colyar)—White, black and tan g.ish setter bitch, Aug. 21 (Gladstone's Boy—Dora Royal),
beat
TARQUIN (W. B. Gates)—Black, white and tan English setter dog, June 14 (Paul Gladstone—Bo-Peep).

NOBLE C. (W. J. Cannon)—Black, white and tan English setter dog, April 22 (Count Rapier—Belle of Hatchie),
beat
PAP SMIZER (Gus Sander)—Liver and white pointer dog, July 24 (Meteor—Diana).

CARLOTTA (W. H. Parsons)—Black, white and tan English setter bitch, Jan. 1 (Lightning—Dora Royal),
beat
PEGBID (N. Rowe)—Blue belton English setter dog, May 2 (Cambridge—Marchioness Peg).

JACKSON (J. A. Ellison)—Orange and white English setter dog, May (Baden Baden— ——),
beat
MAGGIE GLADSTONE (A. P. Gillian)—Black, white and tan English setter bitch, April 26 (Gladstone—Lavalette).

GATH'S MARK (J. N. Maclin)—Black, white and tan English setter dog, May 23 (Gath—Gem) *a bye.*

Second Series.

Gath's Mark beat Nortier.
Gath's Hope beat Sam Sterrett.
Bob Gates beat Pegfly.
Nannie S. beat Beauty Gladstone.
Noble C. beat Carlotta.
Jackson a bye.

Third Series.

Gath's Mark beat Jackson.
Gath's Hope beat Bob Gates.
Nannie S. beat Noble C.

Fourth Series.

Gath's Hope beat Gath's Mark.
Nannie S. a bye.

Final Tie for First.

Gath's Hope beat Nannie S. and won first prize.

Ties for Second Place.

Bob Gates beat Gath's Mark.

Final Tie for Second Place.

Bob Gates beat Nannie S. and won second prize.

Ties for Third Place.

Nannie S., Gath's Mark and Canada Peg divided third prize equally.

THE POINTER BITCH FANCY.— Stanton, Mich., Dec. 7. *Editor Forest and Stream:* As there has been some controversy lately in your columns regarding the pointer bitch Fancy, whose pedigree is a disputed question, I would like to make a little explanation. About the middle of last August I bought the bitch above referred to of Mr. C. E. Lewis, Suspension Bridge N. Y. (now of Collingwood Ont.) and received of him a pedigree stating that she was by Croxteth out of Royal Fan, but there was no date of birth given, and being very particular about everything connected with the pedigree of my dogs I commenced a correspondence with several parties to find out what I could about the bitch. Among the parties written to was Mr. Dilley, of Rosendale, Wis., whom I knew to be the owner of Royal Fan. Mr. Dilley replied saying the pedigree was fraudulent. I at once notified Mr. Lewis of what Mr. Dilley had said, and he seemed very much surprised and said if he could not establish the pedigree as given he would make good my loss. Having failed to make the pedigree satisfactoy Mr. Lewis has made satisfactory settlement with me, and in view of all that has been said in regard to the matter I think it is due Mr. Lewis to say that throughout the whole transaction he has treated me honorably and fairly, and as one sportsman should treat another. In conclusion I should say that all the parties concerned are strangers to me, and only my desire to see justice done prompts me to make this explanation.—W. J. PERCIVAL.

A FOX-TERRIER SHOW.—*Editor Forest and Stream:* The American Fox-Terrier Club is negotiating with the poultry show people to effect arrangements for a fox-terrier show on Feb. 4, 5 and 6. It will be the first specialty show in this country. The proposed prize list is very liberal, and fifty terriers have been promised by members.—K.

THE BLACKSTONE KENNELS.—Mr. Fred E. Lewis, of Tarrytown, N. Y., has joined Messrs. C. Fred Crawford and W. Tallman as a member of the Blackstone Kennels. The kennels will remain under the supervision of Mr. Tallman, who has removed with the dogs to Tarrytown.

THE NEW ENGLAND KENNEL CLUB.—*Editor Forest and Stream:* At a meeting of the New England Kennnel Club, held at their rooms Dec. 10, Mr. Edward A. Moseley was elected secretary, vice Mr. Jean Grosvenor, resigned.—EDWARD A. MOSELEY.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

A SUBSCRIBER, Atlantic City.—A setter of late has got very thin and is continually slobbering at the mouth. I give him plenty of food (mush and meat boiled together) and t keep him chained, but he does not get any fat upon him. I have been giving him sulphur but it does not seem to do him any good. Ans. Give five drops tincture belladonna, night and morning, and a two grain pill of the citrate of iron and strychnine three times daily nidden in a bit of meat. Keep his bowels in order. Report to us if you see no improvement under the treatment.

A. J. L., Southington, Conn.—My pup has broke out under his fore leg and a little under his belly. Ans. Have ointment made as follows: Sulphate of morphine 2 grains, powdered camphor 20 grains, balsam of Peru ½ ounce and zinc oxide ointment 2 ounces. Mix and apply not too freely night and morning.

Rifle and Trap Shooting.

RANGE AND GALLERY.

BOSTON, Dec. 12.—There was a fair attendance of riflemen at Walnut Hill to-day. The bad weather conditions made shooting difficult, and only a few scores were completed. On Wednesday next the range will be open for trap shooters. The association has opened a special military match. Following are the scores of the day:

Decimal Match.

W Charles	5	10	10	8	10	10	9	5	8	9—84
A C Adams	10	7	7	6	8	9	6	10	6	9—78
W H Oler	8	8	7	8	7	5	10	8	7	8—76
B G Warren	8	5	9	10	7	8	7	4	9	5—70
H Withington	3	5	6	5	7	3	8	4	5	8—54

Decimal Match Practice.

J Francis	9	10	10	5	6	10	4	10	9	8—81
J Duffer	7	7	6	10	9	6	10	3	9	4—76
J Missane	6	5	8	6	4	6	7	8	10	10—70
John Sharp (mil)	5	7	9	3	9	7	3	9	3	7—62
J Harris	7	10	8	1	8	9	8	5	2	2—60

Rest Match.

D L Chase	10	10	10	10	10	10	10	9	10	10—99
S Wilder	8	9	10	9	10	9	8	10	10	10—93
S Winchester	9	10	9	9	10	10	8	10	7	10—92
Roberts	10	10	6	9	8	10	10	10	10	9—91

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

NYPANO RULES.—The quarterly meeting of the Nypano Union Shooting Club will be held at Falconer Crossing, 2 miles below Jamestown, N. Y., on Jan. 12, 13 and 14. Distance 40 rods, string measure. Parties using guns over 30lbs. as fired, will have added to their strings 1-10 of an inch for each pound. Parties using guns under 30lbs. will have deducted from the length of their strings 1-10 of an inch for each pound. Parties using any kind of rest that can be used successfully without holding the gun to their shoulder will have added to the length of their strings 10 per cent. Parties shooting from the shoulder shall have no attachment or device to prevent the free recoil of the gun to their shoulder. Parties using no stops or guide in front and nothing under the breech of their guns except their hands will be entitled to 10 per cent. deduction on the length of their strings. No contestant will be allowed to place in the field more than three flags, dodgers or streamers of any kind. All strings to be fired at two targets to be placed on the battery at the same time five shots at each target. Trial targets will be furnished also business targets if desired. After time is called parties will be allowed sixty minutes to fire their string of 10 shots. Targets, after being shot at are not to be handled by the contestants until after they are measured. In addition to all handicap and per cent. of heft of guns and mode of resting, 5 per cent. deduction will be made on the length of all strings made with breechloading guns. R. C. Rice, Warren, O.; H. F. Hart, Rochester, N. Y.; H. V. Perry, Jamestown, N. Y., committee

WELLINGTON, Mass., Dec. 12.—The range of the Wellington Gun Club was thronged with lovers of the shot gun to-day, including a large number of students from Harvard. The various events resulted as follows: 1. Five blackbirds—Wardwell and Pond divided first. 2. Five pigeons—Curtis first. 3. Five blackbirds—Palmer and Shumway divided first. 4. Five pigeons—Palmer and Eddy divided first. 5. Five blackbirds—Stanton, Sanborn and Wardwell first. 6. Medal match—Swift took first medal with 9, Shumway second with 8, Pond third with 7. 7. Ten pigeons—Swift first. 8. Five blackbirds—Stanton and Shumway first. 9. Five blackbirds—Wardwell first. 10. Five blackbirds—Curtis and Pond first. 11. Five blackbirds—Shumway, Shaefer and Wardwell first. 12 Five pigeons—Snow first. At the shoot on the 17th inst. the Brockton and Wellington clubs will contest for the State glass ball badge.

ALGONQUIN GUN CLUB.—New York, Dec. 11, 1885.—Annual meeting of the club held Dec. 6, the officers elected for the following year were as follows: Robert Gordon, President; Joseph Hanna, Vice-President; Isaac Mayer, Secretary; Bennet Greig, Treasurer; Joseph Marcey, Corresponding Secretary. James Dunseith, B. Greig, J. Hanna, H. Griswold and J. Mayer were elected Trustees for 1886. The club roll has fifty-four active members, and the Treasurer's report very satisfactory. Glass-ball and clay-pigeon shoots will take place every Thursday on the club grounds at Weehawken, and several friendly matches with neighboring clubs are anticipated. The Algonquins are always glad to have their shooting friends visit them on meeting days. Boat leaves Weehawken ferry, foot of Forty-second street, at 12 o'clock M. and every forty minutes thereafter.—I. E. M. L.

STAUNTON, VA., GUN CLUB, Friday, Dec. 4.—In a match at 15 bats and 10 composition balls, the following score was made, 25 balls and bats: Ayres 22, Brown 20, Crouder 16, Cushing 13, Cochran 16, Cooke 21, Jones 13, McGuffin 13, Jamison 15, Wilson 12, Summersen 24, Whittle 20, Wayman 21, Bumgardner 20. Summersen won first prize, Ayres second, Wayman third, Cook fourth, Bumgarner fifth.—JACK.

JERSEY CITY.—The Jersey City Heights Gun Club have elected the following officers: Dr. A. H. Yerrington, President; A. Heritage, Secretary and Treasurer; Geo. B. Eaton and Wm. Hughes, Executive Committee.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

Yachting.

CRUISE OF THE COOT.

IV.

IN round numbers the cabin, outfit and a sail, purchased for $12, together with the new skiff mentioned, represented a total outlay of $150. Besides, a small bill of stores was laid in. It is always preferable to live off the fat of the land as you go along and not draw upon canned provisions any more than necessity requires. Fresh supplies are more nourishing and palatable, as well as only half as expensive. A stock of staples should, however, be kept on hand to bridge over intervals when nothing can be had from shore. Tastes differ as to what is essential. In the way of meat, smoked beef of a mild cure goes a long way. Bacon or a ham will also help out. A few cans of vegetables, first among them Boston baked beans, a box of pilot bread or hard tack, cheese, butter, sardines, mackerel, eggs, marmalade, figs and syrup, with spices, vinegar and coffee, comprise all that is wanted to live a week without communication with the land, and live like a fighting cock, too. For it must be remembered that the single hand sailor has to attend his boat all day in the open air and develop an appetite perfectly shocking to a landsman's ideas of propriety. Now, appetite is the best sauce in the world, and washes down the rudest elements of a meal with more gusto than a *menu* of dainties and intricate French problems set before the diner and winer on shore. The "high liver" knows not what good living is alongside the boat-sailer who brings an honest appetite to bear upon his gastronomic endeavors. Time and again have I munched a pocketful of hard tack with a relish not surpassed while partaking of the most elaborate banquet in many courses which artists in that line could devise to tickle a palate dulled by a succession of good things and nothing to incite it afresh.

The beginner invariably fits himself out with all manner of trash. Some would even take along paté de foi gras and ice cream. The old hand has long ago learned to shift with the primaries of nourishment, even to the exclusion of sugar, milk and butter. Yet with an appetite he enjoys what he has and thrives thereon all the better, for he has less trouble staring him in the face to keep his larder full, to prepare his meals, and then—to wash up! Thoroughly cooked food, and, above all, regularity, are the essentials to health. I believe the medical fraternity will sustain me in this. A meal partaken with a fierce appetite is worth a score languidly swallowed merely in routine. In full knowledge whereof I speak, let me counsel the very plainest of living, and the best ends of yacht cruising will be brought about. Health and vigor follow in natural sequence. They come without being sought. Nerves are quieted to a delightfully even tone and sleeplessness vanishes before the balm and soothing tonic of the salty air of the sea.

Yachting is still misunderstood by the great public, and not yet appreciated at its worth by the profession. If Esculapius of old could have indulged in a three-months' cruise afloat he would have handed down to his later disciples a mandate which would have superseded drugs and concoctions and brought relief in nervous affections and disorders springing from the digestive organs, such as no school of medicine has yet succeeded in offering to suffering humanity. Enervation and even lack of mental balance cannot long resist the assuaging ecstasy borne with the inspiration of bright, pure breezes richly laden with ozone, and merry, sparkling waters flashing into diadems of glistening white. Nor is nature in her more turbulent moods without a full meed of compensation to the patient pursuing health from close relationship with the mother from which physical well-being takes its source, without the intervention of stimulating artifice or professional formulæ occasionally akin to high class voodooism. After a rough day's contest with tumbling seas and gales whistling through the rigging, the yachting cure brings to bear the peace of a calm harbor manfully earned, and the sweets of honest slumber follow upon the harassed mind and tired limbs to restore capital to both next morn, compounding interest on spirit and muscular brawn to boot.

But it will be objected, the yachting cure is expensive.

To this I demur. In the words of the Germantown *Telegraph:* "There is yachting and yachting." And, so too, it is or it is not expensive. There is the large and costly vessel requiring a mint of money to run for a short season. With numerous crew and cumbersome to maneuver, she is got underway at great intervals and the owner dwindles away into little more than a passenger off for a few hours' outing. His interest is but passing. The burden is heavy. The yacht is a magnificent example of all that is grand and "palatial." But she fails to afford sufficient return upon the outlay and becomes simply an appendage to an "establishment," demanded by the competition of fashionable society. Such a yacht, such yachting, is costly in the extreme. And the owner tires of her quickly, sacrificing her for a song to unload a white elephant upon the next unfortunate about to plunge into similar experience. Spot there is little in vessels of size. Their yachting is but a fringe to the picture. *Real* yachting, if a hackneyed expression be allowed, must be sought for in small boats with gratifying results many times as great, at a tithe of the expense. Such yachting is not a costly amusement. It is a pastime if you wish. But it is manly, instructive, and highly beneficial in every respect. It is cheap. It is cheaper than staying at home. A few hundred as capital invested will furnish boat and appliances for ten years or more with trifling renovations. For less than you save in shore clothing alone you can house yourself in excellent floating quarters more suitable to the purposes of "real" yachting than a fortune spent upon a gilded monster of unwieldy proportions. In your small boat you can see much of the world, as I propose doing in the Coot. Living becomes so ridiculously cheap that your wash bill on shore will suffice to cover the account.

Here is the way we got along aboard the good ship Coot, and here is the balance sheet of expenses:

BREAKFAST AND DINNER

Meat, ½lb.—beefsteak, chops, sausage, etc	7c.
Potatoes—fried, baked, boiled	2c.
Onions, tomatoes, beets or stewed fruit	1½c.
Bread, one-fifth loaf, or rolls	2c.
Butter or syrup	½c.
Coffee, tea or cocoa	1c.
Mustard, pickles, spices	2c.
	16c.

One meal for 16 cents, or two for 32 cents, and 8 cents for crackers and cheese or other substitute for cold lunch, and we have a total expenditure of 40 cents per day, with a fearful appetite thrown in for nothing. But the provender has to be cooked. The oil stove of three 5in. wicks, cabin light, riding light, and heating cabin throughout the day and night, all consumed about 7 cents of astral oil per twenty-four hours. Add to this 3 cents for a weakness for the weed, to which the crew of the Coot regrets to state his partiality, and we have for board, lodging and the post-prandial coffee a sum total of just 50 cents per day, or $3.50 per week, or say $15 per month or $90 for six months. Such is the extravagance of yachting! What say you now? Is it expensive?

It is cheaper than staying at home!

The foregoing estimate is based upon supplies from shore. If you subsist on canned goods, the showing will not be as economical.

Life aboard the Coot soon crystallized into definite shape, though devoid of anything approaching to dull routine. No regulations of any sort were permitted to direct the tide of events. The Coot and her crew drifted along with the current, and sought not to buck against the easiest and most natural course of affairs. The angularity of shore customs was rubbed away smooth through force of surrounding conditions, until day and night revolved in even tenor with the least possible friction. Were I to detail the rapid emancipation from the ornate and superfluous elaborations of 'longshore civilization to the fundamental needs of existence afloat, I fear many would hold up their hands in horror at the primitive modes which ruled on the Coot. Yet circumstances alter cases. That which might be allied to barbarism with the exigencies and conveniences of urban culture in reach, becomes simplicity and worthy economy in time, and toilsome fuss away from contact with fashion. Freed from the vanities of keeping up an appearance, and weighing all niceties in costume, toilet and culinary service by the amount of work entailed, the lone cruiser speedily discards many superfluous complexities, and turns from the glittering polish and restraints of the ornamental side of life to its ruder but more tolerant face with a profound feeling of relief.

During the earlier days of the cruise, a bright looking-glass hung in a corner of the cabin. By its aid the Coot's crew would conscientiously part his hair in the middle every morn, particularly concerned about getting the part in the middle. Gradually the glass became obscured. The Coot's crew first reduced accuracy to a guess, and then became more or less indifferent as to whether the hair was parted in the middle or parted at all. After knocking about awhile, capillary adornments were allowed to take shape *au naturel.* Thenceforth the looking-glass was out of occupation. Similarly, all manner of preparations were gone through before turning in at night; as the weather grew colder, one garment after the other was, however, retained, till the crew discovered himself habitually turning in "all standing"! At first blankets were piously stretched out and tucked in, and various coats laid on with mathematical precision. All of this gave way in due course of events, as the useless fuss of an old maid ashore. The process of turning in was reduced to first principles. You felt drowsy, you blinked, you kicked off your shoes or slippers and fell over into the bunk in a heap, you pulled faintly at the bundle of blankets and clothing lying in a promiscuous pile, and that was all you knew till daylight streamed in at the windows. Simplicity itself, effective and all that a cruiser in good health need bother about. "But surely you slept in sheets and pillow-cases?" Nothing of the sort. They would have been a nuisance. Mattress and pillows were covered with light colored drilling. When it got dirty, once in a great while, the covers were sent ashore for a hasty washing. Turning out had like advantages. Yawn, turn over for a nap. Yawn again, sit up and look out the window to assure yourself of the boat's position, as you had promised yourself to do a dozen times through the night, but which sound sleep prevented. Poke legs over the center-board trunk and fish with your toes for the slippers. When they are hooked you are dressed and ready for breakfast. Contrast this plan, neat, speedy, and complete, with all the exasperating toil of building up in tiers from undershirt to frock coat, with cast iron bosoms, tin collars, sheet metal cuffs, narrow beam shoes, and skintight gloves, brain crushers, and tons of overcoats to choke and crush the life within.

"And how about washing?" Washing? Oh, yes, I have forgotten! It has been so long since—but you can wash if you want to. There are oceans of it all around you. Dip up a bucket full and fool away time to your heart's content. I used to do it. Now that I have grown more experienced—but I fear to reveal the truth, it might be too shocking. "Nessmuk" in his chatty little volume, "Woodcraft," has the courage of his convictions, when he pronounces against too much washing. I have not. Let the good reader suit his pleasure in this respect.

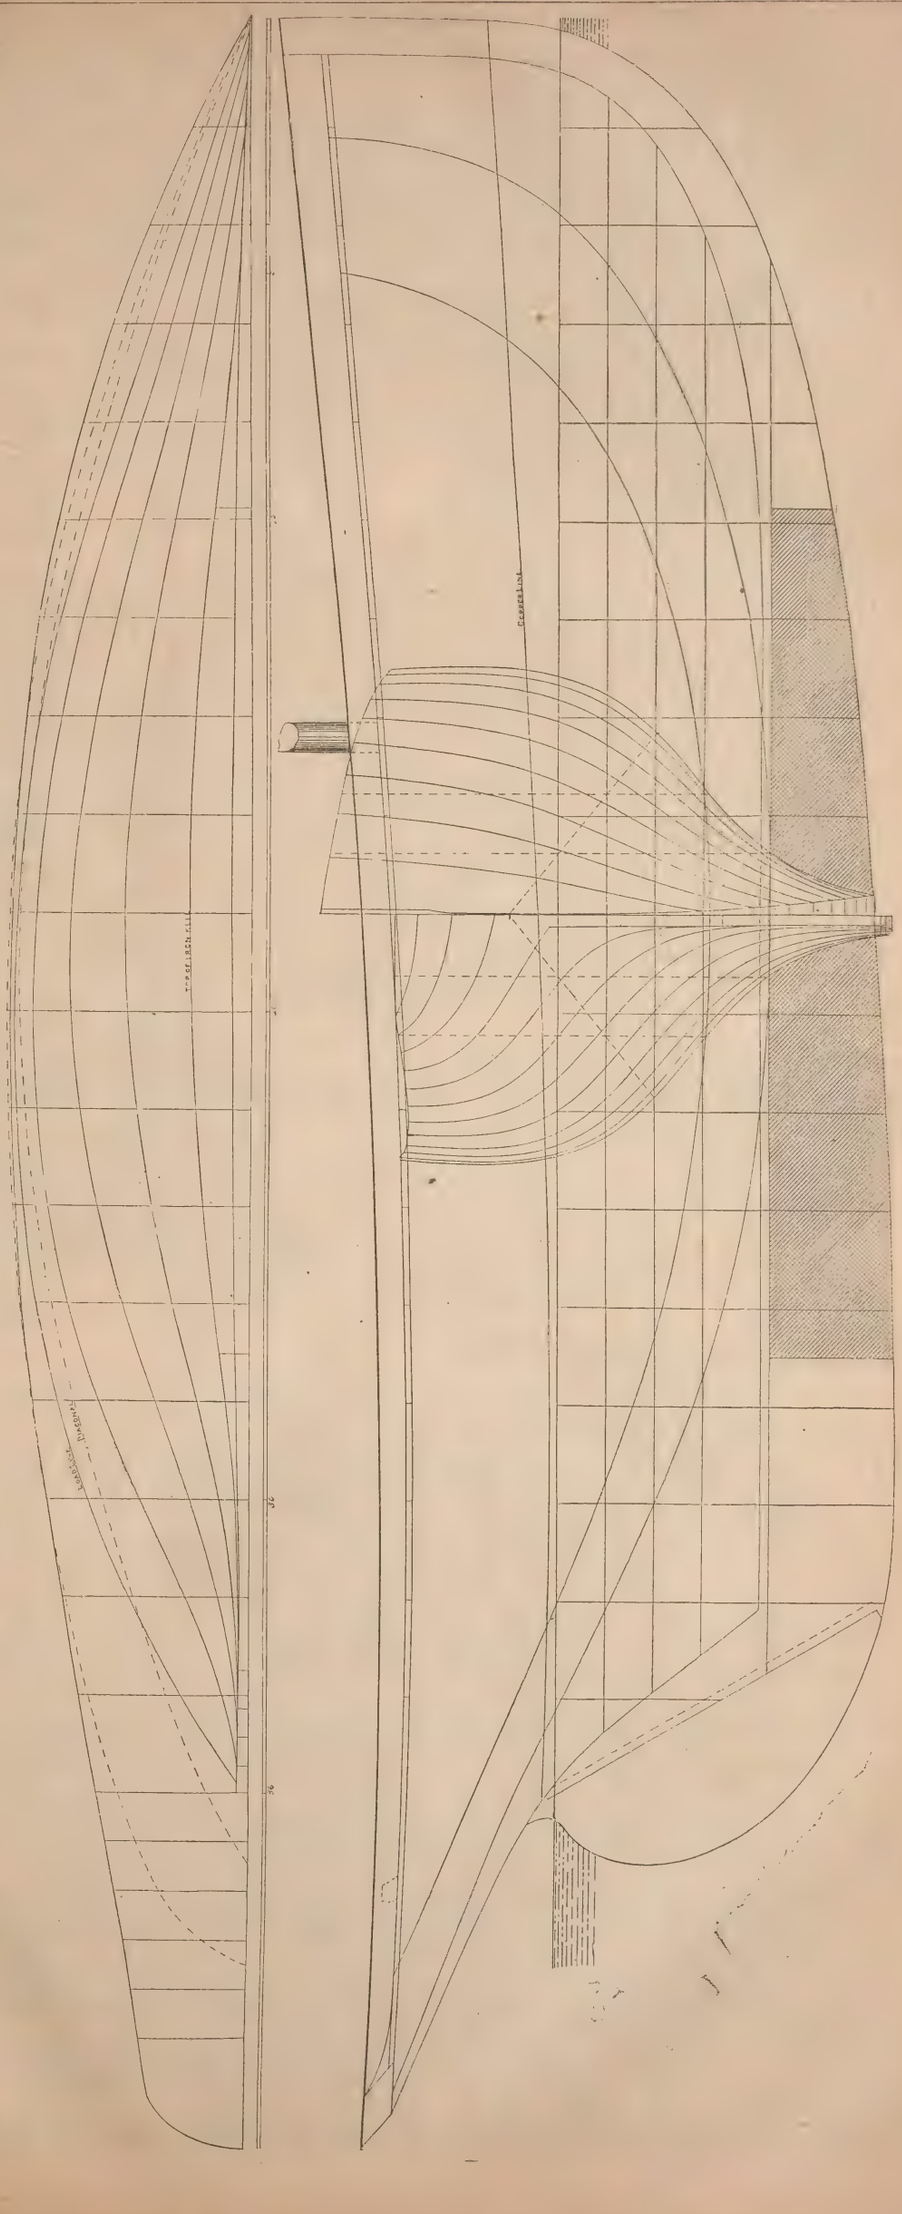
"Washing dishes must be a nuisance." So it is. But there are no dishes to wash. Had you said the dish, it would have been nearer the mark. One plate, one saucer, one cup, one knife, fork and spoon, are all the implements of war for a day's onslaught upon the larder. The pan, being "granite ware," requires cleaning not oftener than once in three weeks, if skillfully managed. Knife and fork are wiped in a towel. Cup is rinsed out with a few drops of fresh coffee as it is made, and the plate, it will serve for two meals in succession. In all these remarks to be enjoyed. And who could not clean one plate with a piece of newspaper? Dip it overboard, swab off with paper, dry with the towel, and the care of the pantry drops out of mind. Besides the pan, one empty tin for cooking various dishes. Pour out the liquids while still hot, and they become auto matic self cleaners. There are people so dainty that they cannot drink out of a glass rinsed in salt water. They will waste a pint of precious fluid from your breaker in scouring out before lifting the vessel to their lips. It is a case of sentiment and nothing else. Offer to the same people a freshly brought from shore glasses, one rinsed in salt, and the other in fresh water, and not one in a hundred can detect any difference. Domestic economy aboard a small craft demands that sentiment should be sunk out of sight, and sentiment, as

the reader will perceive, got no show in the Coot. We are creatures of habit, and judge everything by comparison. While fitting out in dreary November with leaden skies and blistering winds from northeast, it was a very cold and raw day when the thermometer indicated 50. After commission and sundry passages with the mercury down to freezing point, the fifties assumed an aspect quite tropical.

By the time the Coot had got caught with two reefs in the sail, a heavy snowfall obscuring the vision, and ice rapidly making, the mercury shrivelled to 32 was no longer dreaded, but welcomed as quite passable moderation in comparison. So it came to pass that the state of the thermometer no longer created alarm, and the probabilities of a cruise in midwinter did not deter the Coot from enjoying the prospects. As the frigid era advanced, the cold spells were prolonged and more intense. But seasoning to the atmosphere had likewise progressed in proportion. A warm breakfast fitted the crew to encounter the chilly blasts, and as the days were not long, a harbor sought in good time sent the frozen mariner below by sun down, to the welcome reception of a warm and snug cabin, to thaw and toast, followed by a hearty dinner, one pipe, and another followed by a third, and an evening of entertainment or leisure. Cruising in the cold which at one time seemed almost impracticable, lost its terrors and afforded just as good sport, and sometimes better, than drifting about under the sweltering sun of midsummer. When the anchor was lifted from the muddy bottom below Bordentown, on the Deleware, for example, the mercury indicated 21 degrees, but the sky was clear and the sun shone out bright. Unfortunately a light head wind and the flood tide brought the Coot again to her moorings two miles lower down. With a favorable wind a day's run of 30 to 40 miles could have been accomplished with the same ease as in warmer temperature. All this time no recourse was had to an overcoat, though underclothing and jerseys were doubled upon as a regular thing, and three pairs of stockings encased the slippered feet. At night, only half a blanket and an oil skin coat formed the covering, with one of the wicks turned down low in the oil stove, securing an average of 45 degrees in the cabin. A fresh current of air was provided through four auger holes, three quarters of an inch diameter, in the fore end of cabin, and similar outlets in the doors. These holes were never closed, so that neither the burning oil, nor the smoke from the skipper's pipe became disagreeable. Over the stove a tin can half full of water was always kept simmering to prevent impoverishing the air. I have spent a day and night with the cabin doors closed without any inconvenience except while cooking, when the fumes were permitted to escape with one door ajar about two inches. As opportunity offered, the cabin was thoroughly aired, bedding and oilcloths being deposited outside. In the way of fresh water, a ten gallon breaker would last about ten days with a little nursing. Fresh water was only used for making coffee and cooking.

THE CUTTER MELUSINA.

WHILE beam and draft, the latter coupled with metal keels, have long been rated at their full value in Boston waters, many of the yachts in which they have been combined have been faulty in one of two points. In some an excessive draft, greater than a cutter of the same length, has been coupled with a shoal body, the draft being due to a deep fin or keel, a form that is structurally weak in the event of taking the ground, and that is still more objectionable owing to the lack of headroom and cabin accommodations. Others, seeking to avoid this latter feature, have gone to the opposite extreme, and produced boats at once broad, of deep draft, and also with a depth of body which has increased the displacement inordinately, at the cost of speed and of snug rigs. In the yacht shown in the accompanying drawings it was sought to unite beam, depth and displacement in such proportions as would give a first-class cruising boat, mere speed being secondary to easy performance, ample deckroom, a fair amount of initial stability for comfort, and room below for living on board. The Melusina was designed by Mr. Geo. K. Boutelle, A. S. N. A., of Waterville, Me., for Mr. Horace Binney, of Providence, former owner of the keel sloop Moya. She was built in the winter of 1884-5 by Lawley & Son, of South Boston, under the superintendence Mr. Edward Burgess. Owing to her owner's illness this season she was not put afloat, although completed last spring, and so no knowledge of her speed or seagoing qualities can be had; but a look at her handsome form, wide, roomy decks and commodious cabins is convincing proof of the excellence of this type of boat as a cruiser, and its superiority over some of the mongrels classed generally as "compromise," where the required draft, 7ft., is not too great. The dimensions and elements are as follows:



Length over all	49ft. 9in.
Length L. W. L.	36ft.
Beam at L. W. L.	9.85ft.
Beam, extreme	10.20ft.
Draft, maximum	7.00ft.
Draft, mean	5 86ft.
Least freeboard	3ft. 1½in
Displacement (long tons)	19.02
Iron on keel	9 5 tons.
Area midship section	31 1 sq.ft.
Area immersed longitudinal section	210.4 sq.ft.
Area load water plane	234.0 sq ft.
Area wetted surface	501.5 sq. ft.
Midship section from end of L.W L.	19.14ft.
Center of buoyancy from end of L.W.L.	18 76ft.
Center of gravity L. W. P from end of L. W. L.	19 80ft.
Center of lateral resistance from end of L.W.L.	20.23ft.
Center of buoyancy below L W. L.	2 04ft.
Metacenter above C. B.	1.96ft
Mast, deck to hounds	29.06ft.
Topmast, fid to shoulder	26.00ft.
Main boom	34.00ft.
Main gaff	34.00ft.
Bowsprit, stem to pin	19.00ft.
Topsail yard	25.00ft.
Mast from end of L. W. L.	14.4ft.
Area mainsail	895 sq.ft.
Area foresail	178 sq.ft.
Area jib	286 sq.ft.—
Area plain sail	1,359 sq.ft.
Area gafftopsail	346 sq.ft.
Sail area per square foot wetted surface	2.71
Ratio sail area to (L. W. L.)²	1.04
Center of effort from end of L. W. L.	19.63ft.
Center of effort forward of center of lateral resistance	7¼in.

Convenience and comfort in cruising being the chief objects, the beam was made ample so as to give good deck and thwartships cabin room, while the displacement was made as large as seemed consistent with a good average of performance. Iron was chosen for ballast, and in order to secure its longitudinal distribution within proper limits, the rabbet of the garboard was carried high up, the lower side of the wooden keel made very wide, 2.5ft. amidships, and the iron casting so moulded as to carry out the curve of the floors down to the bottom. Thus almost the whole of the ballast was got on the keel without too much spreading fore and aft.

In the arrangement of displacement the attainment of good seagoing qualities was kept in view, and to that end the midship section was put somewhat further forward than usual, and the radius of the construction circle was made rather small. Thus, while a pure waveform was secured, the fore and after bodies were nearly balanced, the center of buoyancy being only about 9in. abaft the middle of the loadline. The center of gravity of the load waterplane is only about 6in. abaft the center of buoyancy, thus it is safe to conclude that no great pitching moment will be found in that neighborhood.

In fixing the amount of canvas it was desired to keep the area of plain sail moderate as far as seemed consistent with the attainment of a reasonable speed in light winds. Owing to the general fullness of the lines it was found possible to secure a fairly high ratio of sail area to wetted surface, as an indication of what might be expected within the limits of the application of the ratio, and at the same time to keep the ratio to the square of the loadline as small as is usually found in boats of a similar kind.

In details of material, workmanship and proportion, the Melusina is an excellent example of modern yacht construction at a moderate cost. The workmanship and finish is strong, substantial and shipshape, without costly and useless elaboration, but the general effect, whether on the clean bright deck with its polished elm rail and mahogany bulwarks, or below in the snug cabin with hardwood fittings and cheerful fireplace, will delight the genuine sailor man. The frame is of white oak, the keel being 30in. wide on top, 25in. on bottom and 8in. deep. As mentioned above, the iron keel is shaped to it so that the body lines are fair from bottom of keel to gunwale, with no angle at the rabbet. The bolts of the iron keel are 1¼in. diameter and spaced 12in. The frames are double, 2¼in. sided, moulded 4in. at heels and 2½in. at heads, and spaced 12in. at centers. On each is a floor of galvanized wrought iron, running well up the double frame and heavily bolted to them and the keel. The stem is sided 5in. and moulded 9in.; the sternpost is sided 6in. and moulded 12in at heel. The shelf of oak is 3x4in., securely bolted, and the clamps are 1½in thick, 8in. deep amidships and tapering to 5in. at ends; while the bilge clamps, one on each side, are of the same dimensions. The planking is of yellow pine 1½in. thick, with oak wales. The deck is of white pine, 1½x3in., on beams 2½x2½in. The low bulwarks are of mahogany, with locust stanchions and elm rail, while the forward hatch, main and after skylight and companion sail hatch and cockpit are of mahogany. The deck, interior and sail plans, which will follow shortly, will give a more complete idea of the special features of the boat comfort—accommodation and easy handling.

BOAT STOVES, DORIES AND YAWL RIG.

Editor Forest and Stream:

I see by an inquiry in last number that the old question as to the best stove for a small boat will not rest. In the hope that it may help some solitary cruiser, I send the following description of a stove which I used for eight years in cruising and fishing with the greatest satisfaction. It was nothing more than a tinsmith's stove for heating his irons, modified but little. I had it built of strong galvanized iron 9in. high; diameter, I think, about 6in., but wide enough to allow a one quart tin kettle to enter the top easily. Two inches from the bottom was the draft hole, and 3in. from bottom I had it brackets clinched on, upon which rested a perforated piece of strong sheet iron of the same diameter as the stove. The stove had a heavy rim on the top and a bail also clinched. The bottom had a flat rim with which the stove was run into two iron slides fastened upon a heavy piece of maple plank 7½in. square, and which was further protected by a piece of polishing felt as a non-conductor. The bottom of the stove rested directly on the felt. The fire was made with a piece of paper, a little driftwood for kindling, and charcoal, and in a few minutes I had a good cooking fire and heat enough to warm hands and feet with in cold weather. Of course, I could cook but one course of a not over elaborate dinner at once, but I have managed to have clam chowder, chicken fricassee, beef a la mode, potatoes and coffee from the same fire at one meal, and all smoking hot. The advantages of such a contrivance are, that you can get a fire in a heavy blow without fear of spilling kerosene, which may ignite; you may set your stove on any part of the boat where you are not bothered with the smoke or smell, and after the charcoal is burning well it gives forth a tremendous heat for such a little fireplace. Put the stove in the bottom of your boat and in a short time your feet and the lower part of your body will be comfortably warm, while you can lay your rod by, and warm your hands also. Fishing for striped bass in November and December such a little stove is a great boon. The charcoal may be kept in a rubber or leather bag, and will never make a dirty boat. To put out the fire I poured water over it and picked out the coal not consumed, which is good for further use. According to use, especially on salt water, you may have to get a new stove every three or four years, but as you can have one made by any tinsmith for about $1, the expense is slight.

Lately there has been a good deal of discussion going on in regard to small boats of all kinds, and the sneakbox has received a good deal of merited attention. There is another style of boat which after all seems to me to be the boat for taking all kinds of weather without being too much for one man to handle. I refer to the Gloucester dory. The Little Western, 16ft. over all, went to London in 49 days and returned in 75 days, having on the return voyage exceedingly heavy weather of almost continued head winds. After inspecting the boat closely, I had a long talk with Fred Norman as to her sea-going qualities and he could not praise her highly enough. Of course she was decked all over, and there was just enough room in the hold for one man to sit and steer, but Norman ventured the assertion that she was so buoyant and lively that a half deck with a slide for the other half would have been all sufficient, even in their worst gales, and in quieter water infinitely more comfortable. The little boat had a jib, staysail and mainsail, 13½ft. keel, 2½ft. deep, 6ft. 8in. beam. She made on her way out an average of 63 miles per day. Her best run was 163 miles. The Little Western was the third Gloucester-built dory to cross the Atlantic. Alfred Johnson crossed alone in the Centennial in 1876, and Andrews and Boos in the Nautilus in 1878. The rigs of the two last boats I do not know. It would be of great interest to many readers to have the merits and probable shortcomings of this class of boats discussed. While I am about it I would like to say a good word for the yawl rig. I had a 22ft. cabin boat, 10ft. beam 1½ft. deep, built for cruising purposes and fitted it with a yawl rig—double headsails, or rather staysails and jib with cuthaul and set on its own hoist, mainsail, mizzen and clubtopsail. She was an exceedingly heavy built boat, but she would maneuver with either jib and mizzen, staysail and mainsail or under mainsail alone. With this rig I sailed her singlehanded. The halliards all lead to the cockpit and I did not need to leave the tiller to let the mainsail come down on top of the cabin where the boom was fastened without furling the the sail. This down it never blew hard enough to get her lee rail within 2in. of the water. Now with a sloop or cutter rig this sailing would have been an utter impossibility to one man. For cruising purposes there is no rig which is so comfortable and safe as the yawl rig. PISCATOR.

OPEN BOATS AT SEA.

ACCOUNTS of adventures of landsmen in boats are evidently held in high estimation by their brethren ashore, to judge by the prominence given in the daily press to every little journey performed by amateur boatmen. Only the other day the whole civilized world was made aware that an Oxford eight had performed the by no means difficult task of rowing in a calm the short distance from Dover to Calais. A little time afterward there appeared the adventures of other individuals who endeavored to follow their example, and finally for the want of an actual journey to record, there was a paragraph to the effect that a gentleman and his daughter proposed to cross the Channel in a small steam launch.

Very different is the matter-of-course manner in which are received the accounts of tasks performed in boats by seamen compelled to abandon their vessel. If by chance the vessel has passengers a little more interest may be displayed, and survivors may possibly be interviewed, and a thrilling account of the affair published, but in the case of the crew of a bumble cargo vessel that little interest vanishes. The following short accounts of the adventures which befel the crews of three British vessels in the Arabian Sea in June last, are given, not with the view to show that the tasks performed were in any way out of the common for sailors to perform, but to prove by comparison how insignificant were the doings of those individuals to which so much attention has been directed of late.

The first abandonment, in order of date, was that of the Copeland Isle. She was a wooden bark of 661 tons, and sailed from Rangoon on April 1, 1885, for Bombay, with a cargo of rice. She was commanded by Captain James Ferguson, and had two European officers, but the remainder of her crew of twenty-six were Lascars. On June 9, during bad weather, she commenced to leak, and four days later, in spite of incessant pumping, the water had so increased that it became imperative to abandon her. One of her boats had been so injured as to be useless, another was smashed while being launched, but the third, a boat of 29ft. in length by 8ft. 6in. in breadth, was successfully floated, and at 5 P. M. of June 10 the crew got into her. There were no provisions in the boat except two pounds of flour, as the rest had to be thrown overboard to lighten the weights as much as possible; and they had no fresh water, as they could not get to the tanks on account of the quantity of water on the ship's deck. Canvas was nailed round the gunwale of the boat to keep the sea from breaking on board. The captain states they proceeded toward the Malabar coast, which was 98 miles distant, keeping the boat before the wind and sea, and on June 13, after suffering great privations, they arrived at Kumta.

The second case was that of the Seraglio. She was a steamship of 1,165 tons, and sailed from Cardiff on the 10th of May last, under the command of Captain Wilson, and manned by a crew of twenty-four hands, bound for Bombay, with a cargo of coal. On June 9 she encountered a cyclone, and commenced to leak. The following night the water had so gained on the pumps that all the fires were drowned out, and bailing had to be resorted to, but in spite of the exertions of the crew, by the morning of June 13 it became evident that the vessel was on the point of foundering. At noon, therefore, the only boat which had not been rendered utterly useless during the storm was launched, and the crew embarked in her, and a course was set for Bombay, which was 350 miles distant. The boat was 27ft. long, 8ft. broad and 4ft. deep, and was fitted with a mast and sail, but the former proving too heavy for boisterous weather, it was thrown overboard, and an oar used as a jury mast. Six cork life jackets were fastened to the sides of the boat and canvas nailed over; and in order to lighten her as much as possible, the crew were only allowed to retain their shirts and trousers. After being three days thirteen hours in the boat they reached Bombay at 1 A. M. of June 17, having nearly exhausted their scanty store of provisions.

The third abandonment was that of the Sieve More. She was an iron ship of 1,666 tons, and sailed from the Tyne on March 30, bound for Bombay, with a cargo of coal. Her commander was Captain H. B. Couby and her crew consisted of thirty two hands all told. When nearly three months out and in the Indian Ocean, lat. 3° 38′ S., long. 63° 40′ E., she was found to be on fire. All attempts to extinguish it proving useless, it became apparent to the master that he would be compelled to abandon his vessel. The two lifeboats, the cutter and the gig were got overboard and provisioned, and at 6 A. M. Tuesday morning, June 16, the crew took to their boats. They lay by the burning ship until the following morning, when the mast having all fallen, but the hull still burning fiercely, they left her and made sail for the Seychelles, which was 500 miles distant. It was soon found that there was too much sea to sail the gig with safety, and she was consequently abandoned. On Thursday, June 18, the wind freshening and the sea getting up, the people in the cutter were transferred to the lifeboats, and she was also left behind. At night a light was hoisted on each boat, by which means they kept together. On Friday, June 19, a heavy gale was encountered, but the boats, much to the astonishment of their inmates, succeeded in riding it out to a sea anchor made out of the oars and sails. Oil was poured overboard with the view to smooth the sea. During this night, however, the boats parted company. On June 21 the master's boat was picked up by a country brig, which landed its occupants in the Seychelles five days later. On June 25 the boat in charge of the mate, Mr. William Alfred, reached the Seychelles, the crew being none the worse for their nine days' exposure.

It will have been observed how closely the misfortunes which befell the crews of these vessels, bound to the same port, followed each other, and to show the coincidence more clearly the dates are repeated.

Copeland Isle abandoned	June 10,	crew in boat till	June 13.
Seraglio "	June 13,	"	June 17.
Sieve More "	June 17,	"	June 25.

The release of the one crew from their confinement was thus the signal for the others to commence their labors.—*Nautical Magazine.*

MORE LEAD ON THE KEEL.—Last week the schooner Norseman, that has been lately refitting at Poillon's, hauled out on the screw dock and had her wood keel partly cut away and ten tons of lead taken from inside and substituted in the keel.

GENESTA AND HER OWNER.—It is rumored that Genesta will fit out for the B Class next year. The schooner Elmina, Sir Richard Sutton, has completed her fitting out and will leave at once for the Mediterranean.

LLOYD'S YACHT REGISTER.—We have received the second supplement for 1885 of this useful list. Galatea is listed at 90 tons: 90.5ft. stem to sternpost on deck; beam, 15.1ft.; depth, 13.3ft.; rating 100 A1.

NICE REGATTA.—The dates for the spring regattas in the Mediterranean are as follows: Mentone, March 31, April 1; Nice, April 7, 8; Cannes, April 15, 16; Toulon, April 25, 26; Marseilles, May 2, 3.

A NEW STEAM LAUNCH.—Mr. Samuel Ayers, of 37 Peck Slip, New York, is now building in stock a handsome little launch 32ft. long, 7ft. beam, and 32in. draft.

MIRANDA.—It is reported in *Le Yacht* that Miranda has been purchased by an American.

Canoeing.

NEW YORK CANOE CLUB ANNUAL DINNER.

WHETHER afloat or ashore, it is the ambition of each and every man of the New York Canoe Club to do everything in a "shipscape and Bristol fashion;" and their annual dinners are no exception to the rule. No greater contrast to the free open life of the camp and woods can be found than the conventional dinner, with its sombre and formal dress suit, but as usual the canoeists managed to outrage the proprieties and set at naught all conventional rules, to the astonishment and dismay of the waiters of the Hotel Hungaria. The soup was not scorched, the venison did not smell of smoke, there were no wood ashes in the dessert, but still there was a marked nautical flavor, to say nothing of an "ancient and fish-like smell" to all the surroundings, that went far to compensate for the fact that they had to eat off a table with a cloth on, they had different spoons for soup and dessert, and there were no such delicacies as canned corn beef, Brunswick soup, eggs or canned beans on the bill of fare. The committee of arrangements, Messrs. Burchard and Rogers, had racked their brains and sacked several other junk shops with astounding results in interior decoration. The long upper room was hung with silk and bunting, from the large club banner to numerous smaller prize flags, numbering the club's victories at Lake George, Newburgh, Grindstone and other places. Above the entire length of the table hung a string of fifteen small Chinese lanterns, each with a date from 1871 to 1875. From one chandelier was hung a native model of a double kayak with two occupants, from another hung a model of an Alaska canoe, and from a third a birch. No epergnes were visible, but their places were taken by a large yacht's binnacle at one end and a foghorn four feet long gracefully supported by a 7in. double block, and both were filled with flowers. Besides these, a ship's bell at the head of the table and a collection of marlin spikes, belaying pins and other articles of vertu lent an air of home comfort to the repast.

The menu cards, designed by Mr. Rogers, were really artistic, and to each was added a little red and white burgee, a contribution from a lady member. Over the for'ard mantel was a large ship's wheel, flanked by a pair of side lights and some blocks; on the after one were another pair of lights, a sextant, and a design (the lowest bid) for the Challenge Cup. The main features of the design were a tin plate and a tomato can, the latter gracefully supported on a tripod of forks and pipes. On the piano rested a coil of old rope, crowned with a red globe lantern, and about the walls were paddles, savage and civilized, and some models of canoes. Before the dinner a meeting was held, at which Messrs. C. K. Munroe and W. P. Stephens, commodore and vice-commodore, were re-elected, and Mr. C. J. Stevens was chosen secretary. Messrs. H. O. Bailey and B. F. Curtis were elected as executive committee. After some routine business the meeting adjourned and the serious business of the evening was begun by a blast from a large patent fog horn, in the capable hands of Mr. Burchard. The Mohican C. C. was represented among the guests by Mr. P. M. Wackenhagen, and the Knickerbocker C. C. by Com. Greenleaf and Messrs. Arthur Brentano and Seavey, the total number at the table being 28. The first proceeding was to drink, not in ice water or sherbert, the health of the hostess of last year's dinner, Miss Parlon, after proposing which the Commodore made a short speech. Among the toasts were "The New York C. C.," responded to by Mr. Burchard; "Our Guests," Mr. Seavey; "Our Old Members," Mr. C. L. Norton; "Other Clubs," Com. Greenleaf; "The Royal C. C.," C. J. Stevens, and "The A. C. A.," responded to by the vice-commodore. At 11:30 the departure of the Staten Island contingent was the signal for a general leave taking.

REFORMS IN BRITISH CANOEING.

IN THE last issue of the *Field*, Mr. W. Baden Powell writes as follows in favor of the proposed changes in the rules of the Royal Canoe Club. The results of the meeting of Dec. 8 have not yet come to hand:

"In the pleasant little world of canoeing there is, in the R. C. C., just now a pitched battle going on of cruising interests vs. the anti-cruising existing state of things. Many letters to the *Field* on this subject have appeared during the past two months, and, with but one exception, they have loudly proclaimed on the cruising side, the one exception being, as the letter says, 'an earnest entreaty against all changes.'

"The autumn meeting of the Royal C. C. stands adjourned till Tuesday next, the 8th, when the fate of canoeing reform will again be put in the balance, and therefore a word or two in the *Field* before that event will be worth pages on pages after it.

"The point I desire to lay clearly before your canoeing readers, is that cruising and racing are not, and ought not to be independent of one another. They hold equal interest in the rules, especially those of classification.

"It will be conceded that the majority of new canoes are built for competition in the races, and that a vast number of canoes pass through racing hands into cruising hands. It is therefore of the first importance, from a cruising point of view, that the type of craft best suited for general cruising should also be most largely patronized for racing, the result being a constantly flowing supply, of cruisable craft of the best design, build, material and fittings.

"Let cruisers see this clearly; let them see that this is to be to the interest of cruising to keep the racer within the dimensions, weights, areas, etc., best suited for cruising; let them come to the meeting and support reform in that direction, and they will find that they have not only benefited themselves, but promoted canoeing.

"Apart from the one or two members who raise their objection to all or any changes, there are those who are prejudiced in favor of things as they exist, not from any real belief that perfection of rules has been arrived at, but that in reform they sniff a lowering of the specialist to the level of common competition; a taking away of the refinement of his art, and causing him to compete on an equal footing, as regard implements, with the ordinary cruiser.

"Is this not so? Take the question of the abolition of side deck flaps. The majority of opinion on the cruising side is that deck flaps are utterly out of place in a cruising canoe—that is, if she is to be used for other work than merely sailing on sea or lake. Even at sea they are dangerous; a flap broken off and lost when a mile or two from land in rough water, would very possibly end fatally, unless the lifeboat arrangements within the canoe are of a first-class nature.

"Then why retain or allow a form of structure which weakens the canoe where she most needs strength, which is a standing danger to her at sea, and a constant annoyance in admitting water freely below, simply because, in racing, the side flap enables the crew to sit low, and so to windward, where the cruising canoe's crew can't get, and so to carry extra large sails?

"Take the question of limiting the weight of center plates to 60 pounds (about as much as one man can conveniently handle into and out of his canoe), why is there opposition to this measure of reform? Well, because there are some three or four existing in racing craft which are heavier (mine among them) and if you reduce the weight, sail must also be reduced.

"But the greatest hardship of all—to the racer—is that proposal to limit sail area. But, to my mind, it cuts at the root of the whole evil; limit the sail area, and most of the anti-cruising forms and fixings will vanish. But all the racers would have to alter, and reduce their beautiful spars and sails. And why not? The same canoes will sail well with less sail, and be more cruiseable and generally popular, as good for both racing and cruising, when their spars, sails and ballast are lightened to reasonable amounts. The existing racers number some six or seven (who compete), may there not be a dozen or more who would come in and compete if they knew that model and handling would be put to the test rather than sail spread and lead ballast?

"Existing canoes in the first class are nearly all of a size; those that are fitted with deck flaps (four canoes) would, if they had to screw them up, be placed merely on a level footing with those (many in number) built with fixed side decks; where is the injustice? What is the number of canoes with center-plates over 60 pounds in weight? Four, or perhaps five. Put a stop to it in good time.

"Who carry sail over 100 sq. ft. in the working sails? About four. Who are they? The invariable winners of the sailing races, 130 to 150 sq. ft. being often set. Cut them down to a liberal idea for racing first class, and a snug proportion as "cruising area." The A. C. A. cruising allowance was, last year, 75 sq. ft.; then, taking that for "cruising area," add one-third and put the "racing" at 100ft. In each case the mainsail should not exceed two-thirds of the area. Spinnakers can well be left unfettered, and give the expert a chance of exhibiting his ingenuity.

"But those who wish to see healthy reform must remember that it will not come of itself, that it needs substantial support at the meeting, for it is almost too much to expect that the vested interest holders will stay away from the meeting or abstain from opposing measures which effect them so directly, and, in their opinion, so adversely. "If cruisers, and those desirous of fair play to average canoes will attend on Tuesday and carry the proposed reforms, I have no doubt but a healthy impetus will be given to canoeing.

"The new Nautilus, which is now built, is ready to take either the large sails, long spars, and heavy ballast of the present, or the small sails, snug spars, and light ballast of the reform; I should prefer the latter, and I certainly do not wish to disfigure her decks by cutting and fitting those racing dodges, side deck flaps. NAUTILUS."

WIDE OR NARROW CANOES.

Editor Forest and Stream:

On the whole I must heartily regret not having long since fraternized with my boating brothers of the paddle, for a high spirited and plucky crew are they.

Last month, in fear and trembling, I asked through your canoe columns a few simple questions, and now — well, my queries seem to be answered with a vengeance, in your issue of Dec. 10. All right "Class B," and "A. C. A." and "L." and "Katrina," and "Surge," you must be correct. There are so many of you; but all the same I am in receipt of a number of canoeists' letters indorsing my suggestions as to the advisability of making a new class for canoes 36in. in width, because very narrow canoes are "cranky, uncomfortable and dangerous for sailing purposes on waters wider than a trout brook." Bless your honest, pugnacious hearts, I have no desire to abolish your nice little light-weight boats. They are very pretty and, as you say, just the thing to "travel with on railroad cars," hold over your head for umbrellas, "hike out to windward on, with half your nether anatomies hanging overboard every time it breezes, and to yank out of the water on to the top of a 5ft. high deck with a fish line. Yet, my friends, ere you crush me completely, let me whisper: I did not do it. It was another fellow. He said his 32in. canoe was too narrow for open water sailing, and he wanted a wider boat, one that would go faster and did not disgrace her ancestors, the kyak and the birch, by carrying lead under her to make her stand up like a cutter. You know, and that would float without airtanks that sometimes filled with water when he capsized, and he wanted one boat to do my little cruiser wish would carry even her racing spars and sails all snugly stowed under her deck. In short, he would like, if you would let him, to have a canoe that will not capsize at all, under ordinary circumstances, and which he can row faster and further than your ninety-pounder can paddle.

Now go for that other fellow. He's right among you, a good many of him, and he is "takin' notes." Let me say to "Class B" that my proposed canoe will "go to windward in a sea without ballast," at the same time being far stiffer, dryer and faster than any existing Class B canoe.

To "A. C. A." I would remark that she will cost complete $125 or more, and will weigh not far from 100 pounds. A very small boy can handle her nicely. She will never miss stays; and that the rest of his conundrums are too much for me.

To "Surge" I will whisper that it is my intention to get among the canoeists next summer, and show them the capabilities of a commonsense canoe, just as I have already shown that a 15ft. sharpie can cover nearly two feet to the one of a narrow sailing canoe in a race.

Would "Surge" like to help me win $25 more for the N. Y. C. C. challenge cup? If so I will be glad to thus christen the "Common-Sense Canoe," and will give her an extra inch of beam to emphasize matters.

My desire is to improve the open-water sailing canoe, not to force canoeists out of their favorite craft into square-ended sailboats, and I hereby ask all those in favor of keeping canoeists in their canoes to express their views. THOMAS CLAPHAM.

ROSLYN, L. I., Dec. 12.

Editor Forest and Stream:

The defenders of the canoe admit that some other kinds of boat are equal, or superior, to the regulation canoe in some respects; but cling to the statement that she is unequalled for ease of paddling, and of carrying by one man on shore. Now, it seems to me they forget the large number of boats known as "guide boats" or "Adirondack" boats that are being rowed or paddled (single blade), rapidly and easily, all through the Adirondack region, and at the carries mounted upon the shoulder of one man and carried as easily for miles; a boat capable of carrying four persons, only weighing from 60 to 75 pounds, and of course they could be made much smaller and lighter if made with the object of accommodating but one man and luggage. I look with a kindly eye upon the canoe, but want for my use a craft that will carry three or four persons and at the same time can be rowed easily for a long distance, or paddled satisfactorily under proper conditions or sailed with a fair wind, and at the same time built so lightly that I can take it from the water and carry it around dams, etc., with ease. I am having a boat built this winter about 14ft. long, 48in. wide and 12in. deep amidship, with considerable sheer both fore and aft. Both boats made by her builder are modeled somewhat after the birch canoe, in that they are sharp at both ends and have the same sheer appearance, but are superior, in that they are stronger, tighter and lighter, and the lines are truer and more perfect; consequently will paddle easier and have the advantage of rowing or sailing. It seems to me I shall have about all the advantages claimed for the paddling-sailing canoe, and some others that the canoe lacks.

BOSTON, Dec. 11. LICHEN.

[The excellent qualities of these boats are generally admitted, but they are really an outgrowth of the canoe, enlarged and widened a little, and are no more than large open canoes, in which oars and thwarts are added. For work in the woods they are excellent, but to suit the purposes of the ordinary canoeist, decks, mast tubes, keel or board, etc., must be added, and then they would be identical, except in size, with the modern canoe.]

NOVICES AS RACERS.—*Editor Forest and Stream:* "Spike's" letter of a few weeks ago aroused in me the desire to rush into print, but the moment passed and was about forgotten when his second communication reminded me; so this present infliction please charge to his account. He says it takes years of experience and constant practice to carry the spread of canvas upon a canoe now common among racers, and my thoughts turned to two fellows who went to Grindstone Island last summer with little experience and less practice, and yet were foolish enough to enter the sailing races there; and though you know them both, Mr. Editor, and the result of their folly, you may not be aware of their ridiculous lack of preparation, so, with your permission, I will tell the tale, and to spare their blushes will call them Messrs. A. and B. In March, 1884, A. had never been in a canoe; but, as the freak of an idle moment, he ordered one, and was in her a few times with a small pair of sails before he went off to Europe for the summer. In September he returned, and, after a few more trials with somewhat larger sails, entered the club regatta and took a first and second prize. Then the cold weather came along, so he put his canoe in the barn and ordered a larger pair of sails for the next season. In February, 1885, he went off to Florida and elsewhere and never reached home again until July, when he shipped his canoe and his half-rigged sails to the meet, which he reached himself on Wednesday of the first week; his canoe not having been yet since the early part of the preceding October. Yet, his infatuated mortal went to rigging and monkeying, and when the first race day came around he was on hand with a piece of board lashed across his coaming for a deck seat. Now for our other friend, Mr. B. He began his career as a canoeist early in 1883, but his ardor was dampened by an upset the first time he ventured to carry sail. He jibed, and the end of his first season saw him seated in the bottom of his canoe, where he hastened to ease out the sheet of his 30ft. sail every time a breath happened to touch it. In 1884, however, he went to the A. C. A. meet, and the steady wind encouraged him to take a seat upon the sharp edge of his coaming, where he crouched in much fear and trembling. Before long he discovered that he had immensely more control of his canoe than when sitting in her and he promptly entered the sailing races, with

the proper reward for his folly, for I believe he was sixteenth at the finish of the first one. Well, he went home and did up the other fellows who had not been to the meet and dreamed of what he would do next year, but when 1885 came around he was occupied by business and finally started for the Thousand Islands, having had sail up just eight times during the preceding three months. When he arrived at the camp he unpacked a pair of 100ft. sails, so new that their masts had never even set in their tubes in his canoe. These he hoisted once when the wind died out before he had gone a quarter of a mile, and again when the wind breezed up and drove him back for smaller sails, yet when race day came around there he was with just those two experiences in carrying large sail, but ready to compete with the old and weather-beaten seamen of the A. C. A. Now here we have these two chaps, A and B, handing in their entries until between them they had put up nine (by the way, this manner of speaking of them may give rise to the belief that they were somehow connected, but no matter, it will help to conceal their identity), and any one can guess where the finish of each race found them. So to make a quick ending to a long story, I will just say that when the prizes were given out on Capitol Hill that last Friday morning, had any one kept count of the number of times A and B were called up, he would have found that between them for their nine entries they had just seven prizes to show, including firsts, seconds and specials; merely this and nothing more. So as every word of the above is absolutely and strictly true, let no novice be appalled.—TEMECULA.

THE LIVERPOOL NAVIGATION EXHIBITION.—Toms River, N. J., Dec. 9.—*Editor Forest and Stream:* I have just received from Mr. William S. Holden, 2 Prince's Park Terrace, Liverpool, England, a communication regarding the International Exhibition of Navigation, Traveling, Commerce and Manufacture to be held in Liverpool during the year 1886 "under the patronage of Her Majesty the Queen and the Presidency of His Royal Highness the Prince of Wales." Mr. Holden is one of the officers of the Mersey Canoe Club, of Liverpool, and visited the writer at Lake George, N. Y., about two years ago. He is an enthusiastic canoeist, and has followed the development of canoeing as a pastime in America since the birth of the American Canoe Association with careful attention. He is a friend of the A. C. A., and has done much in posting his brother canoeist in England regarding its history, progress and intentions. Mr. Holden has been placed upon the Sectional Committee of Navigation in the First Division; and it is his desire to see America well represented in the exhibition. If our canoe clubs, or individual canoeists, as well as canoe and boat builders, will address a letter to Mr. Holden he will cheerfully advise them and assist them in the matter of representation of articles they may desire to place on exhibition. The canoe has received such remarkable development since 1880 that a very interesting exhibition of its evolution in the United States and Canada might be easily made, side by side with what Great Britain will also show to the millions who will visit Liverpool during the year 1886. Action in this matter should be prompt, as the time of reception of exhibits is covered by the following rule: "4. No goods will be received previous to the 1st of March, 1886, without special permission; and no goods will be received after the 15th April, 1886." Correspondence may be opened at once with Mr. William T. Holden, 3 Prince's Park Terrace, Liverpool, England.—NATHANIEL H. BISHOP.

AN IMPERIAL CANOEIST.—The Archduke John, of Austria, made the descent of the Danube, from Linz to Vienna, lately, in a canoe. The distance is 140 miles, and the Archduke, with an aid de camp in another canoe, covered it in 22 hours, according to the report in the London *Guardian*.

OTTAWA C. C.—The annual ball of the Ottawa C. C. will be held in the Royal Roller Rink, at Ottawa, on Dec. 29. The committee are Messrs. Brough, Wicksteed, Lelievre, Baldwin and McQuilkin.

MARMALADE LODGE.—"Thetis," of Albany, was a guest at Marmalade Lodge last Sunday, and in spite of the storm was out in the Tomboy in the afternoon.

BROOKLYN C. C.—*Editor Forest and Stream:* The regular monthly meeting of the Brooklyn Canoe and Sailing Club was held December 8th, at the Brooklyn Library. Our constitution had previously been so amended that our officers consist of a commodore, vice-commodore and secretary. The reports of officers for 1885 were accepted for the ensuing year by unanimous election: J. F. Newman, Commodore; William Whitlock, Vice Commodore, and M. V. Brokaw, Secretary (re-elected). Our club was organized less than one year ago by nine members with eight canoes. We now have a membership of twenty-one with a fleet of sixteen canoes and four large sailboats. Five new canoes of various models, by Everson, will be added to our fleet next season. Our club house with locker room on the second floor we find both roomy and comfortable. Our location inside of Mumm's Basin, at the foot of Fifty-fifth street, Brooklyn, is a very desirable one, and very convenient especially in rough weather, while we believe we have in our immediate vicinity the best canoeing water about New York Bay. On Jan. 12 (the anniversary of our organization) we are to have our first annual club dinner. The club is entirely free from debt, and looking upon the results of our work of the past year we anticipate a pleasant and successful year to come.—M. V. B.

THE A. C. A. TROPHY.—Subscriptions of $1 each to the fund for the A. C. A. Trophy may be sent to Mr. Wm. Whitlock, Nos. 37 and 39 West Twenty second street, New York, chairman of the committee. The following subscriptions have been received since last week: Geo. E. Andrews (A. C. A. 900), $1; Emil C. Knappe (A. C. A. 630), $1; Chas. F. Dodge (A. C. A. 198), $1. Previously acknowledged, $57. Total to date $60.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

F. H. M., Ottawa, Can.—Measure from nose to set on of tail.

P. E. A., Monroetown, Pa.—See advertisement of snowshoes.

D. A. G., Newburyport, Mass.—Write to Gen. W. G. Ely, Norwich, Conn.

J. G. F., Boston, Mass.—Write to John E. Thayer, Lancaster, Mass.

H. M. W., Baltimore, Md.—Follow the rules in "Training versus Breaking."

C. A. E., Elk Grove.—You can reduce the range only by use of a lighter charge.

HIPPIAS, Boston, Mass.—The pistol book gives practical directions for the use of the arm; it is not historical.

K., Ward Hill.—1. The weight given is heavy enough for a ducking gun. 2. The new action is a very strong one.

J. T. C., Ohio.—Bozardus's "Field, Cover and Trap Shooting" is an excellent work, and adapted to your purpose.

K. Q., Haverhill, Mass.—1, Write to W. H. Pierce, Peekskill, N. Y. 2. We know nothing of the dogs mentioned. 3. No.

C. B., Eagle Point.—We do not know the name, which is probably a trademark, and can not pass an opinion on the gun.

F. A. S., New York.—We can give you no further information about the locality than that already printed in the item you refer to.

L. A. A.—The FOREST AND STREAM's grizzly bears are now in the Central Park menagerie, where you may inspect them at any time.

E. L. DE LA G., Brooklyn.—Can you give me the name of any house dealing in alligator skins? 2. Are there any duties on skins coming from Cuba? How are they generally shipped? Ans. 1. There are a number of houses in Spruce street and vicinity. 2. Yes. By schooner.

A. J. W. Pottsville, Pa.—Go to High Point, North Carolina, for quail and turkeys. Communicate with the proprietor of the Bellevue Hotel.

H. S., Salt Lake City.—You will find in Greener's "The Gun and Its Development" an account of the invention of the percussion system in firearms.

DICK SWIVELLER, Pittsburgh, Pa.—For description of Bermuda roads, send to Karl Kron, Washington Square, New York, for his "Coral Reefs of Bermuda."

F. M. T., Brockville.—For glass ball use No. 7 or 8 shot. For 12-gauge gun try 3drs. powder, 1oz. shot, and vary as your experiment ing may prove to be advantageous.

C. C., Philadelphia, Pa.—Government charts can be had of dealers in nautical instruments in all seaport towns. The prices range from 20 to 75 cents. Use boiled linseed oil and terebin for oiling canvas—1 gill of te rebin to 2 quarts of oil.

W. L. C., Pittsburgh, Pa.—Nassau is not an island but a town of New Providence, one of the Bahamas. The special information not to be found in your public library may probably be acquired by application to the U. S. Consul at Nassau.

M. H. S., Brooklyn, N. Y.—Make the sails of best sheeting muslin and the spars of spruce. The mainsail can be 11ft. foot; 7ft. 8in. luff, 9ft. head; 13ft. 7in. leech, 11ft. clew to throat, 16ft. tack to peak. mizzen in same proportion, 5ft. 3in. on foot, 4ft. 3in. on luff.

J. J. C., Burlington, Ia.—The narrower boat, 30x16, would be faster under oars. There would be little difference in the speed of the two models mentioned. We know of no rudder that houses in the stern of the boat. For copper nails and burrs send to A. Nelson, 195 Pearl street, N. Y.

C. S. A.—1. Chatham will be found a desirable point, or as desirable as any. The flight is altogether a matter of chance; you cannot be sure of getting any birds. 2. For notes on different guns see recent papers in the FOREST AND STREAM. A dozen different gun actions are plenty strong enough for you.

F. B. P.—The "Gazetteer" is in many respects out of date, but for the most part reliable, and the best comprehensive work of the kind. The Forester volumes so far published, do not contain the Sporting Scenes, but we believe the intention is to include everything, even to the novels and histories by which Herbert expected to be remembered.

C. V. D., Massachusetts.—The Maine law on ducks reads as follows: Section 21. No person shall kill or have in his possession, except alive, or expose for sale, any wood duck, dusky duck, commonly called black duck, or other sea duck, between the first day of May and the first day of September. Section. 22. No person shall at any time, or in any place with any trap, net, snare, device or contrivance, other than the usual method of sporting with fire arms, take any wild duck of any variety. But this section and the preceding shall not apply to the shooting of ducks on the sea coast.

NEW HAVEN, CONN.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

THE FOREST AND STREAM PUBLISHING COMPANY takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the eld of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, steering apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.

XLII. The Cutter Rajah.
XLIII. The Cutter Yolande.
XLIV. Yolande—Cabin and Deck Plans.
XLV. A Single-Hand Yawl.
XLVI. Single-Hand Yawl—Cabin and Deck Plans.
XLVII. S. H. Yawl—Rig and Construction.
XLVIII. The Cutter Mamie.
XLIX. The Mamie—Midship Section.
L. The Mamie—Sail Plan.
LI. Six-Beam Cutter.
LII. Six-Beam Cutter—Sail Plan.
LIII. The Cutter Surf.
LIV. The Cutter Surf—Sail Plan.
LV. The Cutter Surf—Midship Section
LVI. The Cutter Surf—Cabin Plans.
LVII. The Cutter Spankadillo.
LVIII. The Cutter Madge.
LIX. The Madge—Ironwork.
LX. The Schooner Gaetina.
LXI. The Nonpareil Sharpie.
LXII. The Cynthia.
LXIII. The Cruising Sneakbox.

A folio volume (size of page 14¼x12½ inches), printed on paper specially manufactured for it, and with great beauty of execution and finish in every detail, making a volume vastly superior to any other work of the kind ever published. Pages 370, with 136 plate pages additional, or a total of more than 500.

PRESS OPINIONS.

New York Times, Nov. 1.

The author, Mr. C. P. Kunhardt, is well known to all yachtsmen through his writings in behalf of better boats and a higher standard of skill while in charge of the yachting department of FOREST AND STREAM, and his hearty devotion to the sport, backed by a thorough scientific training, fit him peculiarly for the task he has so well accomplished. The conception of the work is a happy one; the subject is treated plainly and practically; fine spun theories and elaborated calculations are omitted, and only such results are given as will be useful to any intelligent yacht sailor or builder.

New York Evening Post, Oct. 24, 1885.

This book fills a blank in American yacht literature, and will be found a valuable addition to the libraries of our American yachtsmen. The subject matter, although covered in a measure by such works as Dixon Kemp's "Yacht Designing" and his "Yacht and Boat Sailing," is presented in more attractive form, is much condensed, and is procurable at less than half the cost of these volumes. It is practical throughout—practical in the treatment of what is popularly called theoretical. . . . We can recommend the book, notwithstanding its title, "Small Yachts," to all yachtsmen without reference to the size of their vessels, existing or in prospect.

Boston Herald, Oct. 4, 1885.

One of the best publications on small yachts that has came from the press for some years. . . . The volume as a whole commends itself to the yachtsmen or to the landsman who seek information on the subject of building, rigging, fitting out and sailing yachts.

American Canoeist, October, 1885.

To the man interested in boats—building, rig or sail—Kunhardt's book will be as interesting as a novel. It will not be read through once and then shelved, but will be kept in a convenient place for easy reference. It cannot get out of date.

New York Commercial Advertiser, Oct. 6, 1885.

This collection [the plates] is a concise history of yachting with small boats at the present time, and has a value which is not easily overestimated. . . . The many merits of the book will commend it to all who are interested in yachting and to all who want to be.

San Francisco News Letter, Dec. 5, 1885.

The largest, most complete and handsome volume upon small yachts that we have seen. . . . The whole scope of yachting is ably handled.

The Germantown Telegraph.

It is beautiful in workmanship, abundantly illustrated and proves itself on every page the work of a writer thoroughly conversant with and enthusiastic about his subject. . . . It is to those who love yachting for its own sake and are intent to be their own masters that this work will appeal most successfully, for it shows how to build and run a small yacht, which will give all the sport one wants and make a true sailor of its owner.

New York Herald, Dec. 12, 1885.

There is a growing tendency among those who delight in "a whiff of the briny" to own a small and staunch cruiser, and to sail either single-handed or with a nautical shipmate. To those whose fancy lies in that direction, but who have not yet achieved their ambition, we cannot conceive of a better book than this of Mr. Kunhardt. There are numerous large plates and designs of every kind of boat, which can be recommended as reliable. There are sail plans and rigging plans, and there are also many shrewd suggestions and hints which the old seadog as well as the young tyro may read with advantage. The Forest and Stream Publishing Company issue the book in a style which does them great credit.

Now Ready. Price, postpaid, $7.00.

Manufacturer of Cedar Decoy Ducks of all kinds. First quality, $9 per doz.; second quality, $7 per doz.; third quality, $5 per doz. Also Geese, Brant, Swan, Coot and Snipe Decoys. Duck and Turkey Calls. Decoys made like any pattern furnished without extra charge.

St. Clair Flats Pattern, much larger than the bird; less than one-third the weight of solid decoys. The exact position of a duck on water at rest and unalarmed. The lightest and best decoys made. Heads in different positions; glass eyes, hollow and flat bottom. Do not require weighting to keep them upright. Painted the exact imitation of the natural bird, $15 per doz. Sold by all gun dealers, to whom I give a large discount. If your dealer does not keep them I will send, freight paid, on receipt of price. Illustrated price list free. I also make solid decoys after the Monroe Marsh Pattern, semi-flat bottom; price $11 per doz.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in 1885 we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM'S constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This in the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table. We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

GOOD THINGS IN STORE FOR 1886.

Among the papers and sketches to appear are the following:

To the Walled-in Lakes.

Sketches of exploration and hunting in the Northwest with the Blackfeet and Kootenays. By "Yo."

Cruise of the Coot.

An account of a voyage alone in a single-hander from New York along the Atlantic seaboard to Florida. By C. P. KUNHARDT.

Hunting in the Himalayas.

Scenes and incidents in the life of an Indian forester. By "SHIKAREE."

Falcons and Falconry.

An introduction to the sport of hawking, with illustrations, drawn from nature. By R. W. SEISS.

Game Preserving in Britain.

A comprehensive series of papers on practical game preserving in Great Britain, with descriptions of the game birds of the British Islands, and sketches of sport. By "MOORMAN."

Scrimshawing.

A popular account of how a whaler spends the idle hours aboard ship. By JAS. TEMPLETON BROWN.

The Lower Forms of Life.

A continuation of the admirable series of essays on the beginning of animal life. By JAMES STOLLER.

Studies in Botany.

New chapters on plants and plant life, written and illustrated from nature. By A. W. ROBERTS.

Land and Water Experience in Florida.

New chapters of experience on the Gulf Coast. By "NESSMUK."

Cruise of the Pilgrim.

A delightful description of a summer voyaging on the Atlantic in the cutter yacht Pilgrim. By W. H. WINSLOW.

Days with the Barmacide Club.

A vivacious account of angling luck, good and bad, in Adirondack waters, whose name, latitude and longitude the author refuses to disclose. By MILLARD

Camps of the Kingfishers.

A further relation of what befel the Kingfishers in their sojourn at Carp Lake, Michigan.

Camp Flotsam.

A new series of the chronicles of the outers at Camp Flotsam, with accounts of bass fishing in Canadian waters. By WAWAYANDA.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

The Forest and Stream Publishing Co. will send post paid any book published on receipt of publisher's price.

THE ITHACA GUN!

BEST ENGLISH TWIST BARRELS, $35.

DAMASCUS STEEL BARRELS, $50 to $200.

BAKER'S

Latest and Best Invention.

Strongest, simplest and best balanced gun made. All have Top Lever, Low Hammers, Rebounding Locks, Interchangeable Parts, Extension Rib, Self-Fastening Compensating Fore End, Rubber Butt Plate, and the shooting qualities that made the Baker Gun a great success. Send for Circulars.

ITHACA GUN CO., Ithaca, N. Y.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.
LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.

STODDARD'S

Map of the Adirondacks.

The best and most complete map of the Adirondack region ever published.

PRICE, POSTPAID $1.00.

For sale by the Forest and Stream Pub. Co

PATENTS. 15 years' experience, 4 years in U. S. Patent office. Send model or sketch for free opinion as to patentability and new book on patents. Expert searches. Patent litigations. E. B. STOCKING, Attorney, opp. Patent Office, Washington, D. C.

Snow Shoes

Toboggans and Moccasins.

LARGEST DEALERS IN CANADA.

ANSWERS TO CORRESPONDENTS.

TO PROTECT EXOTIC SPECIES.

A FEW weeks since we suggested a plan for stocking the east end of Long Island with deer, a project which we regard as entirely feasible. It is evident that measures of this kind are necessary, if we are to continue to have any large game within easy reach of the great centers of the East.

It is apparent that our supply of native game must, as things are going at present, soon disappear. Two courses are open to us to check its rapid diminution. These are (1) a shortening of the open season and a proper enforcement of the laws, and (2) the restocking of suitable localities with game which is adapted to them.

Any shortening of the open season is violently opposed by many men, who call themselves sportsmen, but who are unwilling, for the general good, to give up any part of the pleasure which they take afield. They are so short-sighted that they cannot see the inevitable result of the present unfortunate methods in general practice, and so they continue to advocate the spring shooting of snipe and wildfowl, the summer shooting of woodcock, the water-killing of deer, and other like abominations. For a number of reasons, the attempts to enforce the laws are far less successful than could be wished. The laws themselves are often faulty. Many of the State officials appointed for the purpose fail to do their duty, and the ignorance and opposition of large classes, among which these officials have to work, is a serious bar to success.

The restocking of our covers has here and there been attempted in a desultory and spasmodic way by individuals. It has become quite a common practice to turn out quail in various localities, and what has been done in this way has resulted in very great benefit to certain shooting grounds. But to have any permanent value, such work should be undertaken on a far larger scale than has yet been attempted. In many localities here in the East large tracts of country are preserved by clubs, who post the lands which they own or hire, and employ men to look after the game. Often the grounds of several such clubs adjoin each other, so that two or three of these organizations may control a tract covering many square miles of territory. In such a case it is for the evident advantage of all that such bodies should unite in the work of restocking their lands, and should undertake it on so large a scale as to make the result of their efforts a certainty. Thus, in the case of Long Island clubs, quail, English partridges, pheasants, hares and (if a protective law shall be enacted) deer should be liberated. In New Jersey, quail, English partridges and pheasants will do well. The experiment with the English game birds has been so thoroughly tried in the last named State that its success appears no longer doubtful. It has been shown that they will thrive in that climate, but they should be protected so far as is possible from the attacks of vermin, and at first should have some fostering care.

In the Adirondacks the game supply, while abundant, is not varied. Hares, grouse and deer are the only important game species now found there, for the black bear and the cougar are not sufficiently abundant to afford sport. In old times two noble species—the moose and the elk—were found there, but the last moose was killed more than twenty years ago, and the elk is known there only by tradition and by the fact that now and then his decaying antlers are turned up by the plow. There is no reason why both these species might not again be made to inhabit their ancient home on the headwaters of the Hudson. The ownership of the land in the Adirondack region is such as to make the protection of specimens of large game turned out there very easy. Large tracts of lands are owned by corporations, many of whom employ, to look after their tracts of forest, men who might also guard the introduced species from danger until they had become established.

One thing is essential before any attempt at stocking can hope to be successful. Laws are needed and should be enacted by all the States for the protection of exotic species of game birds and animals. Such laws should provide penalties far more severe than those attaching to the laws for the protection of our native game. Such exotic species and their offspring should be regarded, for a time at least, as private property, and it should be as much an offense to attempt to capture, wound or kill them as to attempt to injure the farmer's turkeys or his cows or horses. Such a law is greatly needed at present, and it is to be hoped that there will be no difficulty in getting the Legislatures of some of the States to pass it.

CHANGING MILITARY ARMS.

THERE is, we understand, a very pretty scheme afoot looking to some changes in the small arms of the United States regulars and the New York State militia. We do not know how extensive the plan is nor how much of the $600,000 set apart by Congress for the militia it is proposed to consume in the little piece of legerdemain.

At present the New York State militia use the Remington .50-caliber gun as the official arm. It is not a desirable one, partly because it was turned off quickly and cheaply at the time of the contract for production, and partly because at this day, in military arms especially, a .50-caliber weapon is looked upon as too large a bore for accurate work at long ranges. With a picked and tried weapon at 500 yards the Remington State model does fairly well. Above that distance, nobody would try to hit anything.

The regular army weapon is the Springfield caliber .45, a very handy piece in many respects, but with a great trap-door breech, very unmechanical and antiquated when compared with some of the newer makes of rifles. There are now a number of magazine rifles distributed about the various army posts, and it is the general impression that the single loader "has got to go," and that the coming arm is to be a weapon capable of an instant change from a single loader to a magazine piece.

It would be a very nice plan indeed if all the small arms now in the hands of regulars could be gathered together, fettled up a bit and then distributed among the militia at a fair valuation. The regular army men could get hold of the Congressional fund, have a new make of long-range, magazine rifle put into the hands of the regulars and everything would be lovely.

In fact, a change is needed in the New York State arm; but let it be made in the direction of progress. The Remington breech action, for a single-loading military arm, is strong enough and simple enough to suit any critic. There are 20,000 of them in the hands of the militia and in State arsenals. Except in very few instances they are in good order, and it would be a very simple matter to fit a new barrel of smaller caliber, perhaps taking the government .45-85-500 cartridge, and in this way the uniformity of cartridge could be maintained between the regulars and militia, while the latter would not get one obsolete arm in exchange for another of the same sort. With a board appointed from the National Guard—a board of experts, not a board covered over with gold lace and incompetency—it would not take long to decide on a barrel, and for sixty or seventy-five thousand dollars the change could be made in every arm now owned by the State. This would be the sensible way Whether it is the plan which General Farnsworth will follow remains to be seen. With a shorter barrel, having more metal in it than the present one, a steadier shooting weapon would result; one which the men could take back to long ranges and use in effective target work.

The Inspector-General of Rifle Practice of this State could readily inform himself touching the tendency of that Springfield breech action to "stick" and get out of order. At the recent fall meeting at Creedmoor with picked men from among the Engineer Corps, there was constant complaint about the manner in which the Springfield did not do its work. In this regard the Remington is now far ahead of the Regular weapon, and it would seem like inviting trouble to take a lot of old Springfields for the Remingtons we now have

If there are any rifles to be sent to the junk heap to appear again bored out as cheap shotguns, let the Springfield go, and for a while, at least, or until something better than the U. S. A. gun is offered, our men will manage to worry along with the amended "gas pipe."

A REJECTED HOLIDAY GIFT.—Our esteemed contemporary, the New York *Herald*, has been sedulously striving for a fortnight past to work up a mad dog scare in New York. A hydrophobia panic was the sort of a Christmas gift it proffered to New York. The proffered gift has been rejected; the public has not gone wild over the terrible condition of things pictured in the *Herald's* columns; and the only substantial benefits accruing to anybody have been the columns of free advertising given the more or less sapient doctors who have paraded their hydrophobia lore in long-winded interviews. No one appears to have been able to say anything too utterly senseless on this topic for the newspaper to print. If an editor or any other individual should stand on the street corner and raise the cry of mad dog, he would probably excite a commotion, though there might be no mad dog this side of Konstontinogorsk; but columns and pages of a newspaper given up to a false alarm will fall flat. Now it's time to give the mad dogs a rest.

THE YELLOWSTONE NATIONAL PARK.—In his annual report, the Secretary of the Interior recommends for the Yellowstone National Park an increased appropriation, the appointment of five additional superintendents, and the establishment of a court within the Park with exclusive jurisdiction over all misdemeanors. These recommendations, we do not need to say, are just and sensible, and show that Secretary Lamar appreciates the needs of the reservation. Now that the needs of the Park are understood at Washington, we shall, with increased confidence of ultimate success, urge the speedy revision of legislation and the adoption of better means for the right care of the people's pleasure ground.

THE FOREST AND STREAM'S GRIZZLIES are now on exhibition at the menagerie in Central Park, where they welcome visitors with the courtly grace of an older bear when he meets a tenderfoot in the down-timber. We have had several applications for the cubs; one from an animal tamer who wants to train the grizzlies for the stage. For the present the bears will remain at the Park. What the ultimate disposition of the bears will be has not yet been decided; it is something about which FOREST AND STREAM will gladly take counsel of its friends.

WHY SHOULD THEY INTEREST THEMSELVES?—A late issue of the Albany *Journal*—the paper once edited by George Dawson—says that the Eastern New York Anglers' Association wishes to hear from "sporting men" about the fish laws. Why should the Angler's Association care to hear from "sporting men," and for what reason should "sporting men" interest themselves in the fish laws? A correspondent suggests that the *Journal* may have meant "sportsmen," and this is probably the truth.

A MERRY CHRISTMAS IS THE FOREST AND STREAM'S GREETING to its thousands of readers; and may each, whether shut in by Northern snow drifts or enjoying the genial glow of the Southern sunlight, find in this number something to add to the enjoyment of the season.

OUR READERS *will confer a favor by sending us the names of such of their friends as are not now among the subscriber of the* FOREST AND STREAM, *but who would presumably interested in the paper.*

TO THE WALLED-IN LAKES.

III.—ON A MOUNTAIN SIDE.

THE next morning, though the sky was still dark and lowering, I started with Yellowfish to climb a mountain and secure, if possible, a little meat for the camp. Birds were plenty, and there were fish in the lake; but we all felt a little longing for some good, fat sheep meat, and we were going to the mountains where the Indian had said that the sheep were so plenty that if we tried not to see them we could not help doing so. A heavy mist, which now and then lifted for a few moments and gave us brief glimpses of the black peaks beyond, still hid the tops of the mountains; but we hoped that as the sun rose higher the skies might brighten.

We took a trail leading to the head of the lower lake, crossed the inlet, which was up to our horses' bellies at the ford, and began to climb the hills on the west side of the upper lake. These hills, though smooth, are quite steep, and are for the most part covered with a thick growth of small aspens. A trail had been cut through these by a party of Piegans, who had been hunting here a year before, and the ascent for the first two or three miles was not very difficult. Every now and then we would ride out into a little open park, in one or two of which we saw fresh elk tracks, and as we mounted higher the aspens gave way gradually to spruces and then to pines. The climbing became more and more difficult for the horses, and at last we reached the top of a high hog back, above which the bare rocks rose in an ascent too steep for our animals to surmount. Leaving them here, we continued on our way through the snow on foot.

It was a rough and difficult climb up a slope so steep that often it was necessary to scramble along on all fours, and at first over smooth grass, made doubly slippery by the snow which covered it. Then came the rocks, which in past ages had tumbled down from the top of the mountain, and over these our progress, though quite as slow, was less difficult because we had a more secure foothold. Half way up this steep slope a few stunted pines grew among the ragged rock fragments, and through their snow-laden branches we forced our way. The top of the slope reached, we had left all vegetation. Before us nothing was to be seen but a wide expanse of gray rock and white snow which ran up to a vertical cliff, whose top was hidden in the dense mist. The clouds had all the morning hung about the mountain tops, and we were now fairly among them. It was impossible to see more than fifty or sixty feet in any direction, and hunting was out of the question. Any game that was not moving rapidly would be sure to see us before we saw it. We kept on climbing for a while longer, until the mist became so thick that it was useless to go further, and then halted and waited for it to clear away. Suddenly we heard a rattling among the rocks as of a stone rolling down the slope from a great height, and strained our eyes to see if we could detect through the mist any moving object, but it was of no use. Then Yellowfish and I looked at each other and nodded sagely and triumphantly, as who should say "there are sheep there." A little later the noise was repeated, and we felt confident that it was caused by sheep above us setting in motion the loose stones. Through the dense fog we crept a few hundred yards higher up on the mountain, but as nothing could be seen, stopped again under the lee of a huge boulder many tons in weight. Beneath this was a narrow level space two or three feet wide and twenty long, where the sheep had stamped out beds for themselves. A keen wind was blowing and with the drenching fog had by this time made us both very cold. Yellowfish's toes were sticking out of his torn moccasins and I was wet up to my knees. The cold damp mist penetrated to one's very marrow. We spent an hour or two by this boulder, tramping up and down and beating our arms against our sides in fruitless efforts to keep warm.

At length, seemingly disgusted, the Indian said, "Let's go home." I made an assenting gesture and he led the way down the slope. Just before we reached the top of the steep slope on which the pines grew, there came a fierce puff of wind, the fog below us disappeared, and gradually the beautiful lakes with their immediate surroundings were revealed. Slowly the curtain which hid the mountain sides was lifted and in half an hour those on the west side of the lower lake were free from clouds. About the tops of the higher peaks beyond the upper lake little mist clouds still hung, clasping them in a close embrace, as though unwilling to be torn from them.

At our feet lay the two lakes, the whole length of the lower and half the upper one being exposed to view. The scenery of the latter is much the bolder of the two. The slope of the mountains from its lower shores is at first gradual, but a little back from the lake they lift themselves in sharp timbered acclivities. About five miles from its outlet, however, the mountains close together so as almost to meet, and the lake lies in a gorge between them, the rocks being nearly vertical on either side. It looks as though a narrow and deep channel had been cut through the top of the mountain range for the deep, dark waters to pass through. On the east the rock faces are dark gray and bare of timber, but on the west a timbered point of the mountain runs down nearly to the lake's edge, where it breaks off into a precipice two or three hundred feet in height. Here the shores dip down so steeply that a few feet from them it is almost impossible to find bottom. Beyond this point the lake grows wider again, and here for some miles it is bounded by bare, rugged mountains, snow-capped and seamed on their sides with ravines, in which are great drifts, sparkling and white near the summits, but gray and nearly dust-covered toward the water's edge. On the east side of the lake a dozen mountains, separated by deep gorges, stand boldly out over the water, and in one of these lies a vast mass of ice, several hundred feet in thickness and reaching far back upon the mountains. What its length and width no one yet knows, for its northern and southern ends are hidden from view by the mountains on either hand, and it is far above the observer, but the dark green face of the ice cliff several hundred feet in thickness conveys some idea of its tremendous mass.

Something of all this we saw as we sat upon the mountain side and watched the fog clear away. Down in the little bay where lay our camp we could see the white glimmer of the tent, and on the ridges beyond it were tiny dark dots which we took to be the horses.

I was enchanted by the beauty of the scene, and was slow to respond to my companion's remark, "Fog all gone; let's go back," and rather reluctantly rose from my seat and followed him up the steep ascent. Back we went, clambering over the rough slope until we were nearly at the foot of the great cliff which overshadowed it. We made our way slowly around the north point of the mountain, and into the black cañon which separates it from the one next to the northward, facing the bitter wind which now and then brought with it a blinding snow squall. Often from the rocks at our feet came the bleating cry of the little chief hare, curiously like the squeak of a penny trumpet, and the soft whistling twitter of the gray-crowned finches made cheerful music, little in keeping with the desolation that surrounded us. A ptarmigan walked out of our way as we advanced toward it, and once as I was sitting alone for a few moments on a rock, a martin, resplendent in his glossy brown coat and whisking his black-tipped tail, ran close by without perceiving me.

The long and arduous climb was made in vain. We saw no sheep, and at length turned our faces down the mountain side and reached the horses. On our way to camp we saw two or three ruffed grouse, a fresh elk track and a good-sized bear track made since our passage earlier in the day. Just before dark we reach camp, wet, tired and hungry.

The next day the whole camp turned out at an early hour, and, catching up the horses, made preparations for another hunt. We were all to go, and only the two little dogs would be left behind to keep camp.

The route followed was the same which we had taken the day before, but the prospects for success in finding game seemed somewhat brighter, because the day was much warmer and more pleasant. We rode across the inlet under a bright sun, though we could now and then see the mist clouds hurrying along high up on the mountain to which we were bound, and sometimes its outlines were obliterated by a snowstorm.

We rode across the inlet flat and climbed the ridges, now passing through dense thickets of low aspens and then out into pleasant parks, and through dark forests of spruces, always climbing higher and higher, until at length the hog-back was reached, where we must begin to climb on foot. Here we dismounted, unsaddled and tied up the horses.

New snow had fallen since the day before, and we could see a quarter of a mile away, on another hogback, a well-defined trail where a number of large animals had passed up or down. Yellowfish pointed to this evidence of the presence of game with an air of great satisfaction, and we set out on our climb.

The life of a sheep hunter is not one of luxurious ease. He must breast the steepest ascents, and must seek for his game over ridges, along precipices and up peaks, and follow it to its home among the clouds. Sometimes he can do this by means of a trail made by the sheep themselves, and he is fortunate if he finds such a path to the heights. More often he has to clamber laboriously over rough beds of jagged rock, along the faces of steep slopes, where a misstep would send him rolling down hundreds of feet on to the sharp rocks below; or over beds of sliding shale that yield and slip under the foot, often carrying him with them as the unstable mass is disturbed by his weight; or along narrow ledges where the vertical rock above and at the side offers no hand hold, and the abyss beneath, if considered, would shake the steadiest nerve. Worst of all are the steep faces of slippery clays sometimes encountered, where every muscle must be brought into play to keep feet and hands in position. When, as is frequently the case, the mountains are covered with snow and ice, the difficulties of climbing are of course much increased. The sheep hunter must have good lungs, tough muscles, a clear head and an iron nerve if he wishes to be successful in this difficult pursuit. Sheep hunting is no boy's play, and in these mountains it calls forth all a man's physical powers. There are—or rather there used to be—localities where it was possible to get these animals without such an expenditure of energy, but from most such places the sheep have long ago disappeared. Nowadays the man who kills a sheep usually earns it several times over before he gets the meat to camp.

Clambering up the rough mountain side just where we had gone the day before, we turned off to the left instead of to the right and followed along under the inaccessible cliff. The climbing here was slow and difficult. The talus was composed of cubical blocks, from one to four feet in diameter, with sharp edges and corners, and these were lying tumbled about confusedly over the whole mountain side. It was necessary to step from one to another of these snow-covered masses, and often the stones were so nicely balanced that a man's weight would cause them to tip and turn, and the result would be an ugly fall on the sharp stones. Each one of us got two or three tumbles during the day from this cause, and I think we all of us made up our minds that it was an extremely uncomfortable place in which to fall down.

The rocks passed, we had for awhile easier walking along a sheep trail which led us over some quite firm shale.

We had not proceeded very far before we came upon the track of a sheep made the day before in the snow, and Yellowfish pointed it out to me with the remark, "Maybe the rocks don't fall down for nothing." Now tracks were all very well, but we could neither fry nor roast them, and so they were not altogether satisfactory. Moreover the mountain side where we were, while it was a capital lying ground for sheep, was absolutely destitute of vegetation and so was not a feeding ground. The best place to look for game I have always found to be its feeding ground, and I was anxious to get to this. Here the only places where feed could be had was down on the hogbacks where the ridges came up to meet the slope of broken rock fragments, or else on top of the cliffs, at whose feet we then were. Moreover I had several times that morning heard the noise supposed to have been made by rolling rocks repeated, and had at length satisfied myself as to its cause. The day was clear and there was no mist in the air, so that we could see the whole face of the cliff above. At short intervals along this rocky face small springs broke out and trickled down it, and their waters, frozen during the preceding night, hung down in long icicles. The morning was warm, and as the ice melted, one of these icicles would every now and then break off, fall down some distance and clatter over the rocks with a sound very much like that which would be made by a stone rolling down the same slope. Now that the air was clear, one could distinguish, however, that the sound made was not exactly that which would be made by a rolling stone, that it was sharper and crisper and not so dull.

During our passage along the mountain side we crossed a number of different strata. There was no straight up and down climbing, but a great deal of slow creeping and scrambling along places which, though not dangerous, were sufficiently bad to promise a good deal of discomfort if one got fairly started down the slope. Two or three times we had to cross beds of fine shale fifty or sixty yards in width. This shale was piled up just as steep as it would lie, and the addition of a little weight or the removal of a few fragments would start a portion of the bed to sliding down the slope. Now and then points of the firm underlying rock projected through the unstable bed, and we had to get from one such point to another as rapidly as possible. So one by one we would stride along through the moving shale, then rest a little and pass on to another island of rock, and at length reach what was really *terra firma* on the other side of the slide. As we crossed the moving mass we, of course, went down the slope with it and would thus lose forty or fifty yards in vertical distance in making the passage. These slides, though laborious, were not so unpleasant to pass over as some of the smooth dirt or clay slopes. These are often extremely steep and very slippery, so that it required the utmost care, on the one hand not to lose one's balance and fall, and on the other not to have one's footing give way and slide. In either case the result would have been the same—an exceedingly rapid journey over the greasy clay for two or three hundred feet and then an abrupt halt on the rocks below.

Over such ground we made our way for five or six hours, rounding the southern point of the mountain, but seeing no sheep. Sign was abundant enough, and some of it quite fresh, but all the indications, it seemed clear to me, pointed to the conclusion that this side of the mountain was the winter range of the sheep, and that until severe weather came on they must be looked for either on top or on the northern slope of the mountain. On inquiry of Yellowfish, who professed to have killed a number of sheep the year before, just where we were now hunting, I found that it had been late in November that he had done it, but before any heavy snows had fallen. Turning back toward the horses we retraced our steps, going along the mountain nearer its base—a most unwise proceeding, for it obliged us to climb ridge after ridge. Before we had got down to the timber we stopped to rest for a few moments, and the Indian, having nothing better to do, shot at a little chief hare among some boulders below us. Immediately after the shot, we heard, a couple of hundred yards below us in the timber, the characteristic cracking of sticks that told us that some elk were afoot. They did not show themselves, and gradually the sound of their movements was heard more and more faintly, until at length it was wholly lost.

We kept on our way, and at length, after a most discouraging walk over slippery, grass-covered hills and through some very bad down timber, we reached the horses. I was glad enough after saddling up to clamber on to old Jerry and ride him down, even over the worst and steepest parts of the trail.

Yo.

TOBOGGANING AND SNOW-SHOEING, borrowed from Canada, are growing in popularity as winter sports in this country.

For Christmas Week.

"SHIFTLESS BILL."

A Christmas Sketch.

I.

WHEN I first met him I was a boy of about fifteen and he was perhaps a year or so older. I had landed my little duck boat where a seine was drying on a marshy shore, and with infinite difficulty I made my way through the coarse marsh grass, sticking fast in the soft muck at almost every step, to a tumble-down log hut back from the river. I had come out, as was my wont when a schoolboy, on a Friday afternoon to spend the night and the Saturday holiday on the sluggish, muddy river that crawled through the swamps and marshes eight miles from my home. Usually I passed the Friday night curled up on the dried grass in the bottom of the little duck boat, with a big overcoat for a covering, but on the day I first met Shiftless Bill it had set in to rain steadily, and as I had no tent and no rubber coat, I ventured to seek a shelter for the night in the only house in sight at dusk, the tumble-down log hut aforesaid.

When I knocked a timid knock on the door, an old, hard-visaged woman and an older, harder-visaged man both peered out at me in a forbidding sort of a way. Could I stay all night? No, they didn't take lodgers. But I would pay, and wanted only shelter and a place to spread my overcoat for a couch. They had no bed, but—would I sleep on the floor? Certainly. Well (after a whispered consultation), then I could come in.

The interior was dark, ill-smelling and otherwise forbidding. There were two flag-bottomed chairs, guiltless of backs or arms, and a home-made deal table. At one side was a curtain of faded calico, which probably concealed some sort of a couch, and in the furthermost corner of the room was a black heap of rags or clothing, which of the two I could not tell in the darkness. Even when the home-made tallow dip was lighted and placed upon the greasy table in a split piece of green wood which served as a candle stick, the light it furnished was faint and dismal, and only made the dark crannies of the room darker yet.

"Come f'm town?" asked the old man.

"Yes, sir."

"Got sot lines* in the river?"

"No, sir; I'm just out for a paddle down to Egypt. I shall go back to town to-morrow night."

"Humph! Eat supper?"

"Yes, sir. My lunch is in the rubber bag."

The old man then relapsed into silence, lighted a pipe and drew toward him a bundle of dried flag, which he proceeded to plait into the shape of a corn basket, while his better half also lighted a pipe and devoted herself to the task of washing up the cracked and yellow earthen dishes which had done duty for a recent meal, using a greasy butter tub in lieu of dishpan. As for myself, I felt the uncomfortable knowledge that I was an intruder, and an unwelcome one at that, and inwardly vowed that never again, so long as I cruised on that river, would I be found afloat without a rubber blanket or some shelter from rain that would make me independent of the natives of the marsh lands.

An hour passed, and the man still plaited and smoked, and anon spat, with great force and unerring precision, through a chink between the log walls of the cabin where the mud had fallen out, but never a word said he. The old woman finished her dish washing, lighted one fresh pipe and then another, and busied herself glueing a patch on the toe of a rubber boot, but she was as dumb as her spouse. Another hour passed, similar in all respects to the first, and then I nodded on my chair, recovered suddenly and coughed, then nodded again and fell fast asleep. When I awoke, the old woman had vanished, and the old man was standing over me in red flannel shirt and home-knit socks.

"Blow out the light," he said, "when ye've rigged yerself fer bed." After which terse command, he drew the faded curtain aside and disappeared behind its folds. In five minutes a profound bass snore, with the accompaniment of an asthmatic, intermittent gasp, told me that my host and hostess were wrapped in slumber.

I spread my huge overcoat on the cleanest spot on the floor, moved the candle to the edge of the table, where I could reach it from my couch, and proceeded quietly to wrap myself in the generous folds of my improvised coverlet and couch combined. As I lifted my hand with a yawn to reach the candle in order to extinguish it, I thought I saw some slight motion in the heap of rags in the dark corner of the room. I held the candle above my head and peered into the dim recess, but saw no further move, and believing my eyes to have deceived me, was about to blow out the light when the heap of rags began to rise slowly toward the ceiling. Cold shivers chased each other up and down my back and the roots of my hair tingled. As the heap finally assumed the shape of an upright being and advanced toward me my fright increased, and my terror was so intense that I lay there motionless, the candle still grasped in my left hand, unable to move. I say an upright being because at first there hardly appeared to be anything human about the object. As it came into the arc of light which my candle threw about me, however, I made out that it was the figure of a man or boy, tall, long-armed and brawny, with a great pumpkin-like head covered with a thick tangled mass of yellow hair and two big, dull, vacant eyes, staring out from a face dirty, blotched and several shades darker than the hair. The clothes were few, scant in their fit and hanging in tatters. As I recovered in a measure from my fright and was about to speak, the boy raised a hand like a ham in warning gesture and whispered a low "Sh-sh!" Then he sat on a chair close by me, pulled from somewhere in the interior of his rags a dirty, torn volume of Goldsmith's "Natural History," turned the leaves awkwardly until he came to a wood cut of a giraffe, and holding it in front of my eyes he whispered: "Is there sech hosses livin' es that air?"

I nodded my head in assent, and he looked at the cut musingly for a moment, then returned the book slowly to the mysterious depths of his rags, and whispered with a smile. "They must be dod-durned good uns fer ploughin'."

I again nodded assent, and having now completely recovered from my fright, I ventured a whispered "Who are you?" The boy looked cautiously around toward the curtains, from behind which the bass snore and the asthmatic gasp were still audible. Then he looked at me intently for a moment, then jerked his thumb over his shoulder to indicate the sleepers, and said, "Them's my pap an' mam. I'm Bill. Folks gen'rally call me Shiftless Bill. Dad says I ain't right here," tapping his forehead with a grimy forefinger, "and neighbors say it's Dad's fault. When I was little Dad bet Joe Lynch he could split a green mushmelon on my head with his hand open—so. It was hard work, but Dad won, with four tries. They say I hain't ben right sence," and the boy gave a low chuckle and seemed vastly amused. Then he leaned further forward and whispered lower, "They didn't know I was under them carpet rags to-night. Ef they had Dad 'd ha' wolloped me. He allus wallops me. I don't live home now, I live—outside," with a wave of his hand to indicate the outer world generally. "I come here after powder an' caps while they was berryin', an' got ketched inside." Then he rose, walked as still as a cat to a cupboard, poured a small quantity of powder from a horn into his hand and from thence into a little cloth bag he carried; then picked out of a box not more than a half dozen G. D. caps, which he disposed of somewhere beneath his rags; then closed the cupboard door carefully, stole with the same cat-like tread to the cabin door, which he opened softly and with a farewell smile of absolute vacancy to me, the door closed noiselessly behind him and he was gone.

I blew out the candle and tried to sleep; but in vain. I could think of nothing but the vacant smile, the dark, blotched face, the frowsy, yellow hair, and the tattered garments of Shiftless Bill. At last, after tossing and turning for two or three hours, I found that the rain had ceased, and rather than lie on that cabin floor for the rest of a sleepless night I rose, stole out of the hut and down to the river, turned the duck boat up to let the water run out, and then paddled away in the darkness until I had put two good miles between me and the log cabin. Then, tired with my exertion and the lack of sleep, I pushed the boat half its length upon a muddy point, laid my arm upon the stern deck and my head upon my arm, and sank to sleep.

II.

It was a long time—rather more than three years—before I had another interview with Shiftless Bill. I had gone as usual for cruises on the river in the summer time; but the great, brawny form of the half-witted lad had never come under my notice, and I somehow began to look upon my first vision of him as a sort of dream, a nightmare which left more than the usual impression upon me. One warm day I heard the sweetest bird music that I had ever listened to coming from a willow copse close by the river. I landed my boat upon the grassy bank, stole to the edge of the thicket, and looked through into an opening beyond where the sun streamed in. There, in the midst of the sunshine, lying flat upon his back, listening with an entranced look in his eyes to the song of the bird, was Shiftless Bill, grown larger than before, more ragged than ever, dirtier in every way, and with lines of care or suffering drawn upon his face, but the same Shiftless Bill whom I had met so strangely in the log cabin three years before. A slight movement upon my part and a snapped twig brought him to his feet in an instant. Then he recognized me with the old vacant smile, picked up an old musket, the barrel of which was red with rust, and stepped out upon the grassy bank by my boat and me, where he sat himself down, dived into the recesses of his rags, pulled out the Goldsmith's "Natural History," thumbed the dirty leaves until he came to the cut of the giraffe, and then handed me the book, saying, "I've been a lookin' fer ye. That readin' tells about that air hoss. A girl read it to me wunst, but I want to hear it agin. Kin you read it?"

I told Bill I could, and proceeded slowly to read the paragraph of about a dozen lines that described the "giraffe or cameleopard." "Read it wunst more," said Bill when I had finished. I read it slowly again, Bill following my words with his lips with closest attention. When I laid the book down what was my surprise to hear this uneducated, half witted monster reel off with perfect precision and without hesitation, the paragraph I had just finished, word for word, I believe. Then he grinned his vacant smile, and put the book away.

I was becoming much interested in this strange being, and attempted a conversation with him. Where did he live? Live? Wherever he liked. Everywhere. In fact, if I wanted to know, he lived nowhere. Did he work? Work? Well, yes, sometimes, when he wanted money. What did he do with all the money he earned, if it were not impertinent to ask? "*All* on it?" He looked as if I was poking fun at him, then chuckled and shook his filthy rags in a paroxysm of mirth. Save it? Lord, no; he was no miser. Work was a disagreeable necessity sometimes, or sometimes a relief to the monotony of doing nothing. Work might provide him with an old pair of boots when it was too cold to go barefooted, or a discarded horse blanket for his winter wardrobe, but there was no actual need of continuous work for any length of time. Where did he get his meals? Humph! he never had no *meals*. Yittles didn't trouble him much. He mostly found "suthin' ter eat" when he was hungry. Raw turnips dug out of a field, sometimes raw potatoes, or corn, or "tommatuses," or melons, or apples, or berries, or "sassafrax" root, were generally, one or the other, near at hand when he felt a desire to eat, but in winter he lived on bread, and then he had to do chores to get it. Didn't he ever eat meat? No, he hadn't touched pork, not since Dad had kicked him out, long ago. For the rest, he was contented with his lot; he knew where to find what he wanted when he wanted it; nobody meddled with him, and he meddled with nobody. The soft leaves in the hollow made by an uprooted tree were a good enough bed in summer, for rain he didn't care a rap, and when winter and cold a haystack or the straw in a barn was comfortable to bury himself in, and if they weren't handy, why, a pig pen always was and the pigs knew him well and rather liked his company than otherwise. Wasn't he ever cold? Cold? He didn't know what cold was. And sick? What business had he with being sick? In his opinion it was only them that drank rum, used tobacco, ate too much, or lived stuffed up in houses that was took sick. He never did none of them things, and did he look sick? I was safe to say that he didn't.

Shiftless Bill's life, as I learned then and afterward from those who knew him, was singularly inoffensive. He was never known to be dishonest; never foul-mouthed; he had no bad appetites. When he was sometimes compelled to labor to obtain certain necessities he could accomplish with his wonderful strength more at the scythe, with the axe or the spade than any two men. He never took money for his services, asking for some discarded article of wearing apparel or a loaf of bread instead; and the only objection his acquaintances could urge against him was that he was extraordinarily dirty and unkempt, and therefore unpleasant as a companion to work with. Some complained that he had no pleasure in society and was entirely wrapped up in himself and his filth, with not a tender chord in his heartstrings for any other living being.

III.

In that last complaint they wronged Shiftless Bill. He had pleasure in society—a certain very interesting society. With his friends, the chipmunks, and the squirrels, and the weasels, and the rabbits, and the foxes, he was perfectly *en rapport*. He would lie on his back for hours listening to the varied and beautiful notes which the catbird, notwithstanding a general impression to the contrary, can pour forth in delicious melody; and the partridge wooed his mate and drummed the love-beat on the hollow log in complete disregard of the fact that Shiftless Bill lay watching the occurrence in plain sight underneath a sumach. And Bill had, too, a tender sympathy in his soul for certain beings, to wit, vagrant dogs; and the harder their lot and the more evident their kicks and abuse, the stronger was the force of compassion he felt for them; and many the poor wounded cur had Bill kept and tended, and nursed back to health and strength in his retreat in the leafy chestnut woods.

* * * * * * *

Do you remember that peculiar winter of 1877, when great tons of snow fell early in December, and on the 20th, five days before Christmas, do you recollect how the south wind blew warm and all the great mass of snow and ice began to melt and rivers rose, and the only thing that saved the country from disastrous freshets was a sudden freeze on Christmas morning, when the thermometer went down with a skurry? Well, that freezing Christmas after the four days' thaw is the day I write of. The river near which Shiftless Bill kept his nomadic domicile rose rapidly, as did all the other rivers during the thaw, broke its ice and went thrashing along over its usually quiet course, carrying barrels and boxes, hencoops and fences, logs and driftwood of all kinds along with it; and on that cold Christmas morning the inhabitants of the little hamlet of Egypt were gathered in the meeting house, not only celebrating the birth of the Christ-child, but giving prayerful thanks that the good Lord had sent the freezing temperature at just the right time to prevent the further increase of the flood, which was already spreading over the flat meadow on which the hamlet was built, and which in another day of thawing weather would have carried away half the poor little dwellings of the villagers.

As the congregation filed out of the little chapel and drew their mufflers and "tippets" tighter around them as the nipping frosty air bit their noses and ears, a shout from some boys on the river bank drew their attention, and men and women both hurried toward the youngsters, who seemed stricken with intense excitement. As they came nearer to the river the people saw what had aroused the interest of the children. Just opposite the hamlet a small raft, probably a barn door, was careering downstream, and on this, running back and forth from one side to the other in an attempt to find a place to escape, was a large, powerful, noble looking Newfoundland dog. Just below the village a point jutted out into the stream, and some of the ice and debris brought down with the flood had caught on this point and made a wall at the edge of the shore some ten feet in height, the force of the current having carried many huge blocks of ice away up on the land. As the raft bearing the dog was swept in toward this icy barrier the intelligent animal stepped to the edge nearest the shore, and crouched as if for a spring. Would he leap into the water and try to swim to the point? A sudden shout from the spectators went up as the dog was seen to spring into the icy water and strike out for the shore. For a few moments only his black head could be seen as he struggled nobly to gain the land. At last he reached the wall of icy blocks which rose in an inclined mass of large broken cakes for ten feet above the water. If he could climb over this barrier he would be safe. The noble brute was seen to lift himself in the water and put his fore paws upon one of the cakes of ice He drew himself up a little, then his paws slipped on the glassy surface, and he fell back into the water. Again he tried it, and again; and each time with the same result. Then he swam along the wall to another place, tried there, and failed. The spectators on the bank had run down nearly to the point, and were watching the dog with intense interest. Suddenly a loud cry arose. Close in to the village shore, tearing along with the current at a mad rate of speed, was a huge mass of ice, larger than any one body that had gone down before. Its front was piled up high, its edges were rough and jagged, its present course would crash it against the wall at the point and crush the poor dog into a pulp with its force. On went the mass, and still the dog struggled in vain. There might be yet time for some agile man to climb out on that slippery wall and draw the animal up out of danger. Who would make the attempt? Oh, it would be a dangerous, mad journey out along that wall of uneven ice for a man to take, and after all, it was only a dog that was to be saved. On, on, rushed the great mass of ice; nearer, every instant nearer to the poor brute, whose struggles seemed to increase tenfold in the desperation of the danger which he seemed to realize. Suddenly a woman shrieked, and pointed with her uplifted arm. The crowd looked, and a shout louder than any heard yet arose from their throats. There, on the bluff at the head of the point, a strange, uncouth figure of gigantic hight, enveloped in fluttering rags, with long, matted yellow hair flying in the wind, was tearing with great rapid strides down the declivity toward the struggling animal. For a moment he was out of sight and then he was seen again as he mounted the wall of ice to its crest from the other side. The mass was now almost upon the dog, which had ceased its struggles and was looking upward piteously at the strange figure. He must hurry if he would save the brute. He makes his way with difficulty along the uneven, glassy cakes of ice, clinging with hands and feet for a safe support. Ah! he has slipped! But one hand has held with a giant's strength, and he hastens along. He has slipped again, and again caught with his hands. Then with two quick motions, he frees his feet from the ill-fitting boots that encumber them, and then, barefooted, he bounds like a chamois from cake to cake and crag to crag, with a daring and an agility that make the spectators hold their breath with excitement. Now he is directly over the dog, and descends the almost perpendicular plane of solid ice more slowly. He is not a moment too soon, as the floating mass is within a few feet of the animal. He reaches out one long arm to the dog, says something in a sharp tone, and the brute in obedience makes one last effort to lift itself toward the saving hand. Alas! it has not the strength! The mass of floating ice is now almost upon them, and in another instant will crash into the wall with the force of a battering ram. "Go back! Go back!" the people shout. He will not. See! he

*"Sot lines"—lines set at night across the river, baited at frequent intervals with worms, for catching catfish. A common night's amusement there for the boys of the town.

s descending lower! He has now no foothold, but with his right hand grasps a small projecting ledge. His left hand he reaches down, and entwines his fingers in the shaggy coat of the animal's neck. He surely has not the strength to raise the huge dog in that position! Muscles of iron could not stand the tension! Ah, but he has muscles of better stuff than iron then, for he lifts the great brute, and draws it, wet and dripping, out of the water. Horror! the ledge has given way under the weight, dog and man have fallen into the icy water, and with a crash like loud thunder the great floating mass of ice hurls itself against the frozen wall and breaks into a million pieces!

Women shrieked and fainted, and men ran for axes and bars, and hurried out on the point. They climbed over the battered remnants of the wall, and worked with a will to pry and cut away the ice which held the bodies of the dog and man. For hours they worked and would not give up, but it was not until nearly dusk of that Christmas day that their labors were rewarded—rewarded by finding the two corpses, one the brute, and one not far removed from the brute, kind in his mode of life, but human and noble in the great unselfish heart that could meet death in the attempt to save one of the dumb kind which had been his only friends in life, the only kind whose ways he understood, and the only kind which understood and loved him.

They buried the man in the chestnut woods, and left no stone and no sign but a mound that is now mossy and green to indicate the spot where lie the remains of poor half-witted "Shiftless Bill." SENECA.

MAROONED ON RONCADOR.

WE were very much puzzled by the rather peculiar name given on our chart to a little sand cay well fringed with reefs, lying in latitude 13° 35′ N., and longitude 80° 6′ W., right in the fairway for a ship bound from Aspinwall to Key West, and 250 miles from the former. Our interest in the name arose from the fact that on our way north, instead of adopting our usual custom in such matters and giving it as wide a berth as we could without running too near to some other of its nature, we were called upon to go to it.

Our Spanish expert hunted up that the name Roncador meant "The Snorter," for it came from the verb ronca, to snore or snort, and when we got there we could see the reason of the nomenclature. Given a strong blow or even a moderate trade winds it would seem very likely, judging by the effect in breaker producing of the light wind we had, that it would prove indeed a "snorter." There is like significance in Spanish names of many of the dangerous reefs with which the Caribbean Sea is well provided. Mira-por-vis (look out for yourself), Quita Sueño (sleep stopper) and others, are well named.

Our mission, when we left Aspinwall early on Nov. 19, was one of humanity, and we were well pleased. Had it been exactly the opposite we would have been pleased, but perhaps not so much. But the pleasure one has in leaving that horrid, dirty, rainy, sickly hole for any reason is so great that it takes strong causes to produce even shades of difference. Information had been received by the Navy Department that upon the barren islet there were men, who had been abandoned to a possible death by privation, and at least, to a certainty, of great hardship, and by telegraph sped the order for the Powhatan to go and rescue them. She did go, did find and rescue them, and it is in regard to their adventures I propose to write for you.

Long messages are not sent at a dollar a word, including address and signature, and much was left for us to speculate over. Who were the abandoned men? How did they get there? Who abandoned them? How long since? Why did they not leave the islet by the same means by which they sent information of their being their? And lots more queries which, as they could not be answered until we got there, served to pass time, and give rise to sharp discussions. And the old ship seemed to participate in the feverish haste of all to get there. And in thirty-one hours from our fervent good-bye to Aspinwall, on the forenoon of the 20th, for we had so timed it that we should have benefit of morning light to find the islet, and of daylight to communicate, we sighted ahead a mass of foaming breakers, and as we approached, with good look out for broken water, a more solid looking speck amid the breakers but not one of them, glistening in the dazzling tropical sun. The whole cay is but a very small spot to find, but it is an extremely ugly one to be caught to windward of with anything the matter with sails or spars. The whole length of seven miles and a half is of unbroken breakers, varied, as we could see upon a nearer approach, by that beautiful light green color so frequently seen in those latitudes, where the water is shallow and the bottom of coral. There are ugly black rocky heads sticking up here and there, against which the heave of the sea expends itself with great fury and considerable noise, which probably gave to the cay its name. The sand patch itself is only 600 yards long by 300 yards in width and is only inhabited by birds who rest there at night and in the season lay their eggs and hatch their young. Boobies, man-of-war birds and gannets are the chief species.

As we neared the land, every glass in the ship was in requisition, and as, one after another, the various objects on shore became distinct and were identified, excitement grew until, when certain black points were seen to be moving, and later it was evident that they were men, the interest was at fever heat. First we saw a large square structure surmounted with a flag on its staff, and had it been a fort it could not have more closely resembled one; but a fort it could not be. The sailing directions describe nothing on the islet but a "few low bushes, a hut and a well of brackish water." This was neither; yet it was nothing new, and was there, differently arranged, long before the directions were written, as we afterward found. It consisted of some 600 tons of guano, which had been collected, screened, piled, and was ready for shipment. In close proximity—for on 7 feet high islets, over which the sea can dash when that way inclined, the high spot is the safest, and even so unsavory a neighbor as guano can be endured—were two shanties.

From these huts came running along the beach to a hauled-up boat three men, and soon they were pulling toward us. In our cutter, about to start for the shore, was the doctor, well provided with necessary remedies for weak and starving people; in the shore boat coming to us were three as hardy and healthy looking individuals as one often sees. Clad in the remains of a suit of ordinary shirt and trousers, no hats nor shoes, tanned and sunburned so black that we at first thought them Diegos, were three good-looking fellows. We thought they must be the survivors, and still kept prepared to send, under their pilotage, for the others; but there was no need. They were, to use the words of the poet, "The boatswain tight, the midshipmite and the crew of the Nancy brig."

We hove them a line and they came aboard. One, an Alsatian, who seemed to be the leader, spoke English very fairly; the two others, one German, the other a Hollander, not much. They had come off hoping to be able to buy provisions and clothing, and utterly ignorant of the fact of their having been sent for. When, however, they heard of our mission their minds were quickly enough made up, the temptation of returning to civilization being sufficient to overcome their sense of duty toward employers who had left them on an utterly barren island to shift for themselves, and to keep guard over a pile of screened guano while waiting for the said employers to return and gather up the results of their hard labors and sacrifice.

From their statements, which agree, it appears that they had been engaged by a party of New York and Philadelphia merchants, through their agent, Captain Genet, an ex-sea captain, to go to the Island of Roncador to collect guano. The original party consisted of fourteen, and were landed on the island inMay, 1884, the ex-sea captain being with them as superintendent. One of the men, Ryyp by name, was of this orignal party, and had thus spent over eighteen months on the islet; the two others had been there about eight months. Their contract was to collect the guano and ship it. Wages from $15 a month, and provisions, clothing, etc. They dug enough to load three schooners belonging to the company, each of which, on her departure for, they think, Wilmington, N. C., carried away some of the working party. In November, 1884, they having been left without a visit a long period, and provisions running low, the superintendent, with two men, started for Aspinwall in one of their boats, which had been raised and decked. Having no compass the trip was a long and hard one, but successful, for in a few weeks he returned with a Columbian vessel, which he had chartered to carry away guano. She was loaded and Captain Genet left in her for the North early this spring, leaving three months' provisions. Since then they had not heard from him, and were very anxious about him, as they had so high an opinion of him that they could not believe him in any way responsible for the failure to keep them supplied with provisions, etc.

When Captain Genet and party left, the islanders were reduced to four people—Ryyp, the Alsatian; Von Woll, the German; Van Shendel, the Hollander, and Jim Cooke, a heathen Chinee, who in the double capacity of cook and guano worker, got wages away ahead of the others, and in his third capacity, for which "the heathen Chinee is peculiar" managed to get what little the other fellows had in a get-at-able condition; that, however, don't include wages, for according to their statements, promises instead of payments have, up to date, been the rule.

I don't propose to go at all into the business questions involved. The original employers have no doubt something to explain, and it is to be hoped that for the credit of United States merchants they can clear it all up. Somewhere between the extremes of marooning and unavoidable accident, perhaps settling on one of the extremes, lies the true reason why these men were left to so rough a life, which might have terminated in a rougher death. The question would and may yet puzzle a Philadelphia lawyer and I don't like puzzles. I propose only to give some details of their life as they tell it, and in so doing regret that it should not be told with the pen of De Foe or the author of "Swiss Family Robinson," for with a little imaginative trimming, the story of these men would be most interesting.

While Jim Cook was with them they were quite comfortable, had huts to sleep in, plenty of grub, and a good cook, with work enough to make time pass; and that they worked hard and faithfully the immense pile of guano is a silent witness. I don't know much about gathering guano, but if given the problem, if four men working months can collect a pile of guano big as a fort, how long would it take "Piseco" to accomplish one-thirty-fifth of the same? I would without hesitation answer about a hundred years.

But as provisions ran low Jim began to get discontent. This discontent he concealed, and when, about three months ago, it was in August, the pork barrel having given out in June, the bread and worms and weevils mixed, a month or so later, and turtle oil grown rancid, Jim felt that his reputation as a cook was at stake. Boobies and conchs, under the most skillful treatment, cannot fill the lack of turkeys and oysters, and Jim thought he would, *pro bono publico*, go for assistance. A fishing schooner coming in Jim secured passage in her for, as he said, $60, and went to Colon, to charter a vessel to take away the guano and to procure provisions. With Jim was intrusted all of their turtle shell, about $150 worth, their spare cash, not much—and they were still awaiting Jim's return. He did send provisions, to a limited extent, however, for when the schooner returned, two months ago, she brought three bottles of rum and three pounds of tobacco. A bottle of rum and a pound of tobacco each. What could they want more? It turned out though that they wanted their contract, which, with other papers of importance, Jim, being the only man with a trunk, had kindly taken care of and forgotten to return. Jim now disappears from the story. Perhaps he is now in New York, and has established with the proceeds a washy washee and is growing rich.

I hope these boys will meet him some day. There will be a lively party.

Mr. Van Shendel, the Hollander, became Jim's successor, and judging by the appearance of the party, he has reduced the preparation of boobies, gannets and other wildfowl to a science. Such as there was, there was plenty of it, and no lack of firewood, for any quantity of drift wood came ashore from time to time.

Their time was spent in fishing, turtling, birding and bird-nesting. In regard to the latter they give statements which differ somewhat from those who write that the sea fowl make no nests, depositing their eggs at random. They say that very ingenious nests were made; small bits of sticks and weed woven together with wonderful skill, and each nest beautifully lined with soft white and gray feathers. The birds came to the island every night, and, sitting on the sand, were easily secured by clubbing. Except in the breeding season, all went away at early daylight, and even then all but those sitting or caring for the young.

As food they were tough and fishy; but the Roncadorians were not over-nice about that. Fights between "men-of-war birds" and the boobies, or rather robberies from the latter by the former, furnished amusement. The men-of-war birds rob the boobies of the fish they catch, just as our national emblem steals from the fishhawk. I had supposed that between boobies and gannets there was not much to choose; but I must warn my FOREST AND STREAM friends against luxuriating on the latter. Plain booby is the better; it does not give one the colic as gannet does. The turtle season was during June, July and August; while turtles were abundant the men lived high. They had to give up eating the eggs, which at first they liked, but which they found produced dizziness.

One of their amusements was turtle catching. Their description of the cautious manner of the old lady in approaching the spot where she proposes to reproduce, is good, but not new. As this letter is getting long, I'll skip it. They had considerable difficulty in procuring, uninjured, the turtle shell. Experts in shell gathering soak the shells, after the meat has been removed, several days in salt water, when they can be separated easily. Not being up in this business they tried the opposite course, drying it on the stove, with the result of losing much by cracking and splitting. The oil was very valuable to them for cooking and for lights. Green turtle and loggerheads were the varieties.

Fishing was good. Baiting with conchs—which, by the way, were one of their food resources, but proved indigestible, however cooked—they caught plenty of barracuda, redsnappers, gropers, etc., and an occasional shark, which contributed to the fun, if not to the larder. Fishing was with them pretty much as we always find it—a problem in which luck was a large factor. Sometimes for a week they caught nothing, and at other times all they wanted. And they couldn't find any peculiarity in the wind or weather worthy of being considered a "sign." So they dried and salted for such emergencies.

Sometimes, but not often, for their record is of but eight, a good-sized crawfish, about a foot long, varied their diet. I can't understand why they didn't get more of them; they are plentiful and cheap at Key West.

Among their sources of discomfort were land crabs. These were of two kinds—one the soldier crab, and the other a little but excessively annoying creature of a very black complexion. These fairly swarmed, and while very disagreeable as bedfellows, proved, under the circumstances, still more so as messmates. To keep them out of the shanties it was necessary to place tinned boards on edge across the threshold, for they were determined to be sociable.

So the men lived along on their speck of land and waited. And as in succession the various articles of provision gave out, until at last, when we came, their stock consisted of a barrel of wormy bread, 1½ pounds of flour and boobies *ad lib.*—things looked shaky.

They were plucky to the last, though. They came off to us for provisions, with no thought of abandoning their charge. They had twelve dollars among them, and intended to refit. When, however, the invitation to go with us was given, there was no dissent. So we hoisted in their boat, clothed and fed them, and have brought them back to the world. If wrong has been done them, the wrong was a great one. They are brave and honest men, and have been faithful to the last. PISECO.

[The caption of "Piseco's" paper was given it by ourselves. The three men arrived at this port last week.]

CAMP FLOTSAM.

XVI.—THE ANABASIS OF 1885.

FOR three hundred days, during which we had seen the world turn brown and die, wrapped in the spectral sheet of winter, spring forth with a joyful resurrection and burst upon us with the golden heat of its summer splendor, there had hung about us a glamor which neither the glory of autumn, the gloom of winter nor the beauty of the springtide could dispel. We were captives to a power which had enchanted us in the shadow of Canadian forests and on the shores of lonely lakes, and which, with the first breath of the new summer summoned us thitherward with a call from which there was no escape. As the days, one by one, went by, which were bringing us nearer to the hour of our flight, our thoughts went out to the land where the camp of 1884 had mustered, and where we had fondly hoped it would live over its older life. The ways and means could easily be disposed of, for tents and equipage had been stored at the outlet of Loughborough Lake, and it needed only the presence of its former lights to call the old camp into being once more. But when the roll was called there was an ominous response; rebellion and desertion met us at the threshold. Truthful James had set his heart on living in a house and doing penance over slippery, flabby steaks, heavy bread and powerless coffee, and the Reformer was bent on prospecting for a ranche in Dakota. But the call brought our old factotum, George, to the front, and with naught but pity for the deserters we shouldered our traps and started—the forlorn hope of the camp that was to be. Where it should be located was not yet determined; a half-dozen backwoods localities were under consideration, where trout and bass were in abundance, and where a line had seldom, if ever, been cast. Leaving this to the future, we struck a bee line for our camp stores, which were some sixteen miles to the northward of Kingston, Ont. Never were two days more alike than those which witnessed the anabasis of the camp in 1884 and 1885. A year to the day and to the hour separated them; there was the same cloudless sky above, the same burning drouth over the land, the same fiery heat around and the same longings for the shadows of the pines and the breezes from forest-bound lakes. It was like setting back the hand on the dial plate of time or turning back the march of the sun through twelve weary signs. There was no hesitation in selecting the route to Canada. The charm of "the old fishing line"—the New York, Ontario and Western—with its scenery of mountain gorges and bright waters, its views from western summits over the fairest valleys of the Empire State, its quiet retreats where knights of the split bamboo resort to revel in the best trout fishing to be found within a day's journey from New York, the charm of all these was enough to leave no thoughts of any other.

A delightful journey of two hours from New York brings the sportsman to Middletown, in the center of the boasted farming lands of Orange county. To the southeast one sees the mountain range which marks the boundary of the Warwick Woodlands, while still nearer lie the Drowned Lands, both celebrated in days gone by by the pen of "Frank Forester." One hour more and he is among the mountain brooks of Sullivan county, streams which for years furnished most magnificent trout fishing. Here, within easy reach from the stations of the New York, Ontario & Western, are the Neversink, Mongaup, Willowemock, Russell Pond, the Beaverkill, and the east and west branches of the Delaware, all famous in the past, and which at the present time furnish as fine trout fishing as at any time in their history. Since 1880 over a million young trout have been placed in the streams above named. In the year 1884 over three hundred thousand trout were put in the Willowemock, Beaverkill and

the branches of the Delaware, and all this at the expense and through the efforts of the management of the above-mentioned line, which is thus endeavoring to maintain the reputation of its trout streams. We understand that in the future the stocking process will be kept up by the addition of five hundred thousand trout annually to these streams. In the coming year fishing and camping cars, provided with sleeping apartments, saloons, kitchens, and a tent or two to each, are to be placed upon this line for the use of fishermen, and that can be engaged by the day and left upon sidings at such places as a party may desire. The cars can be used for living purposes by those who fish in the streams near by, while those in whom the camping instinct is strong can make trips to more distant streams and live out in genuine camping style. This system is much like that of the hunting cars on Western lines; and in enabling anglers to reach grounds which have been almost inaccessible, ought to be a grand success. If the yearly system of stocking the wild mountain streams of Sullivan, Delaware and Ulster are persevered in, the grand old days of sport will come back again to stay, and Livingston Manor, Cook's Falls, East Branch and Walton will become Meccas for anglers from the city.

But our trysting place was not among these famous trout streams. In spite of them all, our thoughts outran the train and buried themselves in far-off forests where two white tents would be the only signs of the habitat of man, and where once more the coon and whippoorwill would be our nightly companions. It was a tired and dusty trio that disembarked from the cars at Oswego at 11 P. M. that night and sought the hospitality of the Doolittle House and slumber. An early breakfast was necessary that we might take the morning train for Cape Vincent, and for it an order was given. With morning came the first botheration of the angler. The genius who presided over the culinary department kept us waiting at the table without service until within five minutes of train time, and we had barely time to swallow a cup of coffee before the call of "train ready!" came from the corridor. In none the best of humor we reached the depot of the Rome, Ogdensburg and Watertown road, purchased tickets and approached the almost unapproachable being who presided over the baggage-smashing department. Here we were met with a curt refusal to check a bag of blankets, for it was "agin orders" and they "couldn't go." There was no time for a parley, so we had a private interview with the master of the situation and saw our luggage safe on the train and, but for the loss of our breakfast, would have been content. Fortunately there was a balance to our credit in the lunch basket which filled the void, and we braced ourselves for another day. Men and women, youths and maidens came and went; earnest-eyed anglers with rods and baskets boarded the train with shortened breath, indicative of their having had a run for it, stopped a while and disembarked, bent on their quest. A change of cars and a reshipment of baggage came, then another, through both of which we kept a tender, anxious eye upon our all in all—that precious troublesome bag of blankets. But "our faith in time was large," and before noon we were standing on the deck of the little steamer bound up the river for Kingston. Here we had determined to begin our inquiries touching the best camping and fishing places. We were recommended to go in every direction, north, east and west, to places near and far, on the Rideau, to Clayton, Sharbot Lake, the Brothers, and a score of inland lakes. One proposed our taking the Kingston and Pembroke Railroad to Sharbot Lake, and the Canadian Pacific thence to Arden, a journey of eighty miles to the northwest, where, in a chain of lakes, lonely enough to suit the most fastidious camper, mascalonge and trout were taken, and the black bass was to be found in the glory of his perfection. It was an enticing proposal, and we made a memorandum for the trip, determined to give the place a trial. But the madame had been captivated by "Podgers'" Paradise, which that writer had located on Wolf Island, and some inquiry must be made concerning the same. The ardor of the madame was soon cooled, for she was informed by what seemed to be good angling authority that Kingston fishermen no longer resorted to the place described by "Podgers" for sport, that the time was when the fishing was good, but that its glory had departed. The article in FOREST AND STREAM concerning the Paradise, we were told, excited some comment at the time in Kingston, and it was asserted that its author had been imposed upon by stories of catches which had no truth in them. The camping question having been duly investigated, we set out for the base where we had left our duffle on breaking camp last year. We soon found the driver of the ancient tally-ho, and engaged a seat beside him for the journey. He proved to be an acquaintance of last year—a young jovial fellow by the name of Stoness. Some one in the backwoods settlement was dead and the stage driver had been commissioned to take back a coffin, for which purpose an extra team had been brought in.

In the middle of the afternoon we started, with our luggage fastened upon the coffin which followed close behind. Before we had made half a dozen miles there was a breakdown, and one of the hind wheels was found to be minus a tire. There were no houses within sight and no aid at hand, so we walked alongside the cumbersome vehicle for a couple of miles in the vain hope of conserving its energy for the last twelve miles of its journey. At last we came to the house of a farmer, who loaned us a heavy lumber wagon, innocent of springs, in which we were bumped and tumbled about for the remainder of the afternoon and into the night. The coffin, with our baggage, had passed us in the meantime, and now led the way. A little beyond, upon a rise of ground, stood a dilapidated church in the midst of a graveyard, the white stones of which were gleaming in the last light of the day. Was it an omen? When we passed it on our return a fresh mound marked the spot where the strong, ruddy hands which had held the reins were lying, folded "to be and abide, forever and aye in the dust by his side." Altogether it was an ill-starred, ghastly ride, though enlivened by the wit and good humor of the young driver whose sun was so near its setting. Tired and depressed we reached Bathersea and were received in the modest inn, the Queen's Own, kept by Van Alstyne. After a well-provided supper, we were greeted and welcomed by our deer-hunter friends and the acquaintances of a year ago. We soon found that our tents and traps were safe and in good condition, and we began to feel that our outing had commenced. Where we might drive our tent pegs was still uncertain, but we had placed the border between ourselves and care, and were determined, come what might, we would for the coming two months lord over time itself. Our aspirations had no bounds. The Ottawa was within reach by water, the Madawaska only a day away, while Rice and Stony lakes seemed at our door; we would try them all. Added to these, there were lakes abounding in bass in every direction about us, connected by waterways or only separated by short carries. It was too weighty a matter to settle at once, so we concluded to "sleep on it." The morning found us as far from a decision as ever, but with plenty of time on our hands in which to plan a campaign, for the rain was falling in torrents and outdoor work was impossible. There had been a considerable fall in the temperature during the night and a few loungers were gathered about the huge iron box stove, which, under the inspiration of an armful of wood, was pouring out fierce gusts of heat. A single clay pipe furnished solace for the party, and this was passed about from one to another, each waiting in patience for his neighbor to consume the charge of plug, with a supply of which every one seemed to be provided. A wooden settee, a table, washstand and half a dozen chairs, with our trunks, constituted the furniture of the sitting room, where all were assembled to pass a rainy day. The landlord was popular with his neighbors, the company was sociable, and the environment, with its novelty, was far from being unpleasant. The conversation was mainly of farming, with now and then a digression into politics, in which "Grits," "Conservatives" and "Sir John" came in for their share of praise and blame. It was Hindoostanee to us, and we failed to get the attributes of either, except that it struck us that the main difference between them was that which always exists between the successful and the unsuccessful, those who have and those who want—the eternal strife between the ins and outs.

Sometimes a deer story would draw forth a few comments, but nothing lower in the range of sports was accorded a hearing. With waters about them abounding in bass, lake trout and pike, no one thought or spoke of fishing, nor could we learn whether any of the former had been taken during the season. It was apparent that the native was not an angler.

All day long the clay pipe rolled out its volumes of smoke, the fire in the box stove roared and the rain beat against the eastern window panes. As night came on the group gathered closer about the stove, one or two more dropped in, and politics and deer, with an occasional dash of Riel and the rebellion filled up the evening. The hands of the clock went round to eleven before the door closed upon the last visitor and we sought the feather bed prepared for us in the little room which looked upon a hill crowned with stately pines, the sobbing and sighing of which came to us through the darkness like the wail of lost spirits which were being hurried to their doom before the storm.

In the morning, though the rain had ceased, the sky was still threatening, and the day promised to be anything but pleasant. After a late breakfast, preferring a drenching to being cooped up for another day, we carried the boat to the creek and pulled up the stream toward the lake. Again we breathed the odor of the white lilies which lined the shores and lay before us, an expanse of purity and beauty. It seemed as though time had stood still and that the flowers which had faded with the summer of the bygone year were yet around us. Softly and tenderly we pressed them back from the edge of the narrow channel and left them dancing unharmed in our wake. A short turn in the stream and the long familiar stretch of waters were before us. In front Garden Island rose in all its olden emerald beauty, while far down to the right an opening among the pines on the bluff marked the site of last year's camp. The granite cliffs looked a grim, silent welcome, and a pair of loons sitting in our course, just out of gun shot, greeted us with their *ho, ho, ho.* No other signs of life were visible on the lake; it was as lonely as on the morning when the fires of the Laurentian age hollowed the basin and thrust up the still unnamed islands of Loughborough.

With steady stroke we held on our course; the loons disappeared beneath the water and emerged a hundred yards away to the right; a blue crane that had been wading in the shallows of the island in front rose as we drew near and slowly winged his way to the woods on the southern shore. As we rounded the island, we caught sight of a solitary fisherman sitting low in his skiff, a half a mile away, and toward him we turned the bow. We were within a dozen boat lengths of him before he was aware of our approach, when suddenly he turned and we were face to face with our ancient friend Sabattis. We pulled alongside and were greeted with a stolidity the same as though only a day instead of a year had intervened since our last meeting. A single "How?" and the old man's interest in our coming was apparently at an end, and he resumed his fishing. A dozen or more two-pound small-mouths were hanging on a string from the oar pin, the fruits of an hour's fishing. We waited to see no more, but headed our craft toward the outlet, where our rods and tackle were lying, still unpacked. From that moment Rice Lake and all the rest were forgotten; we were in the midst of the haunts of the lordly micropterus, from which nothing but a batch of affidavits, proving, to a dead certainty, better sport in another quarter, could entice us.

Before our boat touched the shore the rain was upon us again, and we hastened to shelter, with the prospects of getting settled in camp or fishing as far off as ever.

WAWAYANDA.

THE DEVIL FISH OF ESTERO BAY.

IT has been suggested to the writer by our mutual friend, Dr. Ferber, that some of the incidents which occurred during a certain trip made last season down the western coast of the peninsula of Florida were worth preserving. If it were possible to picture to your readers the events of such a day as vividly as memory presents them to the actors, then might this communication justify itself. The day selected for the experiment is March 10, 1885. The boat is the sloop Ella M. Little, of about eight tons. Captain and owner, Alfred P. Jones. Pilot, Wilson; Christian name omitted, as a suspicion exists that he was never properly baptized. Able seaman, Abram. Supernumeraries, Messrs. Blank and Black, otherwise the "big" and "little" doctor, well-known physicians of Chicago, genial companions and ardent sportsmen; and lastly the writer, Time, sunrise. (Note.—The big doctor has taken a contract to have us always under way by daylight, and proposes to keep it up if he kills us. True, he occasionally makes the mistake of routing us out at midnight, but he means well, and we forgive him.) Location, a few miles south of Punta Rassa, and just opposite the entrance to Estro Bay.

The day is a perfect one, the air soft, balmy, and inspired by a gentle breeze from the west. One of the party is seated upon the cabin sweeping the horizon with his omnipresent field glass.

"Pilot, what's that big fin half a mile away on the weather bow?"

"Devil fish."

"Devil fish! Pilot, that's what we are here for. We want that fish."

"You don't want to fool with no devil fish; there ain't no child's play about them."

"Pilot, we want that fish."

"Yes," adds the little doctor; "we will have him if we have to follow him home."

"Well, if I must, I must; but you've got to tend line, and the others get into the cockpit out of the way. I don't want any one killed by this blanked foolishness."

"We will do as we are told, if it is to jump overboard; only, strike that fish!"

Off come the pilot's coat, shoes and stockings, the anchors are carried aft, everything movable taken from the forward deck, and three or four hundred feet of half inch manilla rope coiled there. The jib is hauled down and carefully lashed. The pilot plants himself upon the bowsprit, with his heavy pole balanced in his right hand, his left gathering in a few coils of the line which he has just attached firmly to the harpoon. The hand of the captain is on the tiller, while his eyes follow every motion of the pilot. Abram stands by the halliards ready for the expected order. One of the passengers, with hands trembling with excitement, holds the line, prepared to give it a turn around the windlass or his own neck, as he may be instructed. The other two sit with their rifles on the top of the cabin, equally ready to jump overboard or down among the coils of line, according as the one or the other gives promise of most excitement.

"Port."

"Port it is."

"Steady."

"Steady it is."

"Starboard."

"Starboard."

"Keep her off a little more, now luff."

Thud! Crash! A young waterspout under the bow, a line whizzing through torn and blistered fingers.

"Down mainsail. Give that line a turn round the windlass. Hard down your helm. Catch that pole." But everything cannot be done at once. The line has a double turn around the windlass; the sloop is already plowing the water in the direction of the great fish, and the harpoon pole is fifty yards astern. Into the skiff tumbles one of the party, and, pulling vigorously, soon recovers the pole. To return is less easy, and when, after a long pull, our friend is within forty yards of the sloop, the monster, suddenly changing his course, swims straight for the little boat. For a moment the occupant contemplates the sport of the chase from an unusual standpoint (for a man), but happily his boat is barely touched by one of the great wings of the gigantic "sea bat," and he soon finds himself safe (and warm) on board. Back comes the fish, and a casual blow makes our craft shiver from stem to stern, and suggests that we owe much to the ignorance of our prey.

Somebody's rifle cracks and the spouting blood and crimson wake promise to our inexperience the approaching termination of resistance and consequently of sport. But neither one bullet nor the score that follow it avail in the direction of our anticipations. Deeper and deeper swims the fish, now probably forty feet below the surface, but straight out into the Gulf and with increasing velocity. The occupants of a pleasure yacht which we pass, gaze with wonder upon a sloop bowling along against wind and wave without a sail set. The wind is increasing; waves rising; hours passing. The weight of three men is constantly on the line hauling in as opportunity offers, paying out as the vagaries of the fish demand. An occasional foot planted within the coils of line on the deck elicits a caution from the pilot in language which, although sometimes theological, is not deficient in vigor. One by one we steal into the cabin and come out with a mouthful of doughnut.

Our captain, after a glance in the direction of the now invisible shore and another toward some fast gathering clouds, incidentally observes, "That devil fish is bound for Mexico."

"Then so are we, Captain."

And yet something must be done. To openly suggest cutting the line would expose one to the risk of assassination.

So another turn of the line around the windlass, the bars inserted, and the sloop walked up toward the fish until the parting of one of the strands of the rope warns us we must draw the line of mechanical force somewhere.

But now the back of the monster is again seen near the surface and some thirty feet beyond the bowsprit. Another harpoon is hastily prepared, another thud, flurry, and renewed excitement. Now we have two lines on the windlass. Soon the devil fish is swimming directly under the bow, but with undiminished energy. A great shark hook is soon cast in his cavernous mouth, its heavy chain carried aft and made fast, the big mainsail and jib hoisted, and our bow pointed away from the heavy wind now blowing straight for Estero Bay. We sit upon the stern of the sloop watching the great mouth, the curious horn-like flippers, and the wonderful power and grace of the propeller-like wings, as with oft-loosening chain the great fish swims easily after us.

As we reach the entrance to Estero Bay, and are about entering it, our captive suddenly awakens to the possibility that perhaps he is after all not carrying out his own ideas. His powerful propellers are worked backward, the spray covers us, the commotion in the water is tremendous, and for a moment the result seems doubtful. But wind and sail prevail, it is a dying flurry. Soon we have him anchored as near the shore as six men aided by pulleys can bring him; his broad back (eighteen feet from wing to wing) above the water so that we can safely venture on it. We examine the curious half fish and half leeches which have domiciled themselves upon the back of our victim, and are greedily sucking the wounds made by our rifles. We remove a square yard or so of the tough and rasp-like hide with a view to future slippers, and proceed to sink a shaft through gristle and flesh (bone there is none) into the creature's interior. This at the instance of our medical companions, who insist that autopsy naturally follows death. The peculiar organism disclosed, the information obtained from a medical and scientific standpoint are subjects partaking too much of the character of useful information for this paper. It is already sunset, and our caterer invites us to indicate our preferences in the matter of a proposed supper. The firm flesh of the fish with its steaks of bright red and pure white suggests the answer, and we try a gastronomic experiment, which is as successful as we believe it to be unique.

A. W. D.

NEW YORK, Dec. 15, 1885.

LOST IN THE SNOW.—Wausau, Wis., Dec. 11.—The body of Forest McKay was found yesterday in the southern part of the city, only ten rods from a public thoroughfare. He had been out hunting the day before, and had evidently become lost in the blinding snow storm of Wednesday night, and been frozen to death.

NIGHTS WITH THE GRIZZLIES.

THROUGH the courtesy of Major H. W. Merrill, we are permitted to publish the following letter, sent to him by our correspondent "P." The tracing of the ball of the bear's foot is exact size. The points A A are the balls of the toes; C C, the points of the claws:

RANCHE ON HELL-ROARING RIVER, Wyoming, Nov. 8, 1885.

Major H. W. Merrill:

MY DEAR FRIEND—Secondary only to the enjoyment of the pleasures of the field by yourself is a truthful account of hunting incidents by some friend, and so I thought an account of some experiences with large bear this summer and fall might interest you. This account is prepared the more cheerfully in the hopes, to some extent, of making amends for my dereliction as a correspondent for several months past.

Though we have not communicated as often as usual, I have taken great interest in the rifle columns of the sporting papers; more especially in the practical and instructive communications from yourself on the subject of trajectories based on the experiments of yourself and Mr. Romer. The trajectory of the Merrill loader cannot be equaled, especially when combined with its accuracy. Why not publish all your experiments? They would be a valuable contribution to the discussion of a subject that is now engaging the attention of riflemen.

It is gratifying to see an interest awakened on this subject. More practical information as to the flight of the rifle ball can be obtained from such experiments, where the screens of the range are within small intervals, say 25 yards, than from pages of purely theoretical talk. You know this is an old hobby of mine, having frequently urged the making of such experiments in the Eastern States, say at Chicago, about 600 feet above tide, and at tide level, say at New York. I was desirous that these experiments should be made as a supplement to the two elaborate series of experiments made by myself at an altitude of about 5,000 feet. One reason was to test the extravagant claims of some rifle makers for the trajectories of their rifles, but who, like Dougal, were unwilling to come to the test. Another reason was to ascertain the different trajectories made by the same rifle with the same cartridge at the different elevations, or in other words to test the question as to whether there would be a more complete combustion of the powder charge at the higher barometrical pressure.

If the trajectory for the same cartridge was found to be the same at tide level as at an elevation 5,000 feet higher, it would go to prove that there was a more complete combustion of the powder, and consequently a higher initial velocity at the former level. So I was glad to see the new paper, *The Rifle*, had commenced its career by (to some extent) supplying this want, by publishing some experiments made near Boston, and that the FOREST AND STREAM was preparing to make a still more extensive series. But for the long time required to communicate by mail I should have made to them some suggestions gathered from my own experience in such experiments. Time, however, did not admit it, after receiving notice. I notice the statement by the editor of that journal that up to this time there had been no reliable experiments made with American sporting rifles, and was very much obliged to you for reminding them of my experiments, whose correctness substantiated by experiments of a subsequent year, have never been challenged, and embraced all the sporting rifles now being used in an altitude where most of the big game of the country is to be found (except the Winchester express whose trajectory was subsequently given). There are a few other rifles used now, but as they use the same cartridge as some of those experimented with, their trajectory would be substantially the same. I am curious to see the difference in trajectory taken at tide level by some rifles of my experiments, and whether the trajectories taken near tide level will suit the altitude around the foothills of the Rockies, where most of the big game of the country is now to be found.

This is quite a digression from the object of this letter, and that was to give an account of some experience with the grizzly bear this summer and fall. Here let me correct some impressions prevailing among sportsmen from the East as to the proper time to hunt this animal. As detailed in the sporting papers, one sportsman hunting late in the fall finds them at the timber line, and having some success and basing his opinion upon some one acting as guide, is satisfied that is the only locality to find them, and that you must stealthily follow his trail through dense timber, as he did. Another sportsman finds them below the foothills among the bad lands, and thinks that is the proper locality; and so each one is governed by their own particular good luck and experience. This reminds me of the heated controversy that agitated some of the readers of one of the sporting papers a few years since as to the color of the jack rabbit of the plains; one party contending they were gray and the opposite party that they were white, each party citing his own restricted experience with that fleet-footed animal. To those having more extended observation it was plain that each side was right to a certain extent as well as wrong, for it is well known that the jack rabbit is gray during summer and fall and turns white in the winter, and then again shedding his white coat in spring; at least that is the case in Wyoming and Montana.

So with the grizzly. He is essentially an omnivorous animal; his food varying with each season and the locality where such food is obtained and his own habitat varies accordingly. He lies in his winter bed until routed out by the melting of the winter snow, and the ground being still frozen, he has to rustle for his grub. He soon becomes poor from the necessity of much traveling around for old carcases and whatever food comes handy. He is then usually in the foothills. In the summer his food is more vegetable—grass, roots, plants, etc. His haunt is then on the highest mountain plateaus, where he does a great deal of rooting in a certain kind of loose rock and loam. In the last of summer berries are ripe, and he is then found below the foothills and in the bad lands or wherever chokeberries, plums, bullberries, etc., are found. In the fall he craves animal food and is then found high up in the foothills or again on the mountain plateaus wherever game is most abundant; and in November and December he seeks his winter quarters. The remarks do not apply to grizzly bears that are found in the badlands bordering the Missouri or the Lower Yellowstone, as they live there the entire year, "holing" up in winter in the bluffs of those desolate-looking regions.

The intellect and intelligence of the grizzly bear are not fully appreciated. Strip him of his hide, stand him erect on his hindfeet, stick a plug hat on his upper end, and he resembles in anatomy and general appearance that "noblest work of God"—man. A little too long-bodied, neck a little short, but otherwise, looking at the muscles of his thighs and forearm, a veritable athlete. Reclothe him in his fur, place him on his all-fours, watch him rooting around for grubs and worms and carrion, and wallowing in mud and filth, he resembles in apparent stupidity and habits the lowest type of animal—the hog. Yet those well acquainted with his characteristics will, I think, agree with me that in intelligence and intellect he is not many grades in the process of evolution below man.

About the middle of July last word reached me that there was considerable sign of bear "rooting" on some high mountain plateaus not many days travel by pack outfit from my ranche. Taking a pack outfit, including my fur-lined sleeping bag, a good mountain man and a lad of fifteen to take care of camp and the horses, and enough grub for a few days, we reach the locality, after a hard climb, about noon on the 18th of July. We make camp at about 8,500 feet elevation on the head of one of the forks of Four Bear Creek, having to pack wood up from below for making coffee.

We strike out after lunch up the gulch, and after going a few miles discover a grizzly rooting among the rocks well up to its head, near the summit of the range, which is here between 10,000 and 11,000 feet elevation. A reconnoisance indicated that the only chance to approach him to windward was by crossing the mountain to the right into the valley of another fork of Four Bear Creek. Acting accordingly, we climbed over the mountain divide and were making along its opposite slope, when just in our front about a mile off, near the head of the gulch on the right, was discovered another grizzly rooting. It was agreed that I was to have the shot, and it became necessary to leave my horse and dogs back with the men. I took it afoot. A little study of the ground showed that in order to approach him successfully, it was necessary to descend to the bottom of the gorge on the right, and to ascend along its bed. This I proceeded to do. Just before reaching the bed of the gorge I was exposed to view, and was walking fast or running to get the advantage of its friendly cover. When within about fifty yards of the bottom, and with my attention directed to the bear about half a mile away, a large grizzly forced himself on my attention by rising from his bed in the bottom of the gulch, and walking slowly away he commenced ascending diagonally the opposite and steep side of the gorge. The old rascal during the heat of the day had dug a bed in the cool bed of the branch, was taking his afternoon siesta, and evidently resented being disturbed. From the sullen way in which he made off, occasionally looking back, I felt he was going to be ugly. Quicker than it takes to write it I had two cartridges in my right hand, which, with the one in the rifle, was thought sufficient, for at that time the size of the beast was not realized. The cartridge in the rifle was a 110-270 grain Express, and those in the hand 110 270-grain and 110-340-grain respectively, all Express balls.

While making these preparations, the bear, going diagonally up the side of the gulch, had disappeared behind a huge conglomerate boulder that overhung the stream. Seeing he must soon emerge, I dropped on my right knee and stood ready to fire at the first favorable opportunity. In a moment he emerged from behind the boulder, walked up a short distance, stopped and looked back, exposing his left side to rather more than a quartering shot. Aim was quickly taken for his heart. A report followed, and the little express ball did its work well. It broke two ribs, three or four large fragments entered the heart and the balance of the splinters scattered through the lungs. Making but little noise when hit—an ugly sigh—he, as almost invariable with this species of bear under like circumstances, tucking his head between his hindlegs, rolls down into the gulch, using his forelegs for guides. He comes up with a bounce, is on his feet in a moment and making a rush straight for me. I am loaded in a jiffy with the other 110-270-grain cartridge, but wait a moment until he commences ascending my side of the gulch, hoping with a good shot to roll him back. Crossing rapidly the bed of the gulch, he was in a moment ascending toward me, and when within about thirty yards (he was originally about seventy yards at the first fire) I fired at his front, hitting at the point of the right shoulder, shattering the socket-joint and that bone half way to the elbow. He does not roll back, but is demoralized and sickened and has not the sand to come further, but changing his direction to the left about forty-five degrees, passes within twenty yards to my right front; I am loaded and ready for another shot as he passes. He appeared so near done for, however, that I hesitated to fire, wishing to have some practice on him for my two young dogs Bob and Snip, which had never seen a live bear. He, however, seemed, after passing, to mend his licks so fast that I feared he would give trouble in despatching him, so I ran rapidly after him, he in the meantime having partially disappeared under the bank, and when within fifteen or twenty yards he turned at bay, facing me. Before he could charge, if such was his aim, the 110-340 grain cartridge was delivered into the side of the neck within the collar bone, making a fearful wound and rolling him down into the gulch, where he soon died. It was only after Rush came up and he had been rolled over that his dimensions were realized and the danger I escaped by the little ball doing such execution at the socket joint. Had it struck an inch and a half to the left, he would have been on me in a few more jumps, and though another shot would have been given, I think, unless a paralyzing shot in the brain or spinal column, he could have so torn and lacerated me as to make death preferable.

I have been in a half dozen such scrapes with these bears of more or less danger, but have never lost my presence of mind until the bears were dead and the danger passed through realized. I have always determined never to run, but to face them and fire away, believing that the least sign of fear with all animals gives them additional courage.

I had an adventure similar to this with a she bear that had been approached within fifty-seven yards. It was a bright moonlight night and her cub was squalling in a beaver trap by her side. A good shot was delivered over the heart. Three shots were delivered as she rushed forward, first by myself, then one from Le Corey, who was backing me, and then another by myself, and when the "racket" was over the bear was lying dead twelve yards from us. All these shots were bullseyes and deadly. In this case I could not have run had the spirit moved me, as from a serious accident I had been on crutches or my back for twenty-four days and hobbled up the mountain in this instance with the help of a crutch and a stick, Le carrying my rifle.

A familiarity with all the breech actions of the day, together with an extended experience with the Sharps system, has convinced me that the latter system, in safety, facility and rapidity of manipulation is not equalled by any. Take the next best, the double barreled rifle, only two shots could have been delivered in the two before described adventures. I have never had sufficient confidence in any of the repeating rifles to use them against dangerous game, where so much better could be had. Their want of power, their facility for getting out of order at the wrong time, especially when rapidly manipulated, combined with the fact that their rapidity of fire was very little greater than a system like the Sharps, were the considerations that have influenced me. In my opinion there has not yet been invented a repeating apparatus that is equal, under all circumstances to the human hands, in connection with a good breech system.

A better idea of these bears can be had from measurements than from weight. The stereotyped size of those killed by true sportsmen is "1,000 pounds." Their size, average fat, is 350 pounds. The bear first alluded to was a very large one (one among three of the largest ever killed by me), and, judging by one killed and weighed subsequently, he probably weighed 600 pounds., though not fat. His length as he would have stood was 6ft. 10in. Measurements show he could have stood erect on his hind feet to the height of 8ft. His head was 18in. long by 12in. wide. His hind foot, a tracing of which I send you, was 11¼in. by 6in. Forefoot, without the toes, was 7in. by 6in. His forearm, after being skinned, measured 18in. around. His skull, which is preserved, 15¾in. by 9in. The tusks projected from the gums 1⅝in. With the .45-caliber rifle used I have killed nearly 40 bears, but with the exception of this one using a 340-grain express ball. The 270-grain express used here was a .44-caliber used for several years on deer from a .44-caliber rifle. It did very good work in this instance, but for a large bear the heavier ball is preferable. The 270-grain ball flies remarkably true for its weight.

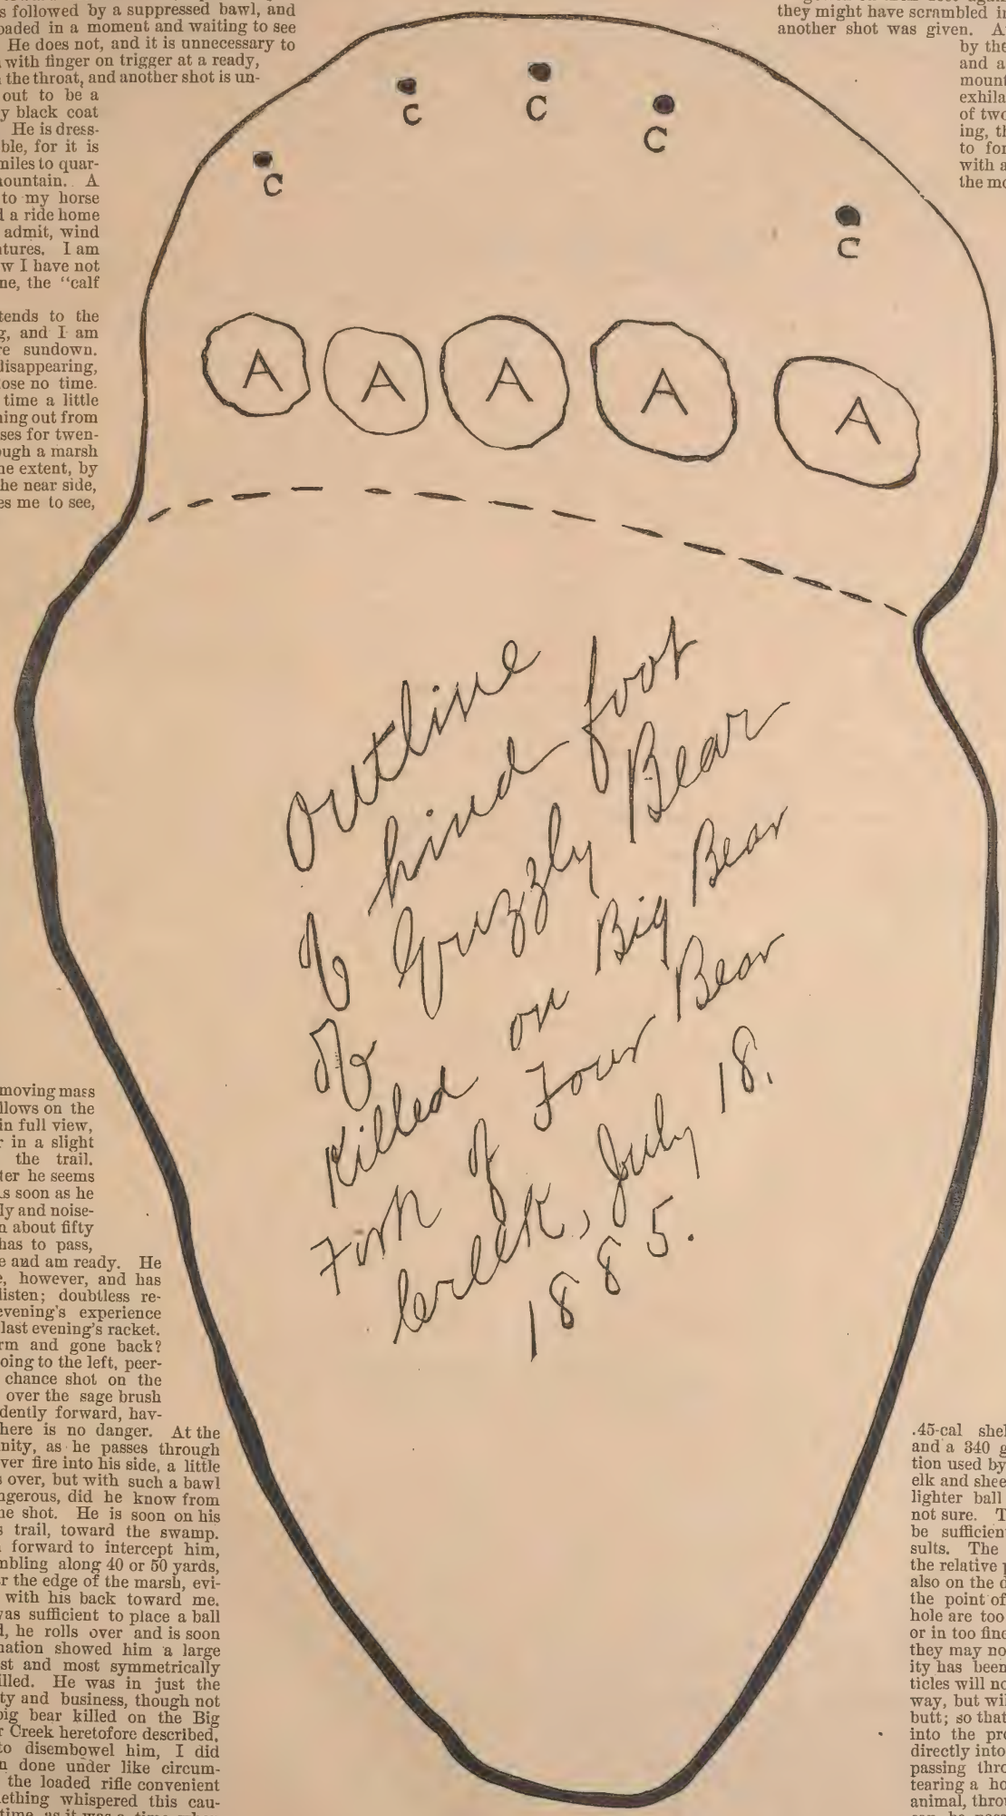
In the process of skinning the bear, it was found that this was not the first encounter he had with mankind. In the muscles of the neck and of the right foreleg above the elbow and next to the bone, were found four rifle balls and a large fragment of another ball. The wounds had cured up and each ball was inclosed in a sac with the appearance of having been placed there several years. One .42-caliber 205-grain lead ball in the muscles of neck, one other of same caliber and weight, two .50-caliber 375-grain lead balls and the large flattened fragment of a ball in the muscles of one foreleg next to the bone. The .42 caliber balls I judged were fired from a '66 model, .44 caliber Winchester, and as all the balls were little battered and did not shatter the bone, they must have been fired from a rim-fire cartridge, all balls cannellured.

The bear I was after when this one was stumbled on, took to his heels and disappeared rapidly over the mountain after the second shot. We went for the first one seen, but the dogs getting the wind of him and having a taste of bear's blood, ignominiously "broke" and stirred him up. We chased him on horseback and afoot for three-quarters of a mile, but did not get near enough to get in an effectual shot. The dogs that had never before chased a live bear, could run alongside of him, but did not take hold. Probably you or I would have done the same thing under the circumstances.

Haying time cut short this hunt. A short time afterward one of my neighbors complained of the depredations of bears among his thoroughbred cattle, having recently lost two yearlings. I suggested that if he would furnish the medicine in the shape of a carcass a repetition of such business might be stopped. He agreed and I at once reconnoitered the locality and selected a point in the valley of a small mountain stream where he had the carcass promptly planted. An almost daily inspection was made of the medicine, but not until the morning of the seventh day were there any indications of its being disturbed. Promptly on hand at 5 o'clock that evening I was rather incautiously approaching under cover of a slight rise of ground and the sage brush and had gotten within 150 yards when a dark object appeared to rise out of the earth, that to my startled imagination appeared ten feet high and proportionately broad. Recognizing the situation at once, I rose up off hand and pulled, but the firing pin failed. This had never before happened under such circumstances, and only a half dozen times in the rifle's history, for want of attention to the firing bolt. He gave me time to cock and fire, but there coming no answering "bawl" it was evidently a miss, resulting from my being "put out" by the previous mishap. He was rapidly followed to the edge of the willow swamp (about 150 yards), through which the trail passed, where he was seen, evidently unwilling to forego his evening meal. He quickly sat up, made me out, and at once disappeared before a shot could be delivered. I gave him up that time, very much discouraged for failing to bag such a large grizzly. He was evidently a boar and certainly was not much scared, and from his size and actions I was satisfied he was the fellow that stole my neighbor's yearlings. The next evening, Aug. 17, I was on hand early, but, acting on previous experience, took a different position on his trail a hundred yards from the medicine. The direction of the wind forced me to take position with my back to the brush from which the bear would probably appear. This did not suit me. On first arriving on the ground a dark object came rapidly down the mountain side, about one mile up the valley, through an opening. This evidently was a bear, though not apparently as large as my friend of the evening before, and I felt sure he would make his appearance did he not take the alarm. Lying down, protected by some sage bush, I waited patiently until the gray light of approaching twilight, but no bear appeared.

Can you recall your feelings when, as a boy, passing through a graveyard at the hour of dusk, thinking with the poet:

> 'Tis now the very witching time of night
> When churchyards yawn and hell itself breathes out
> Contagion to this world.



How with what superstitious dread you look cautiously around, expecting a hobgoblin at any moment to rise out of the ground? How every noise—the crackling of a twig—startles you? So it is with me when watching on the trail of this bear at such an hour. When occasion requires it, his movement is as stealthy and noiseless as a cat. You hear the rolling of a boulder up the mountain side in the timber several hundred yards away. You know it must be done by some large animal, and you suspect a bear. Presently the same noise, but closer, and your faculties are all on the *qui vive*, and you are expecting every moment his appearance. You wait what, to the excited senses, appears a long time. What has become of him? It was, perhaps, a false alarm, and you are discouraged; when presently there he stands, apparently right on you, and seemingly rising out of the ground.

So it was on this occasion, as I lay about thirty feet in the open from the thicket in a prone position in the grass, clothed in soiled buckskin, with three cartridges in left hand and

finger on trigger, ready to rise into a sitting position and deliver fire. Hark! the crackling of brush almost behind me. It is a moment of intense interest, for I don't know where he will appear. My attention is kept constantly to the rear and left rear. No more noise. What has become of him? It is getting very dark and may be it was a mistake. Presently, there! right on me apparently, but really fifty yards to the left rear, stands a black mass that must be the bear. I rise cautiously to a sitting position, and as he stands, looking wistfully up toward the old horse, I pull away at his side. The report is followed by a suppressed bawl, and he rolls over. I am loaded in a moment and waiting to see if he regains his feet. He does not, and it is unnecessary to fire. I walk up to him with finger on trigger at a ready, but the death rattle is in the throat, and another shot is unnecessary. He turns out to be a black bear with a very black coat and pretty well furred. He is dressed as quickly as possible, for it is now dark and it is six miles to quarters, over a trailless mountain. A walk of half a mile to my horse Pike, and then as rapid a ride home as circumstances will admit, wind up the evening's adventures. I am well satisfied, but know I have not yet gotten the right one, the "calf killer."

Rush skins and attends to the hide the next morning, and I am again on hand before sundown. The old horse is fast disappearing, and it is desirable to lose no time. Position is taken this time a little nearer the trail. In coming out from the willow brush it passes for twenty or thirty yards through a marsh that is screened, to some extent, by scattering willows on the near side, and my position enables me to see, through these willows a portion of the trail over which the bear will probably come. A storm had, late in the evening, passed around the mountain, and a strong and favorable wind was blowing. Lying down prone among the sage-brush, in a position favorable for observation, with everything at a ready, I wait patiently. Sundown comes; the mountain to the west casts its shadows around. It becomes quite dusky; so much so that I experiment as to whether the foresight can be seen, otherwise a wad of white paper must be tied over the front sight. It is yet unnecessary. It is now the witching time when this bear likes to prowl around. The senses are all on the strain as they are directed to the left rear. Just then a dark moving mass flits by between the willows on the trail and soon emerges in full view, but again to disappear in a slight depression passed by the trail. Heavens! what a monster he seems in the dim twilight. As soon as he disappears I move rapidly and noiselessly forward to within about fifty yards of the trail he has to pass, drop on the right knee and am ready. He does not come to time, however, and has evidently stopped to listen; doubtless remembering the first evening's experience and being in hearing of last evening's racket. Has he taken the alarm and gone back? When on the point of going to the left, peering over and taking a chance shot on the run, his back appears over the sage brush and he is moving confidently forward, having satisfied himself there is no danger. At the first favorable opportunity, as he passes through the sage brush, I deliver fire into his side, a little too high, and he rolls over, but with such a bawl as to indicate he is dangerous, did he know from what direction came the shot. He is soon on his feet going back on his trail, toward the swamp. Loading quickly, I run forward to intercept him, and find him, after stumbling along 40 or 50 yards, in a sitting position near the edge of the marsh, evidently near done for, with his back toward me. A moment's interval was sufficient to place a ball in the back of his head, he rolls over and is soon dead. A hasty examination showed him a large bear and the handsomest and most symmetrically formed I had ever killed. He was in just the proper flesh for activity and business, though not quite as large as the big bear killed on the Big Bear Fork of Four Bear Creek heretofore described.

Before proceeding to disembowel him, I did what had always been done under like circumstances, that is to place the loaded rifle convenient for instant use. Something whispered this caution, especially at this time, as it was a time when another bear might appear on the trail at any moment. Keeping my eyes as much as possible at the point on the opposite side of the marsh, where the trail debouched on to it, I had proceeded to rip the carcass from the throat to the pelvis and had my hands already messed up in a mass of liver, paunch, express balls, etc., etc., when my attention was drawn to a dark mass at that point and in a moment my rifle was in hand ready for the emergency. By the time I was ready to fire he had discovered something unusual in his front and had "sat up" to make me out. Before doing so aim had been quickly taken at his brisket, and at the report he had tumbled over, the ball striking the left side, fragments penetrating the heart. Judging from his boldness in stumbling on to me, in not exceeding fifteen minutes' time after my last shot, he was expected to show fight, but instead he made back on his trail as fast as his condition would allow. From previous experience in just such circumstances the necessity was at once recognized of a cautious but vigorous pursuit, if he was secured before hiding in the brush, and without hesitation I plunged through the marsh half knee deep in mud and water and entered the narrow trail on the opposite side. Pursuing it rapidly for thirty or forty yards to where it passed through a little opening, there within ten steps of me was a dark mass breathing heavily and lying partially behind a small clump of willows. Putting a telling shot through the center of the mass he appeared to wake up and gave an exhibition of some of the grandest ground and lofty tumbling, at one time appearing to stand upon his head and kicking with his hind feet ten feet straight into the air. As he did not get upon his feet again another shot was unnecessary and he soon settled down and was dead.

This bear was as large from tip to tip as he of the Big Bear Fork, but not as fat nor as large-bodied; in fact, not as heavy as the one just killed. Neither of these bears, I think, needed a second shot, and undisturbed, would not have gotten on their feet again. A dense thicket was near, and they might have scrambled into its cover and have been lost, so another shot was given. At any rate, darkness was at hand by the time the carcasses were dressed and a dense fog was settling over the mountain that had to be crossed. The exhilaration of spirits from the killing of two such large bears on the same evening, the bear that I was after, caused me to forget fatigue and fog, and it was with a light heart Pike was mounted and the mountain ascended. A thick fog soon enveloped us, so that nothing could be seen beyond a hundred feet. Pike and I soon disagreed as to the direction, but I insisted on my way. After going a half mile and getting into some rough ground, it was evident that I was wrong and completely befogged. The rein was then given to Pike and he turned squarely to the left, and, having gone 600 yards over some pretty rough ground, he came to the head of the game trail leading down the mountain, and which we had several times traveled. Pike had his way the balance of the ride, and after passing across the drainage for two miles we got below the fog, and by 10 o'clock we were at home.

As an indication of the labor usually undergone in hunting this bear, it is stated that seventy-five miles were traveled before the first shot (one half of which was in the night) and one hundred and five miles before killing the three. I have since traveled more than a hundred miles after a special bear and was repaid by only one shot at long range and no bear.

The next day Rush and McDevitt skinned and packed in the hides and fat of the two grizzlies. The weighing apparatus was taken along and the "calf killer" was found to weigh 405 pounds after being dressed sixteen hours, the other something less. The black bear was not weighed, but it is presumed he weighed about the average of this species (175 pounds) in life.

The rifle used is the same used for several years, a .45-caliber Sharps, with which I have killed nearly forty of these bears (thirty-eight to be accurate), of which number twenty-two were killed with a single shot each, using 110 grains C. & H. No. 6 and a 340-grain express ball. As I have before stated, the rise of its trajectory is 7.01 inch in 200 yards, an average of about twenty shots through a trajectory range. Previously I had used a 44-caliber Sharps, with a bottle-neck shell holding 100 to 105 grains of the same powder with which a good many bears had been killed. No especial ball has been determined on as best for bear and elk and sheep. With exceptional opportunities for several years past among all our big game, together with a careful study of the subject, based on a dissection of wounds made by different combinations of powder and ball, I think the 2¼ .45-cal shell with 110 grains strong powder and a 340 grain express ball of the description used by me is most destructive for bear, elk and sheep of all American rifles. A little lighter ball might answer, perhaps, but I am not sure. The amount of powder would not be sufficient for a heavier one for best results. The best results not only depend on the relative proportion of powder and ball, but also on the diameter and depth of the hole in the point of ball. If the walls around the hole are too thin they will break off too soon or in too fine pieces. If the walls are too thick they may not disintegrate until the ball's velocity has been so much retarded that the particles will not have velocity to make their own way, but will follow the channel made by the butt; so that a good many considerations enter into the problem. The ball in question, shot directly into a bear, elk, sheep, etc., will, after passing through the skin, break up, usually tearing a hole through the ribs even of a fat animal, through which the unclenched hand can be passed, the fragments scattering in a cone shape, the larger fragments penetrating to the opposite ribs. In this way the whole momentum of the ball is expended on the vitals, the heart and lungs. Hit further back it breaks up into still smaller fragments, making a terrible wound in the paunch and entrails that none of those animals can long survive. I have never known it to fail in breaking the large bones of the largest bear or elk when coming in contact with them.

For deer and antelope my .40-caliber is found sufficient

using 100 grains of strong powder and a particular express ball of 270 grains. It makes about a 6½-inch curve in two hundred yards and the ball flies very true. I use also in the .45 caliber the .44-caliber ball before alluded to, using three thicknesses of patch paper. It flies remarkably true for its weight, and makes a 6.34-inch curve per 200 yards, with 110 grains C. & H. No. 6. I failed to say at the proper place that the degree of hardness or per cent. of alloy had a great deal to do with the execution, as well as accuracy of flight of the express ball. When pure lead, they break up too soon. Nor have I ever known a reasonable degree of accuracy obtained with any lead ball with a comparatively large charge, beyond 50 or 75 yards. They are knocked out of proper shape by the time they leave the muzzle. This want of accuracy has been observed with the best English express rifles with light leaden balls. I find in my experience with the balls of my preference (as above) that from 5 per cent. for the heavier ball to 8 per cent. for the lighter is best.

A 20-bore double-barrel shotgun, made by Bland & Sons, of London (chambered for the Kynoch brass shell), for ducks, the several species of grouse, jack rabbits, magpies, skunks, etc., complete my battery. I value the latter very highly for its "executive ability," combined with a weight of only six pounds.

I have written you a long letter, a kind of *omnium gatherum* letter; much in detail, because I think it is the details that make the account of hunting trips interesting. I hope its perusal may not bore you, but interest you as much as the recalling of its incidents has interested me.

You have seen several mentions made of Four Bear Creek. The name was given it for want of a better one by the U. S. Land Surveyors, who happed to be in camp on Hell-Roaring River, near the creek's mouth, on the night in which I killed four bears, the last about 9:30 o'clock at night. Some time I may write you an account of it. Your friend, P.

IN THE FORESTS OF NEW BRUNSWICK.

IV.

IT is about the end of the first week in October, on a Sabbath morning, that I sit alone in the door of my camp close to the shore of the Little Southwest Miramichi Lake. Flies buzz around my head, while the warm wind sighs among the topmost boughs of the tall pines which overhang the lake. Nature has no sound like this, so soothing yet so sad. A little to the west of my seat the sun shines through the pointed top of a tall white spruce, making its leaves appear as if of silver spray, while looking through the dense and darker foliage of the trees which stand to the north I get occasional glimpses of the blue waters of the lake. The wind is dying away, and I hear no sound but the low plash of the waves as they lazily touch the rocky shore, or the mellowed roar of the distant rapids in the stream. The sickly yellowish green of the leaves of the white birches around me bear witness to a departed summer, as does the brownish red foliage of a cluster of mountain ashes, whose bright red berries have lured more than one partridge to its fate at our hands.

On Monday morning I take the same seat, but how changed is the scene. The center of the lake is all ice, for the night had been very calm and cold. I see but two living things near me—one a chipadee, hopping from bough to bough over my head, every now and then venturing nearer so long as I remain motionless, his note always the same *chip-a-dee-dee-dee*, a sound of greeting more than an evidence of affright; and in an unfrozen part of the lake is a solitary little grebe seeming to revel in the unwonted coldness of its waters, as from time to time he plunges beneath the surface.

During the absence of the rest of the company the cook and myself had not gone very far from our camp. Three days had passed but neither men nor canoe had made their appearance; and it was with a good deal of pleasure that early on the fourth we saw a man among the bushes on the opposite side of the lake, which was again free frem ice. He called to us, and the cook, taking a catamaran which he had made, crossed over to him. As they were crossing others followed, and after a little the canoe with two men in it came in view. The man who had just crossed the lake (Mr. Patchell) had in a bag on his back about fifty pounds of caribou meat. It seems that when the advance party were looking for surveyor's marks not far below the outlet of the Little Southwest Lake, a cow caribou trotted up to one of the party who had a gun charged with buckshot, with which he fired at and killed her. This meat came in good play, as they were short of provisions, and they at once proceeded to dress the animal and to cut the flesh from the bones, and as they had no salt they cured it by smoking. This is done as follows: Four stakes are driven into the ground; upon them is placed a frame work of fir (*Abies picea*), a wood which does not communicate a flavor to food. On this the strips of flesh are placed, while underneath them a smoke is made. The flesh is turned from time to time, so that it may be completely penetrated by the smoke. Should the weather become damp the meat can be protected by a covering of birch bark. When cured in this way it will be good for months in warm weather, and without the addition of salt.

Our advance party had seen abundant signs of beaver, and they had seen also some very large sea trout on their spawning beds. Our work connecting the surveyors' lines was soon completed, the chief difficulty having been to find the marked trees indicated on our plans. When work was finished I ascended to the top of a high hill looking north, from which I could see an extensive forest-covered valley bounded on the west by the Cow Mountains, and on the north by the great range of hills on the head of the Nepisiguit River, some of which are over 2,000 feet high. In this distant and secluded valley moose and caribou are yet abundant, while in the streams salmon abound. I doubt if one was ever taken here by means of a fly; trout at the proper season can be caught here with any kind of bait. I have caught quantities of them from a great boulder which lies at the mouth of the large stream emptying into the Little Southwest Lake from the west, with a hook to which was fastened a piece of red flannel by way of bait.

Turning our faces homeward we took the log canoe, which we had made, a mile and a half up the stream, leaving it at the head of the dead water, where the moose had visited us, we hauled it out over a log so that it might not be carried away in the spring by the ice.

On our first day's journey we got a beaver in a trap which we had set along the edge of the stream as we came down it. This animal was soon killed and I could not but regret the poor thing's fate, as it turned its gentle eyes toward me. I could not taste the meat when it was cooked at night.

As evening drew on some of the party who had gone ahead pitched our little cotton tent where we had placed it before, making use of the same boughs we had used on our former visit to the same spot. We soon had a blazing fire in front of two large spruce logs which would reflect the heat directly into the tent. There is nothing so good when one is camping out as to have good high back logs, and if you can build your fire on a slight eminence where it will be a few inches above the level of the berth, you will get the whole benefit of your fire. We had left behind one of our pardy, Henry, to paddle up the dead water on a catamaran.

Night closed in and the bright stars twinkled in the clear cold air, and Henry had not yet made his appearance. Our Abenaki boy Frank got uneasy about him, and began to whoop, but got no reply except that of *koo-koo-kus* (the owl) as he called him. An hour passed and still no Henry. One did not like to say that he was uneasy to the other. At last Frank said: "Dan, let us go out and meet Henry;" and so off they started with birch bark torches, and more bark under their arms to replenish the light. Time seemed long to the rest of the party, as we gathered around our bright fire. "Let us have tea ready for them when they come," suggested one to the cook, who had his pork hissing merrily in the frying-pan and water boiling in a large tin kettle.

Still no Henry appeared. By the uncertain glare of the flickering fire I wandered off almost unconsciously to the top of a little eminence not far from the tent and seated myself on a fallen tree. I had not been musing there long before I heard the sound of voices and saw the reflection of the light from the returning torches on the tops of the distant trees; and I was relieved to see three persons returning. Frank had two splendid black ducks in his hand, while Dan carried over his back a fine otter which Henry had caught at the "Jaws." He had brought down four black ducks at one shot, but had only secured two of them. The next morning we were up bright and early, making our way out of the forest in which we had been for more than a month. Three days' travel brought us to the first house. Our trip was made as timber explorers, and not as hunters. We took of game, 75 partridges, 17 black ducks, 1 beaver, 1 caribou and 1 otter. Besides these our party, or some of them as we were wandering through the woods examining the trees, saw 3 moose, 4 caribou, 4 beavers and 2 bears; this will give an idea of the game which is to be found in the great forest which covers the interior of the province of New Brunswick and which would make the best park for a game preserve of any place to be found in Eastern America, as the soil is too stony for cultivation, while it abounds with streams, lakes and dead waters.

EDWARD JACK.

PICTURES IN THE FIRE.

ON the hearth in front of the cavernous old fire-place there are two pairs of slippers. One pair is of buffalo skin, rough-looking but very, very comfortable, as slippers ought to be, for their wearer never attempted to insert a number nine foot into a number six slipper. The other pair are unquestionably French both in material and fashion, and as for dimensions they are almost as small as any Cinderella's—and that's an honest admission and exception that the second pair of slippers would awfully hate to make.

A good dinner and an after-dinner smoke with a pleasant chat before a blazing fire sometimes superinduce a feeling of drowsiness, especially if the chat halts too frequently and gives one the opportunity to go wool-gathering, which Little Slippers allowed during the lull in the harmless gossip. Big Slippers was far away in dreamland, and that country, this trip, was the land of spruce and hemlock, rippling streams and quiet lakes.

It is pleasant when you can sit by your own fireside and go a-fishing and oft times catch as many fish as if you were really among the hills and lakes and streams, up to your knees in the purling brook and making your finest casts. You are safe from rheumatism at any rate, and can help your fancy to lead you into believing that the sound of the roaring red blaze whirling up the ample chimney is the soughing of the wind among the pines, the sparks that drop from the crackling logs are the gleaming of the stars, the angry flash at the gathering flames is the upward dart of a trout, the smoke that whirls "forninst" the andirons are the scudding clouds, and the shifting, changing shadows among the chairs and tables are the gleams of moonlight that pierce their way through the pines, while the old clock in the corner is the woodpecker beating his solitary reveille. It makes a fellow feel for a while as though he would like to live his life in dreamland, with the outside world only an idea.

There are pictures in the fire, but "the open fire-place does not kindle the imagination so much as it awakens the memory; people become reminiscent in front of it," and to-night its ruddy blaze recalls the face of the absent-minded doctor, the gentle charming old man with his simple honest ways. Through the mists of years I can recall his oddities and his pleasantries.

As the charming "Back Log Studies" tell us, "To poke a wood fire is more solid enjoyment than anything else in the world. The crowning human virtue in a man is to let his wife poke the fire." Big Slippers claims this virtue, and moreover Little Slippers may get up early in the morning and build the fire; and still more, when the mornings are particularly cold, Big Slippers will insist and demand that she build it, and the colder the morning the more emphatic the demand; in fact it becomes a positive order. What an admission, "The crowning human virtue," umph!

How the old doctor did love to fuss around a camp-fire. Poking it here, tossing a stick there, pulling down one over yonder, and pushing back any burning embers that had fallen outside the proper bounds. He went at a camp-fire much as he would at a patient whose malady was difficult of diagnosis, and did it as carefully. I am afraid that notwithstanding the many good qualities of the doctor he lacked the "crowning human virtue," but he would perhaps excuse himself with the plea that his wife did not understand poking a fire any better than she did writing a prescription.

In his office or at the camp-fire, the doctor was never caught napping, but in all other places how dreary and abstracted he sometimes became. We were once trolling with him on the lake. It was a lazy afternoon and the doctor tied the end of his line to one of the oar locks and picking up a piece of wood whittled on it until it was cut away to his hand, and then throwing his knife into the lake put what remained of the stick into his pocket. The fishing being over, the doctor hauled in his troll and wishing to cut his line close up to the spoon, he pulled out the piece of wood and without looking at it began to pick away at it, trying to find the blade; and only after repeated failures did he look at the bladeless wood and instantly the fate of the knife was recalled to his mind; and he begged, "Now please don't say a word about this to the boys." Every day there was some absent-minded break to be charged to his account.

Putting on my dreaming cap is the only way I can go a-fishing now. I am sure the surroundings are in sympathy. There is one of my old rods that "could a tale unfold" by proxy. It's quite an ornament here, though of no present nor prospective use. It's here as a gentle reminder of other days. Well do I remember the early morning when it made its debut on the Andirondack stream, and a wonderfully successful first appearance it was.

It was a likely morning for fishing and all alive with woodland sounds and movements. In a pool below a fallen tree and a large rock by which the water went whirling in a little maelstrom of unrest its first casts were made. The place was doubly attractive from the probabilities of its haboring some trout grandees and the possibility of an angler's breaking his neck in attempting to capture them. What higher recommendation could one give to a trout pool?

Further and further the rod carries the red ibis stretcher and the now forgotten dropper; then at the momentary gleam on the surface as though there was an electric system of intercourse between fly and wrist—the hook was placed, and quicker than the telling came the excitement of doubt, hope and pleasure. A novice might as well have engaged in a sparring match with a buzz-saw, but before that little pool was exhausted we had a creel almost full of trout comfortably taking their last sleep in a bed of cool green ferns.

Suddenly one of those little slippered feet touches my foot and a sweet voice telling me to wake up brings me back from the dreamland.

MILLARD.

BEAR CREEK, Wyoming.

A STRUGGLE WITH A BUCK.

Editor Forest and Stream:

Your correspondent "S. A.," issue Dec. 10, doubts the correctness or truth of the press dispatch relating to the antics of a pet buck. In this connection a relation of my experience with a tame buck might prove interesting. Mr. John Ellis, of East Coventry, Chester county, Pa., on one of his annual hunting trips about eighteen years ago, secured two fawns, a buck and doe. He constructed a pen for them by inclosing about half an acre of groand with a clap-board fence, nine feet high. Along one side of the inclosure was an old blacksmith shop. Occasionally an ambitious hound would jump on the roof of the shop, run up half way to the peak and jump down inside of the deer pen. Then the deer would jump out over the fence and an exciting chase would result if the dog succeeded in getting out of the inclosure. On one occasion they were driven as far as Pottstown, four miles from the Ellis farm.

In the course of two or three years they had grown to a fair size and waxed fat. The buck sported a fine pair of antlers. I cannot say how many prongs there were on those antlers; but I am willing to testify that they were sharp-pointed. Of this fact the buck gave me a very pointed reminder one fine evening in October about sixteen years ago. My father's farm joined the Ellis property. It had become a very common occurrence to see the deer close to our buildings, in the front yard, and elsewhere. An open gate was generally ignored. The nearest way was over the fence. One day my four-year-old brother was playing on the lawn and the buck attacked him, rolling him over with his antlers. The child's screams brought a half a dozen carpenters, who were at work near by, to his assistance. The deer were driven away and my brother was found to be more frightened than hurt.

A few days later I came home in the evening from school, and saw the deer on the lawn. I went into the house with my empty lunch basket, and then returned to look at the deer. I thought I would have revenge on that buck. I would get a whack at him and then see them run. I picked up a small stick and, holding it behind me, advanced toward the deer, holding out my left hand and calling the buck by name. He met me half way, and instead of raising his head for a caress, as he usually did, he suddenly lowered his head and charged on me with all his strength. To say that I was surprised is putting it very mild, but I did not lose my presence of mind for a moment. I dropped the bit of wood I had in my hand and grasped the buck by the antlers. He acted on the offensive, I on the defensive. He shoved me around as though I was a feather weight. I was nineteen years of age, was "born and raised" on a farm, and had wrestled with every kind of domestic animal commonly met with on farms, from a rabbit up to a bullock; but this was a new experience to me. If it had been a butting ram, or a cross boar, I would have thrown it down and sat upon it; but this buck was having the liveliest kind of a circus with me.

There was about two inches of snow on the ground, and I could not get a good foothold. The buck shoved me backward rapidly until I struck a barrel of cement, weighing, probably, between three and four hundred pounds. This barrel was overturned, and I fell flat on my back. I still kept my grip on his antlers, for I felt that my life depended on my doing so. He then shoved me several yards further, when I threw my legs up around his body and got my feet hooked together above his back. My weight was too much for him. He fell. We were both down. I was mostly under, but I had one leg on top. Then he gave vent to a loud and long drawn out bleat. His mouth was close to my ear, and that bleat I shall never forget.

Then I called for help. My strength was deserting me on account of the constant heavy strain on both arms. I was hugging his head close against my breast, and my legs were locked round his body. A better hold of him I could not possibly have had. Every few moments he would struggle for liberty, would strike at me with his sharp hoofs, try to gouge me with his antlers, and *b-a-a-a* in my left ear.

Finally assistance arrived. Zenas M. Savage was first on hand, he having ran about four hundred yards at near his top speed. "What shall I do?" said Mr. S. "Kill him, kill him," said I. He could not approach very near, as the buck was striking out viciously in nearly every direction with his sharp hoofs. Then Moses Fox, the one-eyed rabbit hunter, arrived. Then Mr. Ellis, the owner of the deer. He had been crossing a strip of woodland one hundred rods away when he heard my call for assistance. Seeing the doe making a bee line for home, he suspected what was causing the racket. Several other neighbors soon arrived; also my brother, who was in the barn seventy-five yards away and had not heard anything. A long rope was procured, the center of which was attached to the buck's antlers, and several men taking hold of the ends of the rope, I was quickly relieved of my most worthy antagonist. My struggle with

the buck had lasted not less than twenty minutes, and during that time he did not show the slightest sign of weakening or giving up. Mr. Ellis and Mr. Fox led the deer home, each holding an end of the rope and preventing the buck from attacking either, although he made several attempts to do so, and came near throwing them to the ground on several occasions. The buck was tied up to a post and his antlers sawn off.

The deer were sold to a gentleman in Philadelphia and I never saw them again. During my struggle with the buck I received no assistance until after the rope was attached to his antlers, except the moral support of those present, who urged me to try to hold him a few minutes longer. The buck's tactics was to get in all the work possible with his antlers, and strike vicious and cutting blows with his feet, the front ones being used with great facility and power. I would advise any one who contemplates a fight with a full-grown antlered buck, single-handed and without weapons, to first estimate the strength and staying powers of his adversary, quadruple that, and then ask himself seriously whether or not he has any business to take the contract.

THE A. O. U. CHECK LIST.

THE report of the Committee of the American Ornithologists' Union, appointed to consider the subject of the classification and nomenclature of North American birds, is in press, and is soon to be issued. In many respects, it will be a surprise to those interested in birds, who have not kept up with the progress of recent events in ornithology and its change of order, beginning with the lowest forms of bird life and ending with the highest, will seem at first sight strange, though all must acknowledge that is is the natural order to follow. The report consists of two parts, of which Part I. is the new code of nomenclature recently adopted by the Union. This is an elaborate exposition of the rules of nomenclature by which the Committee was guided in deciding the names of North American birds as given in the accompanying check list. Part II. is a classified list of North American birds, giving the names of the higher groups, as well as of the species and subspecies, from subgenera to orders. The names of the genera and subgenera are accompanied by references to the work or paper in which they were first established; the names of the species and subspecies are followed by a citation of the publication where they were first described, and of the authority (when not also the original describer) who first used the name as adopted in the list. A concordance is given of the previous check lists, as Baird's (1858), Coues' (1872), Ridgway's (1880), and Coues' second list (1882); to which is added a brief statement of the geographical distribution of each species and subspecies, with special reference to its North American range. The list, besides being the "latest," and an authorized "standard" list, embraces two features not found in any previous list of North American birds, inasmuch as it gives the classification and habitat of each bird included. The code and list is the result of the expenditure of much time and research on the part of the committee during the last two years. In many respects the list will doubtless prove more satisfactory, and in some ways of far greater utility, than either of its several excellent predecessors. The work, making an octavo volume of about 300 pages, is printed on fine paper, and no care has been spared to make it typographically attractive and accurate. Price, in full cloth, $3, postpaid.

ARCTIC OWL IN MICHIGAN.—One morning last week a man, living about two miles from this village, was going before daylight to the house of a neighbor, when his attention was attracted by the movements of a creature of some sort moving away from the barn toward the forest and dragging some object through the snow. He thought it was a dog, and investigated, when to his surprise it proved to be a large bird. Procuring a gun from the house he went back, and the bird attempted flight, but was so loaded with the loose snow that it did not succeed. It then faced the man, who fired and killed it. It proved a fine specimen of the Arctic owl, more than five feet from tip to tip. It had caught a tame duck at the barn and partially devoured its prize, and would probably have finished its meal had it not been interrupted as above stated. I have never seen one of these birds hereabout, and old woodsmen who have spent some years in the neighborhood say the same.—KELPIE (Central Lake, Mich., Dec. 15).

PROTECTION OF NORTH AMERICAN BIRDS.—The committee of the American Ornithologists' Union, appointed to take measures for the protection of North American birds and their eggs, met for organization Dec. 12, and will proceed at once to collect information on this subject. The permanent chairman of the committee is Mr. G. B. Sennett, and the permanent secretary Mr. E. P. Bicknell. The objects of the committee commend themselves to a large class of the readers of FOREST AND STREAM, and we presume that many of these readers have very decided views on this matter. We hope that such as have opinions will give us their views on the matter. It is only by a thorough agitation of the subject that a public sentiment condemning the wholesale slaughter of our songsters can be aroused, and until this sentiment takes shape and finds expression there is little hope of accomplishing much for bird protection. Let the lovers of the birds speak out.

ENGLISH HARES ON FISHER'S ISLAND.—The members of the Fisher's Island Club report that they have found scattered over the island a number of dead English hares. All of them were torn in half, just as if pulled apart by the fore and hind legs. They say that their preserve is free from ground vermin, that they have noticed several hawks, but do not believe that they were the destroyers.—X. Y. Z.

THE GROUSE'S DRUMMING LOGS.—*Editor Forest and Stream:* Will any of the readers of your paper give their experience as to the position of the logs on which the ruffed grouse drum. My observation is that they prefer logs lying north and south.—KEOUK.

Game Bag and Gun.

"Forest and Stream" Trajectory Test.

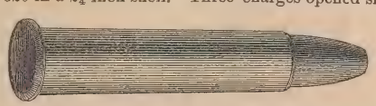
(*Continued from page 407.*)

Marlin .38.

The Marlin .38 55-255 was tried at both distances of the test, and with very uniform results. The weapon weighed complete 9 pounds 1½ ounces, and had a 28-inch octagonal barrel, weighing 4 pounds 8 ounces. The shop mark was 10,909. The rifling was uniform, with a twist of one turn in 20 inches. The six grooves have each a depth of .003 and a width of .138 inch. The loading was with ammunition coming from the U. M. C. factory, and when opened the

powder was found to be pressed quite hard, but in fair condition otherwise. The bullets had four grooves. The three powder charges weighed each 52 grains exactly, and the three bullets ran 254 8, 254 5 and 254 5 grains.

The 200-yard test was made on Sept. 30, and when the rifle was placed in the rest at 2:20 o'clock in the afternoon the wind was going down the range from the 6 o'clock quarter at 12 miles per hour. The barometer stood 30.02 inches, the dry thermometer 79.4° and the wet-bulb thermometer 68°, indicating a dew point of 60.6 and a humidity in the atmosphere of 53 per cent. Under these conditions the 200-yard record stood



Round.	50 Yards.	100 Yards.	150 Yards.
1.....	8.414 in.	11.814 in.	9.118 in.
2.....	8.473 in.	11.939 in.	9.191 in.
3.....	8.300 in.	11.683 in.	9.013 in.
4.....	7.978 in.	11.216 in.	8.719 in.
5.....	8.117 in.	11.435 in.	8.769 in.
Average....	**8.256** in.	**11.617** in.	**8.962** in.

At 100 yards the trial was made on Oct. 10 at 3 o'clock in the afternoon with a 9 o'clock wind blowing 6 miles per hour. The barometric pressure was 30.240 inches, the dry thermometer 66 5° and the wet-bulb thermometer 55.5°. This would show a dew point of 44.5 and a degree of humidity in the atmosphere of 45 per cent. The 100-yard heights in the trajectory line stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	2.159 in.	2.646 in.	2.208 in.
2.....	2.190 in.	2.639 in.	2.208 in.
3.....	2.147 in.	2.695 in.	2.240 in.
4.....	2.098 in.	2.549 in.	2.179 in.
5.....	2.076 in.	2.522 in.	2.174 in.
Average....	**2.134** in.	**2.610** in.	**2.202** in.

Remington-Hepburn .38.

The Remington section of our armory for trial contributed this arm, which was put on the rest for the 200-yard trial Sept. 30, at 11 o'clock in the forenoon. The wind at eight miles per hour was coming from the 1 o'clock quarter, while the barometer stood at 30.070 inches, the dry thermometer at 80°, the wet-bulb thermometer 69.8°, indicating a dew point of 63.6 and a humidity in the atmosphere of 57 per cent. The arm had a 30-inch half octagon barrel and was numbered 6,082. It had a total weight of 9 pounds 7½ ounces, and a barrel weight reported at 6 pounds 8 ounces. The rifling had a uniform twist of one turn in eighteen inches, and the five grooves had a depth each of .0035 inch and .150 inch wide. The loading was with Remington made ammunition, .38 50-320 in a 2¼-inch shell. Three charges opened showed

charges of hard pressed powder in fair condition, and weighing 52.45, 51.4 and 50.6 grains, while the four-grooved bullets corresponding weighed 322.8, 322.8 and 322.7 grains. The 200-yard record stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1.....	8.601 in.	12.081 in.	9.142 in.
2.....	8.947 in.	12.554 in.	9.479 in.
3.....	9.055 in.	12.676 in.	9.577 in.
4.....	8.984 in.	12.596 in.	9.543 in.
5.....	8.677 in.	12.135 in.	9.115 in.
Average.....	**8.852** in.	**12.408** in.	**9.371** in.

The 100-yard trial came on Oct. 12, at 4 o'clock in the afternoon, with the wind coming from the 3 o'clock quarter at twelve miles per hour. The barometer marked 30.285 inches, the dry thermometer 55°, and the wet-bulb thermometer 51.2°, showing a dew point of 47.4 and the humidity in the atmosphere as 75 per cent. The record of trajectory heights stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	2.231 in.	2.837 in.	2.280 in.
2.....	2.239 in.	2.771 in.	2.339 in.
3.....	2.292 in.	2.819 in.	2.254 in.
4.....	2.257 in.	2.739 in.	2.275 in.
5.....	2.111 in.	2.704 in.	2.195 in.
Average.....	**2.226** in.	**2.774** in.	**2.289** in.

Bullard .38.

This weapon came with the line of rifles from the Bullard works, and gave much trouble in the testing, owing to the obstinacy of the carrier block. It had a half octagon 26-inch barrel and was marked No. 1675. The entire rifle weighed

8 pounds and the barrel was marked as having 3 pounds of metal in it. There were five grooves with a uniform twist of one turn in 22 inches, the grooves being each .005 inch in depth and .140 inch in width. The loading was with a .38-45-190 cartridge of U. M. C. make. When opened three charges from the lot in use showed the powder in fine condition and weighed 45.7, 44.6 and 45.4 grains in the three charges. The bullets with double groove weighed respectively 188.6, 188.4 and 188.5 grains. The 200-yard firing of the weapon took place on Sept. 29, with the wind blowing from the 6 o'clock quarter at 7 miles per hour. The other weather conditions stood: Barometer, 30.201; dry thermometer, 77.2°; wet bulb thermometer, 69.8°, giving the dew point 65.4 and the humidity 77.2 per cent. Under trial the weapon made the following record:

Round.	50 Yards.	100 Yards.	150 Yards.
1.....	8.977 in.	12.673 in.	9.840 in.
3.....	9.105 in.	12.814 in.	9.870 in.
4.....	8.972 in.	12.710 in.	9.834 in.
5.....	8.961 in.	12.790 in.	9.938 in.
8.....	8.756 in.	12.470 in.	9.723 in.
Average.....	**8.954** in.	**12.691** in.	**9.851** in.

At 100 yards the rifle refused to act, and the carrier block brought the entire action to a stop. It was an instance of one of those occasions when even the best arm takes on an ugly fit and seems to have an intelligent obstinacy. Without tools to take the rifle apart and ease the action, there was nothing to do but set it aside and deprive our record of the 100-yard test.

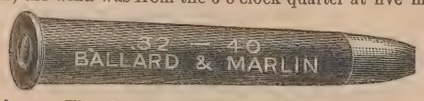
Stevens .38.

This is the first of the Stevens make of rifle to come under notice. The arm has a 26-inch, half-octagon barrel, and was numbered 12,950. It weighed 7 pounds 2 ounces, with a barrel weight of 4 pounds 5 ounces. The twist of the rifling was uniform, having one twist in 18 inches, with six grooves. The loading was with U. M. C. ammunition marked .38-40-145. When opened the bullet was found with one groove,

and three of them weighed 145.7, 145.6 and 145.3 The powder, in fine condition, weighed in the three cartridges 38.7, 38.1 and 39 grains. The rifle gave the same trouble as all the other tip-up barrels when put in the rest, and consumed much time in making the tests. It was put on the rest for 200-yard testing Oct. 19, with the barometer standing 30.250 inches, the thermometric recording being with the dry-bulb 59° and with the wet-bulb 38.5°, denoting a dew point of 58 and a humidity in the atmosphere of 96 per cent. It was half-past 7 in the morning when the test was made and the wind blew from the 6 o'clock quarter at two miles per hour. The longer ranges record stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1.....	9.262 in.	13.162 in.	10.302 in.
2.....	9.311 in.	13.318 in.	10.056 in.
3.....	10.088 in.	14.757 in.	11.718 in.
4.....	8.963 in.	12.596 in.	10.078 in.
5.....	9.469 in.	14.105 in.	11.308 in.
Average.....	**9.419** in.	**13.588** in.	**10.692** in.

For the trial at 100 yards the weapon was placed in the rest on Oct. 12, with the wind coming at fourteen miles per hour from the 2 o'clock quarter. The barometer reading was 30.285 inches, the dry thermometer at 57° and the wet-bulb ditto at 53°, making the dew point 49 and the humidity of the atmosphere at 74 per cent. Under these conditions and with ammunition as before noted, the record stood:



Round.	25 Yards.	50 Yards.	75 Yards.
1.....	2.190 in.	2.701 in.	2.291 in.
2.....	1.999 in.	2.616 in.	2.303 in.
3.....	2.051 in.	2.673 in.	2.262 in.
4.....	2.000 in.	2.558 in.	2.227 in.
5.....	2.087 in.	2.547 in.	2.220 in.
Average.....	**2.065** in.	**2.619** in.	**2.261** in.

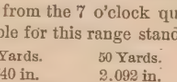
Marlin .32.

This is the last of the series of Marlin arms sent from the New Haven armory. It behaved very well in the test and was readily tested. The weapon had a 28-inch octagonal barrel and complete weighed eight pounds, while the barrel alone weighed three pounds one ounce. The rifling was of uniform twist, one turn in sixteen inches, and each of the six grooves was .003 inch deep and .102 inch wide. The loading was with U. M. C. .32-40-165 ammunition. When examined the powder was found to be pressed very hard, so much so as to crush the powder grains nearest the bullet, beyond this the powder was good. The bullet had four grooves, and had a composition of 1 tin to 20 lead. Three powder charges weighed 43.2, 43.8 and 42.7 grains, while

the corresponding bullet weights were 164.2, 164.0 and 164.2 grains.

When tried at 200 yards on Sept. 30, at 5:20 in the afternoon, the wind was from the 6 o'clock quarter at five miles

per hour. The thermometer registered 30.006 inches, and the dry and wet thermometer readings were 68.5° and 64° respectively. This shows a dew point of 60.8, and the humidity in the atmosphere as 77 per cent. The long range trajectory table stands:



Round.	50 Yards.	100 Yards.	150 Yards.
1	6.833 in.	9.660 in.	7.495 in.
2	6.983 in.	9.895 in.	7.675 in.
3	7.236 in.	10.288 in.	7.922 in.
4	7.374 in.	10.450 in.	8.111 in.
5	7.255 in.	10.386 in.	8.050 in.
Average	**7.163** in.	**10.135** in.	**7.850** in.

At 100 yards out of the same lot of ammunition the trial came on at 5 o'clock in the afternoon of Oct. 5, with the thermometer standing at 30.160 inches, the dry thermometer at 57° and the wet-bulb thermometer at 50.5°. The dew point in this case was 44 and the humidity at 62 per cent. Wind was coming from the 7 o'clock quarter at ten miles per hour. The table for this range stands:

Round.	25 Yards.	50 Yards.	75 Yards.
2	1.740 in.	2.092 in.	1.762 in.
3	1.794 in.	2.145 in.	1.821 in.
4	1.735 in.	2.043 in.	1.851 in.
5	1.867 in.	2.311 in.	2.036 in.
6	1.728 in.	2.050 in.	1.870 in.
Average	**1.773** in.	**2.128** in.	**1.868** in.

Stevens' Hunters' Pet.

This rifle we were particularly anxious to have in the test, because it is pushed as being an accurate weapon at 40 rods, and also in deference to the requests of many correspondents who were anxious to know what the little pop was capable of in comparison with the heavier arms. The weapon used was of the center-fire model, with an 18-inch octagonal barrel and the usual skeleton stock. It was marked 2,715. The weight of the arm complete was 5 pounds 2½ ounces, while without the stock its weight was 4 pounds 6½ ounces. The barrel-weight is given as 2 pounds 12 ounces. The rifling was uniform, with six grooves making one turn in 18 inches. The loading was with Winchester-made ammunition, .32-9-85. The powder in the opened cartridges was found in fine

condition, and the bullet with one groove had a composition of 20 lead to 1 of tin. The cartridges were labeled ".32 S. & W., C. F.," being those intended for the Smith & Wesson revolvers, but adapted to the chamber of the Hunters' Pet rifle. Three charges weighed 8 4, 8.7 and 8.4 grains, while the corresponding bullets were 84.6, 85.1 and 84.5 grains.

The trial at 200 yards was made on Oct. 19, at 3 o'clock in the afternoon, and was a sore test of the patience of the experimenter. The shortness of the barrel made it necessary to have considerable building out on the rest to bring the muzzle over the measuring stake, and then the shots flying wild compelled the firing of nearly a score of test shots before five were put through all the screens and on the target. At the time of the test the wind was from the 5 o'clock quarter at 22 miles per hour, with the barometer 30.205 inches, the thermometer 63.2°, the wet-bulb thermometer 58°, giving a dew point of 53.8 and a percentage of humidity of 72. Under these conditions the test stood as follows, and here, as in every other case, the numbers under the head of "round" indicates the order in which the effective, counting shots were made. Other shots went through one or two of the screens, but were not complete enough to measure up.

Round.	50 Yards.	100 Yards.	150 Yards.
2	15.832 in.	21.969 in.	16.730 in.
8	15.258 in.	21.760 in.	17.091 in.
13	15.416 in.	21.570 in.	16.505 in.
14	16.066 in.	23.136 in.	17.965 in.
17	15.105 in.	21.503 in.	16.686 in.
Average	**15.535** in.	**21.987** in.	**16.995** in.

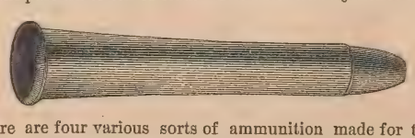
At 100 yards, the trial was more readily made, and the shots followed along with fewer gaps. The test took place Oct. 12, at 3:20 in the afternoon, the wind blowing 13 miles per hour from the 3 o'clock quarter. The barometric pressure was 30.285 inches, the thermometer 57° and the wet-bulb do. at 52°, indicating a dew point of 49 and the humidity in the air at 69 per cent. The trajectory heights stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1	3.819 in.	4.911 in.	3.942 in.
2	3.904 in.	5.120 in.	4.205 in.
4	3.532 in.	4.604 in.	3.968 in.
5	3.833 in.	5.026 in.	3.905 in.
6	4.095 in.	5.114 in.	3.862 in.
Average	**3.837** in.	**4.955** in.	**3.976** in.

Colt .32.

The only Colt in the trial, and a snug little arm—one of the newer make of weapons from the Hartford company. It is the new Lightning Colt, with the trombone motion in working the breech action. The weapon weighed 7 pounds 4½ ounces, having a round 26-inch barrel, and was numbered 7048. The barrel weight was 3 pounds 6 ounces, and the rifling had a uniform twist of one turn in 24 inches, and each of the six grooves was .004 inches deep and .070 wide.

The loading was with U. M. C. Co. ammunition. The cartridges are made specially for this arm, having a 20-grain charge behind a 100-grain pure lead bullet. In the opened cartridges the powder was found in fine condition, and three charges weighed 19.8, 19.6 and 19.5 grains, while the one-grooved bullets corresponding were 99.7, 100.1 and 101.2 grains in weight. The 200-yard trial took place Sept. 29 at 1 o'clock P. M. The barometer stood at 30.180 inches, the dry thermometer at 76.7°, the wet-bulb thermometer at 70°, showing a dew point of 65.9 and the humidity in the atmosphere at 69 per cent. of saturation. The wind came from the 7 o'clock quarter at seven miles per hour. The trajectory heights ran:



Round.	50 Yards.	100 Yards.	150 Yards.
1	9.546 in.	13.554 in.	10.722 in.
2	10.080 in.	14.380 in.	11.107 in.
3	9.515 in.	13.700 in.	10.635 in.
5	9.780 in.	13.996 in.	10.859 in.
6	9.496 in.	13.622 in.	10.542 in.
Average	**9.683** in.	**13.550** in.	**10.773** in.

At 100 yards the trial came on at half-past 2 on the afternoon of Oct. 10, with the wind from the 9 o'clock quarter at ten miles per hour. The barometer stood at 30.220 inches, the dry thermometer 67°, the wet-bulb thermometer 55.2°, showing the dew point at 43.4 and the humidity at 43 per cent. Under these conditions the 100-yard trajectory table stands:

Round.	25 Yards.	50 Yards.	75 Yards.
1	2.450 in.	2.948 in.	2.542 in.
2	2.239 in.	2.809 in.	2.370 in.
3	2.356 in.	2.967 in.	2.552 in.
4	2.218 in.	2.802 in.	2.340 in.
5	2.320 in.	2.917 in.	2.483 in.
Average	**2.316** in.	**2.899** in.	**2.453** in.

Remington-Hepburn .32.

This arm is one of the new output from the Ilion armory and was an admirable close shooter. Its side snap action, of the Hepburn patent, made it as convenient as a Springfield in the rest. The barrel was a 28-inch, half octagon and marked 6097. Its full weight was 7 pounds 11½ ounces and of the barrel 4 pounds 8 ounces. The rifling was of uniform twist, having one turn in 16 inches. There were five grooves, each .003 inch deep and .110 inch wide. The loading was with Remington made ammunition, using Hazard FFG powder, 40 grains, and a three-groove bullet made up of one part tin to ten of lead. The shell waa 2⅛ inches long.

There are four various sorts of ammunition made for this arm, each with 40 grains of powder, but with 125 and 150 grains grooved and 150 and 175 patched bullet respectively. The test was made with the first named. Though had not the chronic excuse "out of that ammunition" been given when one messenger went to purchase other cartridges, we would gladly have made the test with the heavier bullet as well. The powder was found in fine condition and when weighed up three charges showed 40.2, 40.7 and 40.8 respectively, while the bullets were 118.5, 119.2 and 120.5. The 200-yard trial came at 10:40 on the morning of Sept. 30 with the wind coming from the 10 o'clock quarter at 7 miles per hour. The barometer stood 30.08 inches, the dry thermometer 79° and the wet-bulb thermometer at 69°, while the dew point of 63 indicated a humidity of 58 per cent. With these weather environments the figures at this range stand:

Round.	50 Yards.	100 Yards.	150 Yards.
1	6.119 in.	8.717 in.	6.856 in.
2	6.123 in.	8.680 in.	6.757 in.
3	6.600 in.	9.233 in.	7.312 in.
4	6.445 in.	9.056 in.	7.078 in.
5	6.205 in.	8.766 in.	6.820 in.
Average	**6.298** in.	**8.890** in.	**6.964** in.

For the 100-yard test the rifle was put on the stand Oct. 10, at 10 o'clock in the morning with the wind from the 10 o'clock quarter at 10 miles per hour, and the rifle scored a "ten strike." The barometer rose to 30.285 inches, the dry thermometer to 61°, while the wet-bulb thermometer registered 57°, making a dew point of 54 and a humidity of 78 per cent. of thorough saturation of the atmosphere. The trajectory stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.513 in.	1.815 in.	1.544 in.
2	1.477 in.	1.870 in.	1.560 in.
3	1.443 in.	1.770 in.	1.554 in.
4	1.429 in.	1.757 in.	1.477 in.
5	1.478 in.	1.804 in.	1.488 in.
Average	**1.468** in.	**1.803** in.	**1.525** in.

Remington .32, R. F.

Another rifle of the pop-gun order, yet of a class of rifles which finds much sale and evidently enjoys a great popularity among that numerous class who seek small game and wish an arm proportionate. The weapon was of the old Remington model, and used a rim-fire cartridge. It had a 26-inch octagonal barrel, and was marked 767. Its complete weight was 7 pounds, of which 4 pounds 8 ounces were in the barrel. The rifling was of uniform twist, one turn in 20 inches, and the five grooves had each a depth of .003 inch and a width of .110 inch. The loading was with U.

M. C. ammunition, the .32 long rim-fire cartridges, .32-13-90, being used. When opened the powder was found in fine condition, and the three-grooved bullet had a pure lead composition. When weighed three powder charges showed 11.9, 12.4 and 12.2 grains, while the corresponding bullets weighed 88.6, 88.9 and 88.7 grains.

The weather conditions at the time of the test on Oct. 1, at half past 2 in the afternoon showed the wind blowing from the 6 o'clock quarter at 7 miles per hour, while the other readings were: Barometer 30.08 inches; dry thermometer 75.5°; wet-bulb thermometer 63°, indicating a dew point of 53.3, and a humidity of 47 per cent. The heights as calculated stood:

Round.	50 Yards.	100 Yards.	150 Yards.
1	12.562 in.	17.860 in.	13.843 in.
2	12.361 in.	17.597 in.	13.323 in.
3	13.400 in.	18.516 in.	14 291 in.
4	12 585 in.	17.844 in.	13.731 in.
5	13.777 in.	19.171 in.	14.682 in.
Average	**12.937** in.	**18.237** in.	**13.974** in.

The 100-yard trial came off Oct. 10, at 5 o'clock in the afternoon, with the wind coming from the 9 o'clock quarter at 4 miles per hour. The barometric pressure was 30.240 inches, the dry thermometer 59°, and the wet-bulb instrument at 54°, showing the dew point 49 and the humidity at 70 per cent. The heights as deduced from the screens stood:

Round.	25 Yards.	50 Yards.	75 Yards.
1	3.168 in.	3.998 in.	3.257 in.
2	3.063 in.	3.669 in.	3.080 in.
3	3.247 in.	4.036 in.	3.257 in.
4	3.251 in.	4.284 in.	3.442 in.
5	3.041 in.	3.852 in.	3.187 in.
Average	**3.154** in.	**3.968** in.	**3.245** in.

Editor Forest and Stream:

To illustrate the wonderful accuracy of our modern ballistic tables, I have calculated the 200-yard trajectory of the Springfield rifle, using the 70-500-grain cartridge. The initial velocity was taken at 1280 f. s. This being about the mean result obtained from a large number of Government observations.

The following table gives the results of these calculations, and for the sake of comparison, the actual trajectory as obtained by your late tests:

	50 Yards.	100 Yards.	150 Yards.
Calculated trajectory	9.344 in.	12.974 in.	9.971 in.
FOREST AND STREAM tests	9.406 in.	12.987 in.	9.956 in.
Difference	—0.063 in.	—0.013 in.	+0.015 in.

It will be observed that the coincidence of these figures is something remarkable. But not more remarkable, I believe, than it would have been in any other case in which the weight, form, and initial velocity of the projectile were accurately known. Unfortunately for the general adaptability of this system, the initial velocity is seldom known with sufficient exactness to insure satisfactory results.

JAMES DUANE.

PHILADELPHIA NOTES.

THE American Ornithologists' Union at a recent congress appointed a committee to devise means to protect North American birds and their eggs. The first active work the committee intends doing is to gather statistics regarding the destruction of birds for millinery purposes, and to further this movement information will be solicited from persons acquainted with the shooting grounds of our coast, especially that of the Atlantic seaboard, and the whole will be embodied in a report and probably published and scattered widely throughout the community. The step taken is a good one, but a little late now to accomplish the good which would have been brought about if undertaken three or four years since. The destruction has already taken place and the fashion for using birds for millinery ornamentation is on the decline and will die itself. Still it is a commendable movement and should be continued in.

Throughout the interior counties of Pennsylvania a good snow remains on the ground, notwithstanding the late mild weather. A crust has formed on the surface which makes it bad for the grouse.

A pair of hybrid mallard and muscovey ducks were shot down the Delaware last week, having come to stool with other wildfowl. I saw these hybrids but can't say if they were a cross of tame mallard and muscovey, or the wild mallard and muscovey.

Canvasbacks are still very scarce at the Havre de Grace and Gunpowder River grounds. HOMO,

DEC. 21.

IRONTON, Mo., Dec. 17.—Game in this section is as plentiful as usual, except squirrels and rabbits, which are not as numerous as in years past. Quail can be found most everywhere. Turkeys are quite numerous and in fine condition. I got one last week, the finest I ever killed. Deer are plentiful, but very wild; I saw several in the last few days.—W. E. B.

WHITE RIVER OVERFLOW.—Beebe, Ark., Dec. 6.—Have just come from a hunt in the White River overflow. We found deer, bear and turkey quite plentiful.—S. D. B.

PENNSYLVANIA GAME AND FISH PROTECTIVE ASSOCIATION.—The movement is not confined to sportsmen, but the hearty aid of farmers and others is desired. The aims as set forth in our application for charter from the State is as follows: (1) The protection of game and fish from unlawful destruction; (2) the increase of game and fish by stocking; (3) the securing of uniform game and fish laws in different States; (4) securing and enforcing of competent laws for the protection of game, insectivorous birds and fish in Pennsylvania; (5) to ascertain and report on the occurrence and abundance of game in the various portions of the State; (6) increase of knowledge concerning the value or detriment to the farmer or horticulturist of birds generally. At a recent meeting for organization John M. Chalfant was elected President, and C. J. Pennock, Secretary. It is desired that the membership be extended as rapidly as possible in order that a report may be made early in 1886 of the game and fish of the State. It is believed this feature of the Association will be of general interest to the sportsman, as full reports are expected from every county. Information will be furnished members in regard to means of access and cost of transportation to points where game and fish are abundant. An important feature of the Association will be the reports on the food supply and occurrence of birds, showing which are of particular value or otherwise. Membership fee is $1. Small yearly dues will entitle members to all reports of the Association. Further particulars can be had by addressing C. J. Pennock, Secretary, Kennett square, Pa. Membership fees may be forwarded to the Secretary or to D. Ducr Philips, Cashier National Bank, Kennett Square, Pa.

THE LATE GEO. H. FERRIS.—*Editor Forest and Stream:* I have read with sorrow the obituary notices of Prof. Rice and Geo. H. Ferris. I had met Prof. Rice but two or three times, and then with pleasure and profit. His death is a real loss to fishculture. The death of Geo. H. Ferris will send a thrill of sorrow through many an old and middle-aged rifle shooter. I visited him several times many years ago in connection with rifle work, and from time to time had correspondence with him. Some of his long-range rifles mounted with telescopic sights, also made by him, were the height of perfection, doing better work than has ever been approached by breechloading arms. His work was not merely for a livelihood, but was a "labor of love" as well. In my own amateur work I received valuable suggestions from Mr. Ferris, who was really the most thoroughly practical gunsmith I ever knew.—MILTON P. PEIRCE (Philadelphia, Pa., Dec. 18).

A "FOREST AND STREAM" CLUB.—Stillwater, N. Y., Dec. 20.—*Editor Forest and Stream:* I have to inform you of the organization of a new gun club, composed of the following members: S. F. Wood, G. P. H. Taylor, Elmer Vandecar, Chas. Kip, Geo. Lansing, Geo Van Vechten, Harvie Ackert and Seth Handy. Dr. Taylor was elected secretary, and the name "Forest and Stream Gun Club" was adopted with much enthusiasm. I need not say that the members are all readers of that ever-welcome journal.—G. P. H. TAYLOR. [With such a name the new club ought to be a model.]

A CANVASBACK DUCK STORY.—A solitary, keen-eyed canvas-back came whistling across Chesapeake Bay toward where two New York gunners were ensconced. "Hole on!" said one of them, fidgetting with his gun. "I'll darn soon settle his hash." The duck came, wheeled over the stools and the enthusiastic sportsman, after firing both barrels saw the bird fade away in the dim distance. "Yer dident settle his hash, did yer?" remarked the other man in a pleasant tone of voice. "No," replied the other contentedly, "he dident have any hash!"

THE ROD AND REEL ASSOCIATION.

PURSUANT to call a meeting of the Association was held in the laboratory of Mr. E. G. Blackford, Fulton Market, on Tuesday the 15th inst., President Endicott in the chair. The president stated that the terms of the officers expire with the year and that as the call had stated that there had been some irregularity in the election of officers at the meeting following the tournament he would say that it was in election of a president. He had talked with Judge McGown before that meeting and told him that it was proposed to make him president, but that while the Judge declined he did it in such a modest way that he merely attributed it to his native modesty. Since the election of the Judge, however, that gentleman had written a letter stating that his duties forbid him to serve as president, but he would always be glad to be of service in the rear rank. The secretary then read the letter referred to, and during the election Capt. William Dunning was called to the chair.

Mr. Robert B. Lawrence proposed Mr. Endicott and he was elected. Mr. Mather then offered his resignation as secretary, saying that he had served for four years and the labor was greater than he could well spare time for, and besides this he wanted to cast occasionally and have some of the fun. That the last tournament had deprived him of joining some friends in the bear hunt and that now no doubt there were several thousand bears marauding the pig pens that would have been meat had he been let loose. A vote on accepting the resignation was taken and "the noes had it," notwithstanding Messrs. Tripler, Mitchell, J. A. Roosevelt, and others spoke in favor of letting up on him. At the suggestion of Mr. Blackford that the secretary might be more resigned to his fate if the members attended meetings more promply and helped with the work, Mr. Poey volunteered to act as the secretary's assistant. The meeting then adjourned. Afterward, Mr. Ed. Eggert talked among the members advocating holding a tournament in the spring.

AN ITEM FOR HON. PROCTOR KNOTT.—Alfred Booth, the great Chicago fish dealer, is preparing to remove his fishing business to Duluth, believing that Lake Superior affords better fishing grounds than Lake Michigan, and Duluth is becoming such a railroad center for connections with the great West that his headquarters will be in Duluth for the fish trade. His famous fast fishing yacht is coming to Duluth so as to enable him to supply the markets daily with lake trout and whitefish.—W. D. T.

NEWPORT FISH AND GAME ASSOCIATION.—Messrs. Thos. Burlingham, Thomas Dunn, Edward S. Hammond, Joseph P. Cotton, Patrick J. Galvin, William H. Hammett and Frank H Wilks and others have formed the Newport Fish and Game Association. The objects of the association are to control the fresh water ponds in Newport and vicinity for the propagation of fish and for fishing, and for the protection of game, and to use every legal means for the fulfillment of these ends. The officers are: President, Joseph P. Cotton; Secretary, Frank H. Wilks; Treasurer, William H. Hammett; Board of Directors—Thos. Burlingham, W. P. Sheffield, Jr., Edward S. Hammond, S. E. Greene, Benj. M. Thurston. The secretary writes: "We have control of the fishing privileges of the Lily Pond, which we have stocked with black bass, and the Almy Pond, which we have stocked with German carp. Both are situated south of the city. We are treating for the control of Nielson Pond, situated about two miles east of the city, on the Second Beach, which we intend to stock in the spring with trout. In the future we shall try to control other ponds and brooks in other parts of the island.—F. H. WILKS, Secretary."

THE ONE SHOT GOT AWAY.—Memphis, Tenn., Dec 14.—A squib recently published in *Puck*, (I believe), seems worthy of a place in "Flickerings." It was to this effect: A fisherman went gunning one day, and when he returned he reported that he had shot five "quail," but one of them got away in the brush. He exhibited the four he had bagged, and in a moment of forgetfulness remarked that the one which got away weighed five pounds —COAHOMA.

Fishculture.

CONNECTICUT SHAD FISHERY.—The damage done to the local shad fisheries by the dam at Enfield, Ct., can hardly be measured. The fishery is practically killed and an earnest effort is being made to have something done in the matter. At the voting precints, to-day, copies of the following petition were being largely signed: To the Senate and House of Representatives, in General Court Assembled: We the undersigned, citizens of Springfield, West Springfield and Chicopee, respectfully represent that the Connecticut River, from the Connecticut line to Holyoke, is now, by reason of the maintenance of the dam at Enfield, Ct., made useless for shad fishery. Massachusetts formerly had 16 miles of water upon which depended large and remunerative fisheries for shad. By the recent raising and maintenance of the dam at Enfield, the entire fish industry upon said river is ruined. We therefore respectfully pray that such action may be taken by the general court as may bring this matter to the attention of the Legislature of Connecticut as may result in some remedy by which citizens of Massachusetts may have restored to them rights of which they have been deprived by the action of a Connecticut corporation.—*Springfield Union.*

LAND-LOCKED SALMON IN NEW HAMPSHIRE.—The Manchester *Union* of late date says: "Charles Gordon, of Ashland, killed with a spear in Squam River, Dec. 9, a handsome land-locked salmon, 34 inches in length, 9 inches in depth, and weighing 15 pounds. He was brought before G. H. Adams, Esq., Wednesday, on complaint of Fish Commissioner Hodge, pleaded guilty and was fined $15 and costs." This item was sent us by Mr. Elliott B. Hodge, of the New Hampshire Fish Commission, who writes: "I send you this to show the extraordinary growth of the land-locked salmon in this State. This fish was a male and of course in poor condition. In September the same fish would have weighed near 20 pounds. It could not have been over nine years old, and may have been much less, as much larger ones from the same (Squam) lake have been taken. I took several thousand land-locked salmon eggs from fish taken in Sunapee Lake this fall. I think that these are the first eggs taken from fish artificially introduced into waters outside of the State of Maine. They have been a success in all waters that are adapted to their habits in this State."

THE ADIRONDACK HATCHERY.—Since the damage to the nets belonging to the hatchery and the prompt action of the Fish Commission in issuing handbills defining the penalties for such trespass, the suspected parties have left the neighborhood. Last week Mr. Hardner, of the Rainbow Lake Hotel, visited the hatchery and showed a paper which he was circulating for the signatures of hotelkeepers and guides, pledging them to aid and protect the work of the State and to try to bring all trespassers and poachers to justice. No doubt this action will tend to repress the lawless vagabonds of that region.

SUICIDE OF TROUT.—*Editor Forest and Stream:* My article in this week's issue was not written as a prize competition. I beg of you, therefore, to cut down that leap of six feet alleged to have been made by those little salmon, for it is too much of a feat by at least five feet for even a prize leaping *fête*. If I wrote it six feet, it is the most surprising penslipping feature of the communication.—MILTON P. PEIRCE (Philadelphia, Pa., Dec. 18).

POINTS WORTH CONSIDERING.

1. Because of the compact style of its typography the FOREST AND STREAM actually contains, weekly, more reading matter pertaining to its chosen field than is found in any similar publication in the world.

2. In general excellence the reading columns of the FOREST AND STREAM are of a higher grade than those of any similar publication the world.

3. Taking into account the amount and the character of weekly reading given, the FOREST AND STREAM is away ahead of any similar publication in the world.

4. If a sportsman wishes a sportsman's paper, he will be better suited by the FOREST AND STREAM than by any similar publication in the world.

"My rod creaked and bent double," a stout red-faced gentleman was saying, "and the birch spun like a teetotum. I tell you if Pierre Chaveau hadn't the presence of mind to grip the most convenient part of my trousers with a boat-hook I should have been dragged into the lake in two seconds or less. Well, sir, we fought 69 minutes by actual time taking, and when I had him in and got him back to the hotel, he tipped the scales, the speckled beauty did, at 37 11-16 pounds, whether you believe it or not." "Nonsense," said a quiet little gentleman who sat opposite, "That is impossible." The first speaker looked flattered at this, and colored with pleasure. "Nevertheless," he retorted, "it's a fact on my honor as a sportsman. Why do you say it is impossible?" "Because," said the other calmly, "it is an ascertained scientific fact, as every true fisherman in this room knows perfectly well, that there are no trout in Mooselemaguntcook weighing under half a hundred." "Certainly not," said a third speaker. "The bottom of the lake is a sieve—a sort of schistose sieve formation—and all fish smaller than fifty pounders fall through." "Why doesn't the water drop through, too?" asked the stout patient, in a triumphant tone. "It used to," replied the quiet gentleman, gravely, "until the Maine Legislature passed an act preventing it."—*Chicago News.*

NATIONAL FIELD TRIALS.

THE DERBY.

FOR the Derby there were eighty nominations, of which twenty-three filled. The running began Friday, Dec. 11, the weather clear and cold. The first brace put down was

SAM STERRETT AND JOE NOBLE.

Sam Sterrett, handled by Tucker, and Joe Noble handled by Avent. They were cast off in the open at 8:45, and went off at a rather slow gait. Then they went into thicket, where Joe drew and pointed a bevy. Going after the birds, Sam got a point, and ordered on pointed again; bird shot at, steady to shot and wing. Moving on, Joe pointed. Sam then pointed a bird that had been marked. They were then ordered up and Sam Sterrett awarded the heat.

PEGJIM AND KING SHOT.

Pegjim, handled by Waters, and King Shot, handled by Zimmerman, were cast off in sedge grass field at 10:25. Pegjim soon pointed. Ordered on King Shot flushed, then pointed, and going on flushed again. In woods he scored another point. Going on he drew to a point on bevy along the edge of a strip of grass, Pegjim not up to back. Birds flushed and shot at, steady to shot. Going across a gully into sedge grass, Pegjim pointed single bird. Then casting off, flushed. They were then ordered up at 12:10 and the heat awarded to King Shot.

GATHLIT AND NORTIER.

Gathlit, handled by McGraw, and Nortier, handled by Short, were cast off in sedge grass at 12:15. They went through grass over a hill; both slow. Nortier had a little advantage in style. Gathlit drew on a bevy, then went on and flushed. They flew into grass, where Gathlit flushed a single bird. Then on the hill Nortier flushed a bird. He then pointed balance of bevy. Gathlit refused to back, went in and flushed. Going after birds, Gathlit pointed. Then Nortier scored a point. Then Gathlit flushed. Taken up at 1 o'clock for lunch. After lunch put down again at 1:45. Nortier soon pointed a bevy in good style. Short flushed and killed: both dogs steady to shot. They were then ordered up at 2:25, and Nortier wins the heat.

MAUD D. AND GATH'S HOPE.

Maud D., handled by Ellison, and Gath's Hope, handled by Rose, were put down at 2:30. After a long tramp Maud flushed a single bird and dropped to wing. Gath's Hope made a cast back and flushed a bevy which the judges did not see. Going on, he pointed a bevy nicely, well backed by Maud. Birds flushed and shot; both dogs steady to wing and shot. Going on, Gath flushed twice in woods. Maud then flushed three times in succession. Then she flushed a single bird. Going on, Gath flushed twice. They were then taken up at 4 o'clock. Gath's Hope wins the heat.

BOB GATES AND CANADA PEG.

Bob Gates, handled by Stephenson, and Canada Peg, handled by Avent, were cast off in a field of sedge grass at 4:10. They got away at a clipping gait. In speed and style, in going, and on point, they were evenly matched. Bob Gates soon got a point on a bevy, near a branch. The birds flushed and flew into sedge grass, where Peg picked up three points in rapid succession and Bob flushed a single bird. Going across branch Peg pointed again. Then, on the side of the hill, Bob pointed a single bird; lower down the hill he pointed again. Then, going into woods, Bob pointed in fine style, but Stephenson failed to flush a bird before him. They then drew a corn field blank, and were taken up at 4:50 to be put down again next day. Saturday was cold and cloudy. The same brace cast off in grass at 9 o'clock, and worked into woods, where Canada Peg flushed a bevy. She then pointed a single bird. Going on she flushed three or four birds, and was stopped to order. Then Bob Gates pointed where a bevy had been flushed and Peg backed. Going on in grass she pointed handsomely and staunchly a bevy, which was flushed and followed into a thicket, but could not be found. On hill Bob Gates flushed a bevy and dropped to wing, then flushed a single bird. Near a fence Bob pointed a single bird—flushed but not shot at. Going on, he made a point on two birds, then pointed a single bird. Moving on, he again got a point on a single bird. Brace taken up at 10:10. Bob Gates wins the heat.

LOGAN AND PEGFLY.

Logan, handled by Moody, and Pegfly, handled by Bevan, were cast off in a field at 10:20, and were worked into an oak thicket, where Logan pointed a bevy and Pegfly backed. The birds flushed, and both dropped to wing. Then Pegfly pointed a single bird. Going on, both pointed a bevy. Following the birds, Pegfly pointed twice in succession, and Logan false pointed. Some distance beyond, in a grass field, Logan flushed two birds, then turned his head and pointed balance of bevy. Birds flushed and shot at. Steady to shot. Then Pegfly roaded and pointed a bevy. Taken up at 11:15, and Pegfly wins the heat.

BON SELENE AND NANNIE S.

Bon Selene, handled by Ellison, and Nannie S., handled by Tucker, were cast off in grass field at 11:25, to be worked on scattered birds. They were a nice going and stylish brace. Bon Selene soon flushed a single bird. Going in opposite directions both came together and dropped on a point on a hare. Hare flushed and steady to fur. Then Bon Selene flushed a single bird. Soon after, both dogs dropped on a point on four birds. Going after the scattered birds, Bon Selene dropped on a point, moved up and pointed again; bird flushed itself. Ellison shot—steady to wing and gun. Then Nannie S. pointed a single bird, and, going on, pointed again. Tucker flushed and killed—steady to wing and gun. Going into plum thicket, Bon Selene pointed a hare, and Nannie backed. They were taken up at 12:20, and Nannie S. wins the heat.

TARQUIN AND BEAUTY GLADSTONE.

After lunch, Tarquin, handled by Short, and Beauty Gladstone, handled by Ellison, were cast off in a wide grass field at 1:15. Soon after starting, Tarquin ran into and flushed a bevy as Beauty was drawing on them. Following the bevy, Beauty flushed a single bird and dropped to wing. Then Tarquin flushed a single bird. In very high grass he roaded and flushed a bird. Going on, Tarquin walked into the middle of a bevy. Following the birds, Beauty pointed. Ordered on, Tarquin pointed. Bird flushed and shot at; steady to shot and wing. Going on, Beauty pointed a bevy in the edge of a brier thicket. Birds flushed and followed into grass, where Beauty pointed a single bird, and Tarquin got a point and a flush. Brace ordered up at 2:20 and Beauty wins the heat.

NOBLE C. AND PAP SMIZER.

Noble C., handled by Stephenson, and Pap Smizer, by Zimmerman, were cast off in sedge grass at 2:35. They got away at a very fast pace. In speed and style of going and on pointing Noble C. had the advantage. They ran through open ground and made a wide cast to the right through sedge, where Noble ran up an outlying bird of a bevy, which flying over the bevy, caused the rest to flush. They went down into the woods, where the dogs picked up points so fast they could scarcely be scored. First Noble pointed a single bird, went on and pointed again, then flushed. Then Pap pointed a single bird. Bird flushed and shot at, Pap steady to wing and gun. Ordered on, Noble flushed a single bird. Then Pap pointed twice in succession, and then false pointed. Then Noble pointed, then false pointed and pointed again. He then

made a cast to the right and pointed a bird in magnificent style in a clump of briers. Taken up at 3:30. Noble C. wins the heat.

CARLOTTA AND PEGBID.

Carlotta, handled by Tucker, and Pegbid, handled by Waters, were cast off at 3:35 in a burnt field and worked into grass, where Carlotta dropped on a point, roaded and dropped again, when the bevy flushed. Judges did not allow her a point. Following them into grass, she got a point on a single bird. Tucker shot and killed; Carlotta steady to wing and shot. Ordered on, Pegbid flushed a single bird. Further down the hill Carlotta dropped on point on back scent and then commenced roading, when Pegbid came up and pointed the bevy. Waters shot and killed; both dogs dropped to shot. Following the birds into grass, Carlotta flushed a single bird. She then pointed twice in succession. Running down the road she wheeled to a magnificent point on a single bird, Pegbid backing in splendid style. Tucker shot and killed; both dogs steady. Pegbid went out of sight over a hill, when a bevy got up, supposed to be flushed by him. Brace taken up at 4:30, and Carlotta wins the heat.

JACKSON AND MAGGIE GLADSTONE.

Jackson, handled by Ellison, and Maggie Gladstone, handled by Gillam, were cast off in sedge grass at 4:35. Jack was soon out of sight over a hill, and was found pointing a bevy in low grass. Birds were flushed but not shot. They flew into sedge grass, where Jack pointed a single bird. Maggie not up to back. Ordered on, he pointed again, when two birds were flushed before him. He then pointed a single bird. They were ordered up at 4:55 and Jack wins the heat.

First Series.

Sam Sterrett beat Joe Noble.
King Shot beat Pegjim.
Nortier beat Gathlit.
Gath's Hope beat Maud D.
Bob Gates beat Canada Peg.
Pegfly beat Logan.
Nannie S. beat Bon Selene.
Beauty Gladstone beat Tarquin.
Noble C. beat Pap Smizer.
Carlotta beat Pegbid.
Jackson beat Maggie Gladstone.
Gath's Mark a bye.

Second Series.

Monday was clear and cold, with raw wind from northwest. Mr. F. I. Stone was obliged to return home and Dr. Rawlings Young, of Corinth, Miss., was chosen to fill his place. The first brace of the second series,

GATH'S MARK AND NORTIER,

were put down in open at 9:35. In edge of woods, Mr. Dew flushed a bevy, which flew over Mark, and he stood to wing. Going on, Gath pointed a bird and Nortier backed in good style. Tucker flushed and killed; both dogs steady to wing and gun. A number of birds flushed wild from handlers and judges. Following them into grass, Gath false pointed, and, moving on, flushed a single bird. Nortier coming up, pointed where the bird had flushed. Going into woods, Nortier pointed handsomely and staunchly a bevy, backed by Gath in fine style. Short flushed and fired, both dogs steady. Following the birds, Nortier flushed and Gath pointed. Going on, he pointed where a bird had been flushed. Ordered on, Nortier pointed a hare. Making a cast, Gath dropped on a point near a fence. Tucker failed to flush a bird before him, and a false point was called; but he went back and pointed again. The bird was flushed and Gath scored his point. He had the advantage in speed, range and style over Nortier. The brace was ordered up at 10:15, and Gath's Mark awarded the heat. After waiting until 10:50 for the next brace,

SAM STERRETT AND GATH'S HOPE,

they were cast off in grass. After drawing the field blank, in briers at edge of wood Gath whirled and dropped on a point, backed by Sam. Rose, to order, flushed a very large bevy. Both dogs steady to wing. Following to woods, Sam pointed, blinked his birds and then went in and flushed. Near by Gath pointed, but his handler failed to flush a bird before him. Ordered on, he roaded, and in good style pointed a bevy. Following into edge of field Sam flushed and Gath pointed. Ordered on, Gath false pointed. In style, range and speed Gath's Hope had decidedly the advantage. The brace was ordered up at 11:25 and the heat awarded to Gath's Hope. The next brace to run was

BOB GATES AND PEGFLY.

After waiting until 1 o'clock and Pegfly not being on hand, his handler having lost his way, the heat was given to Bob Gates, and the next brace,

BEAUTY AND NANNIE S.,

were cast off in open field at 1:05. They started away up wind at a rattling gait and immediately run into a bevy. Both dropped to wing. The birds went down in grass, where Nannie pointed, and Beauty flushed. Ordered on, Nannie flushed. Going into swale Nannie pointed and Beauty false pointed, backed by Nannie. Going after a feeding bevy that had been marked by spectators, Nannie flushed an outlying bird and dropped to wing. Ordered on, she pointed in good style the balance of the bevy. They were then ordered up at 1:35 and Nannie S. awarded the heat.

NOBLE C. AND CARLOTTA

were cast off at 1:40 in sedge grass. Carlotta soon scored a point on a bevy. To order Tucker flushed, and birds flew into grass and low bushes on edge of pond; both dogs steady to wing. Following the bevy, Noble pointed a single bird, which was flushed, but not shot at. Working on around edge of pond, Noble pointed single bird again. He then, a little further on, made a handsome and stylish point. To order, Stephenson flushed. Making a wide cast, Carlotta drew to a point on a bevy, backed by Noble in splendid style. The birds were flushed to order and flew into some low briers and grass, where Noble C. picked up four points in quick succession. They were then ordered up at 2:20, and Noble C. declared winner of the heat.

Second Series.

Gath's Mark beat Nortier. Gath's Hope beat Sam Sterrett. Bob Gates beat Pegfly. Nannie S. beat Beauty Gladstone. Noble C. beat Carlotta. Jackson a bye.

Third Series.

GATH'S MARK AND JACKSON

were cast off in the open at 2:25. Working down into grass, Jack pointed a single bird, which was flushed to order but not shot at. Going on, Mark dropped on a point with his head up wind. Tucker failed to flush a bird, and ordered on, Mark made a cast, drew, and coming back pointed at the same spot, and his handler again failed to flush. Going into woods, Mark was found dropped on a point. Birds flushed, but not shot at. In following scattered birds, both dogs pointed at the same instant another bevy, which flew out into a grass field. Following the scattered birds, Mark pointed and Jack was dropped by his handler. Bird flushed and shot, and both dogs steady to wing. Ordered on, Jack flushed a single bird, followed with a flush by Mark. Working back toward the woods in grass, Jack scored two more flushes. Going into woods again, Mark made a point which Jack refused to honor, and was dropped by his handler. The brace was then ordered up at 3:10, and Gath's Mark awarded the heat.

BOB GATES AND GATH'S HOPE

were then put down at 3:15 in open. They got away at a good fair rate of speed, though Bob was not as fast as in his previous heats. They drew a wide cornfield blank, and in edge of grass Bob pointed a single bird. Going down a swale in high grass Gath false pointed several times and then pointed a single bird. Working on Gath again scored a point, held it an instant, jumped in and caught the bird, which his handler compelled him to drop. Going on Gath pointed a bevy. Bob backed in grand form. Following the birds into grass, he got two points in quick succession, and then flushed twice. He then pointed again and the bird was flushed and killed. He was steady to wing and gun. Going over a fence into a wood Gath got a point on the side of a hill on a single bird. Just below him Bob pointed and then moved on and a bevy flushed wild before him. Following the birds into a ravine Gath flushed a single bird. They were then ordered up at 4:45 and the heat awarded to Gath's Hope. This ended the work for the day.

Tuesday was bright, cold and clear; wind from southwest.

NOBLE C. AND NANNIE S.

were cast off in a weed field at 9:40. They drew through to some woods blank, then through the cover to sedge grass, where Noble pointed a grass bird. Nannie coming on, pointed the same scent. Going on, Noble pointed in a cotton field, and Nannie was ordered up to back, when she pointed out to one side. Both dogs were allowed a point. None of the single birds were found, and we worked through some woods, when Nannie pointed in a brush pile. Noble was not up to back. The birds were flushed and followed into a cotton field, where Nannie flushed a single bird, and going on scored a point. She then flushed again. They worked the open blank and went back into the same woods, where some birds had been flushed and marked down. Noble coming round to a brush pile, flushed three birds, and the rest took wing all around. Both dogs then drew on a running bird, Nannie roading too near it. Ordered on, Nannie pointed, Tucker flushed, but did not shoot. Noble then pointed a single bird. We then left the woods and worked through corn. Some birds were flushed, and went back into the woods. Going after them, Nannie flushed a single bird, dropped to wing and, moving on again, flushed. Noble then scored a flush on single bird, and, moving on, Nannie flushed. Then we left the woods and cast out into corn ridges, and worked through to some woods beyond, where Nannie pointed a bevy in a thicket. Tucker flushed and shot, but did not kill. The dogs were then ordered up at 11:35, and the heat awarded to Nannie S.

This finished the third series, with the following result:

Third Series.

Gath's Mark beat Jackson. Gath's Hope beat Bob Gates. Nannie S. beat Noble C.

Fourth Series.

GATH'S HOPE AND GATH'S MARK

were put down in the open at 11:44 and worked the field and thicket blank. Then we turned back for the birds left from the last brace, none of which were found. Then we worked through corn, where Gath's Mark had the best range and speed. Going to some woods Mark flushed a bevy which went into sedge grass. Following them, each dog scored a point on single birds. Hope pointed again and Mark dropped on back, moved on and flushed the bird. Hope scored another point, and Mark a flush. Mark then false pointed and Hope coming up refused to back. Hope then flushed a single bird down wind and dropped to wing, moved up and pointed a single bird. Rose flushed but did not shoot. The dogs were then ordered up at 12:45, and the heat awarded to Gath's Hope.

Fourth Series.

Gath's Hope beat Gath's Mark. Nannie S. a bye.

Final Tie for First Place.

NANNIE S. AND GATH'S HOPE.

After lunch Nannie S. and Gath's Hope were put down in a cotton field at 2:35 to run for first place. Working across a bottom through sedge, Gath's Hope pointed a bevy. Nannie was not up to back. Rose flushed, but did not shoot. The birds flew into heavy cover, where Nannie roaded and the birds flushed wild. She then flushed a bevy in heavy cover. She then pointed, roaded on and pointed again. Gath was not up to back. After drawing field and woods blank we crossed a creek into sedge grass, where Nannie soon pointed. When Tucker went up to flush, he flushed the bird to one side and dropped her. The judges awarded her a point and ordered her on, when she pointed the same birds which she was first pointing, and was given another point, to which she was certainly not entitled. Tucker to order shot and crippled a bird, which flew some distance, and Nannie, going on, pointed the spot where it fell. Both dogs roaded, and Gath pointed and to order retrieved it. We then worked to the edge of the sedge, where a bird was marked, and Gath pointed it. Rose flushed, and the bird flying over Gath, he made a jump for it and dropped to order. Making cast back into the sedge for another bevy, Nannie was found dropped on a point. Gath refused to back, swung around behind her and commenced roading. Tucker went in to flush, when Nannie moved up. In the meantime Gath had established a point, when the birds flushed wild. The judges gave Gath the point, with which decision we did not agree, as Nannie had pointed the birds before Gath came up. Some distance around a sedge hill Gath pointed a bevy in fine style and was nicely backed by Nannie. Rose flushed, but did not shoot. Both dogs were steady to wing. Several were then flushed by the judges. Following them Nannie pointed, but Tucker failed to flush a bird before her. Several birds were then flushed by the handlers and spectators and crossing each other the dogs flushed a bird between them. They were then ordered up at 3:05 and the heat and first money awarded to Gath's Hope.

Ties for Second Place.

BOB GATES AND GATH'S MARK.

A heat was then run between Bob Gates and Gath's Mark to decide which should run against Nannie S. for second place. Mr. Stephenson being sick and unable to run his dog, he was handled by Mr. J. Avent. They were put down in the sedge grass at 3:20. In the woods beyond, Bob Gates pointed a bevy, Avent flushed and shot, but did not kill. Going on, Bob pointed a single bird, which was flushed but not shot at. Gath's Mark then scored three flushes and Bob one. They were then ordered up, and Bob wins the heat; down twenty minutes.

Final Tie for Second Place.

NANNIE S. AND BOB GATES

were ordered down to run for second place at 3:45. Bob soon pointed a bevy, and was backed by Nannie. Avent flushed, but did not shoot; then each dog flushed a single bird; going on, Bob flushed again and Nannie pointed a single bird; ordered on, Bob pointed, Avent flushed the bird, but did not shoot; Bob steady to wing. Nannie then dropped on a point, but moved on; Bob pointed and Avent going up, Bob discovered his error and moved on. Then Nannie, drawing on, pointed; still no birds were flushed. Ordered on, Bob made a cast, and, swinging round, pointed in fine style. Avent flushed, but did not shoot. Following the birds into some weeds, Bob pointed. Avent flushed two birds, but did not shoot. The dogs were then ordered up at 4:12, and Bob Gates awarded the heat and second place. In range, speed and style he far surpassed Nannie S., and won on his merits.

Ties for Third Place.

Canada Peg, Gath's Mark and Nannie S. divided third prize equally.

Following is a complete

SUMMARY.

First Series.

Sam Sterrett beat Joe Noble.
King Shot beat Pegjim.
Nortier beat Gathlit.
Gath's Hope beat Maud D.
Bob Gates beat Canada Peg.
Pegfly beat Logan.
Nannie S. beat Bon Selene.
Beauty Gladstone beat Tarquin.
Noble C. beat Pap Smizer.
Carlotta beat Pegbid.
Jackson beat Maggie Gladstone.
Gath's Mark a bye.

Second Series.

Gath's Mark beat Nortier.
Gath's Hope beat Sam Sterrett.
Bob Gates beat Pegfly.
Nannie S. beat Beauty Gladstone.
Noble C. beat Carlotta.
Jackson a bye.

Third Series.

Gath's Mark beat Jackson.
Gath's Hope beat Bob Gates.
Nannie S. beat Noble C.

Fourth Series.

Gath's Hope beat Gath's Mark.
Nannie S. a bye.

Final Tie for First Place.

Gath's Hope beat Nannie S. and won first prize.

Ties for Second Place.

Bob Gates beat Gath's Mark.

Final Tie for Second Place.

Bob Gates beat Nannie S. and won second prize.

Ties for Third Place.

Nannie S., Gath's Mark and Canada Peg divided third prize equally.

GUYON.

THE AMERICAN KENNEL CLUB.

There was a meeting of the American Kennel Club at the Hoffman House, New York, on Wednesday, Dec. 17. The following clubs were represented: New England Kennel Club, New Haven Kennel Club, Westminster Kennel Club, New Jersey Kennel and Field Trials Club, Philadelphia Kennel Club and Montreal Kennel Club. Major J. M. Taylor sent in his resignation as president of the club, which was accepted and Mr. Elliot Smith was unanimously elected in his place. The Louisville Kennel Club sent a withdrawal from the club, which was accepted. It was voted that an assessment of $10 should be paid to the association by each member. The rule relative to champions, was amended to read: "A dog to compete in a champion class must have won three first or champion prizes." All protests and accompanying papers were referred to the committee on discipline. Several of the committees on standards reported, and it was voted that their reports be published and that no action be taken upon them until some future meeting.

Following is the report of the committee upon the standard for the English setter:

THE ENGLISH SETTER STANDARD.

The English Setter is essentially a field dog, and a proper estimate of his value on the bench can only be made with a due regard to his field merit, as expressed in his formation and blood characteristics, no judgment of a setter on a bench can take into account the quality of his nose, or the quality of his intelligence. The value of these characteristics are only to be determined in the field, when they are brought into use, except perhaps, as the quality of these important factors may be incidentally suggested by the absence of indications of outside blood, and the presence of certain expressions of the motions, with which the judge is familiar. There is, however, so much guess work in valuing these qualities, that no points can be allowed for them, nevertheless, they do, in the eyes of a good judge, and he tacitly gives the dog credit for pleasing expressions in various ways; sometimes giving him the doubt of a point upon which a value is placed and again crediting him upon the score of quality, but so far as it is possible to do so, the judge should divest himself of an attempt to measure the probable quality of a dog's nose or intelligence on the bench. He should be concerned chiefly with the quality of the dogs formation for speed, endurance and adaptability for the work required of him (much attention too, must be paid to those race characteristics which have no relation to the question of locomotion, for a badly bred dog is sometimes well formed, but the presence or absence of characteristics which indicate outside blood, pre-supposes that the dog, although made to go and able to go, will be wanting in the instincts peculiar to the breed).

As to what constitutes the best form, there are, and always will be a variety of opinions, no conceptions, no matter upon what extent of practical data it may rest, or how judiciously the data may be used, can create an ideal. An ideal which shall pass as perfection is not here attempted, but on the contrary, the conception here expressed is made only as it appears to be an improvement on what has gone before, with the full assurance that higher and yet higher conceptions will follow. Absolute perfection is not contemplated; it is recognized as being beyond reach, improvement only is attempted.

The setter's formation which seemed to be the most desirable ten years ago, is no longer held to represent the best type of breed, and characteristics that were thought objectionable have proved desirable. The present ideal compared with the ideal of ten years ago differs in the addition of such particulars as have been proved to be desirable, and the loss of those which trials have demonstated to be undesirable.

The head of the English setter of to-day differs very little from the head as described by writers ten or even twenty years ago, the present fashion is for a head a trifle longer and lighter than that described of dogs in the past. This type is desirable since it is in harmony with the general type of the dog, the demand being for more length and less width throughout.

The following description in which we quote largely from Stonehenge, we submit:

Head (20).—The skull is of a peculiar character not so heavy as that of the pointer and without their narrow and marked prominence of the occipital bone. It is narrow or of medium width between the ears, and should have a decided brow over the eyes. The nose should be long and with width in harmony with the skull, without any fulness under the eyes.

There should be in the average dog 4 or 4½ inches from the inner corner of the eyes to the end of the nose. Between the point and root of the nose there should be a slight depression, at all events, there should be no fulness, and the eye-brow should rise sharply from it. The nostrils must be wide apart and large in openings, and the end of the nose moist and cool. In all setters the ends should be black or dark liver colored, except in whites, or lemon and white, a pink nose may in them be pardoned. The jaws should be exactly equal in length, a "snipe-nose" or "pig jaws" as the receding lower one is called, being greatly against its possessor. The ears should be hung well back and set low, of moderate length and slightly rounded at the point, the "leather" should be thin and soft; carried closely to the cheeks, so as not to show the inside, without the slightest tendency to prick the ear, and should be clothed with silky hair about two inches in length. The lips are not so full and pendent as those of the pointer, but at their angles there should be a slight fullness, not reaching quite to the extent of hanging. The eyes must be full of animation, and of medium size, the best color being a rich brown, and they should be set with their angles straight across.

Neck (6).—The importance of a long lean neck has not been fully realized until quite recently, or at all events, there has not been sufficient stress laid upon the point. Length of neck tends to high-headedness, and permits the dog to feel about

for scent over a greater amount of space than he could with a short neck, besides it adds greatly to his style. It has not the rounded muscularity of the pointer's neck, being considerably thinner, it should gradually deepen as it approaches the shoulders, joining them in graceful curve. It must not be "throaty" though the skin be loose.

Shoulders 6 and Chest 12 (18).—The shoulders and chest should display liberty in all directions, with sloping, deep shoulder blades and elbows well let down and at an angle bringing the fore legs well under the dog. Mr. Laverack was very fond of a setter with well sprung ribs, back of the shoulder. A feature all right provided they had depth also, but he laid so much stress upon this point in his collections of dogs for stock purposes that his breed was not only round in the barrel, but the width was carried forward between the shoulders, a very objectionable form. So. also, is the deep thin chest, with little spring of ribs behind the shoulder, known as "slabsided." Public field trials have demonstrated that there should be as much volume of chest as it is possible to obtain, distributed in such a manner as not to interfere with the shoulder of the dog, or restrict his pace in any way. The chest should be thin enough to allow the shoulders to lay flat and move with freedom. Great depth at this point is objectionable, since it puts too much weight on the shoulders and fore legs. The weight should be distributed as evenly as possible between the forward and hind parts, the tendency is too much forward. By placing the greater volume of chest back of the shoulders, the fore parts are relieved of weight that should be, in part, supported by the hind part. The drop in the chest should be just back of the elbows sloping upward toward the neck, permitting the dog to carry his neck and head up with more ease. Back of the play of shoulder, the ribs should spring gradually to the middle, and then gradually lessen to the back rib, the greater the length from the shoulders to the last rib the better, and the greater the depth of the last rib the better. A longer dog than the present type is desirable, but with the additional length and weight in the middle there will follow a tendency to "sway-back" which is to be met with a slight arch or additional strength in the back.

Back and Loin (6).—It is very much the custom to treat of a dog's loin as all that constitutes his back; as a matter of fact, the back between the point of the shoulders and the loin is to be considered separately from the loin, as a dog may be good in one and weak in the other. The loin should be strong and of moderate length. There is such a thing however as a dog having too much loin, every ounce more than he needs is so much dead weight. In estimating the quality of a dog's loin, due regard must be paid to his condition, as a fat dog, with naturally a poor loin, appears exceedingly good in this particular, while a thin dog with naturally a good loin will appear deficient in that respect, an arched loin is desirable, but not to the extent of being "roached" or "wheelbacked."

Quarters and Stifles (10).—The quarters should be broad across the top, the hip-bones slightly prominent and wide apart, with good length to point of bone at root of tail. The quarters should be well muscled, an excessive quantity not needed only amounts to lumber. The stifles should be moderately well bent, excessive bend, although fashionable for a time, is no longer thought necessary. A little bow at stifles is a point of merit, as the feet in such cases stand squarely under the dog and are moved forward in a straight line, the slight bow serving as well to keep the stifles and legs easily away from the body when the quarters are brought forward. Stifles that bend in are faulty, and are a special sign of weakness.

Legs, Elbows, Hocks 8, and Feet 7 (15).—The elbows and toes which generally go together should be straight, and if not the "pigeon toe" or inturned leg is less objectionable than the out-turn in which the elbow is confined by its close attachment to the ribs. The arms should be muscular and the bone fully developed with gradual slope from fore arm to foot with hard flinty feel to leg, no looseness of skin on leg, with strong and broad knees, short pasterns, of which the size in point of bone should be as great as possible, and their slope not exceeding a very slight deviation from the straight line. The hind legs should be muscular, with plenty of bone and clean strong hocks wide between the thighs. The feet should be carefully examined, as upon their capability of standing wear and tear depends the utility of the dog. Some fancy the round cat foot, and it is generally preferred. Others the long hare foot. Either type is good if the feet are close and strong, with toes well arched and well clothed with hair.

Stern (5).—The stern, or tail, should be carried straight, or with slight curve upward, either slightly above level of back or down. There should be no curl, it should taper to a fine end, and reach the hocks. The feather must be composed of straight silky hairs, tapering to a point with tail.

Coat and Feather (6).—The coat should be flat, with an absence of wave or curl. The feather should be considerable and fringe the legs.

Color of Coat (4).—Too much stress must not be put upon color, as all setters, others than red or black and tans are included in the class known as English setters, and the color in this breed is only a matter of fancy, some prefer black and white, or black, white and tan, others lemon and white, and others again liver and white. Being only a matter of fancy, it should be dealt with gently. The colors are now generally classed as follows, in the order given: (1) blue belton with tan. (2) Black, white and tan, the black not so evenly and nicely distributed. (6) Lemon and white. (7) White. (8) Liver and white. (9) Black. (10) Liver. (11) Red or Yellow.

Symmetry and Quality (10).—After examining a dog critically in all of his points there yet remains to be examined the most important point of all; the harmony of the whole. The dog may have a good head, shoulders and quarters when looked at simply as single points, but when they are looked at collectively, as a part of one dog, they may be sadly out of harmony with each other, so with all other points when viewed in comparison with each other. The head may be a good head seen simply as a head, but it may be too large, or too small for the dog. The fore-parts may be good in themselves, but too heavy or too light for the hind-parts or the rest of the dog. It is the harmony of all points which constitute the symmetry and quality, and these points in their proper relation to each other go a long way toward what constitute the beauty and serviceable qualities of the dog.

ENGLISH SETTER VALUES.

Head	20
Neck	6
Shoulders and chest	18
Back and loin	6
Quarters and stifles	10
Legs, elbows, hocks, and feet	15
Stern	5
Coat and feather	6
Color of coat	4
Symmetry and quality	10
Total	100

(Signed) P. H. BRYSON, JNO. C. HIGGINS, J. M. TAYLOR, } Committee.

Friend P. H. Bryson—I leave margin and balance of this sheet for any suggestions you have to offer, or changes you think should be made. I have tried only to arrange it with a broad view, having no special dogs of any one to favor. Please return hereby Friday 25th, or Saturday, 26th, as I leave about that date for Pittsburgh. Your friend, J. M. TAYLOR.

3,092 PEDIGREES in the *American Kennel Register*.

GRAPHIC'S ALLEGED FLUSH.

ON this subject we have received a considerable mass of correspondence, which we can scarcely publish. A part of this comes from those nearly interested in Graphic, and a part from other individuals who are not familiar with the facts. Mr. James L. Anthony has written us, taking the ground that (1) our reports of the alleged flush were untrue; (2) that they are inconsistent with the fact that Mr. Heath was first informed of the alleged flush by our reporter, and he implies that this information, coming from the source it did, is inconsistent with our subsequent statement that "no flush had been charged to or scored against Graphic on the judges' books;" (3) that he was subsequently informed by another person that the judges had scored Graphic with a flush; and (4) that on the following morning, prior to the withdrawal of Graphic, one of the judges exhibited his book to Mr. Heath and Mr. Anthony, and they saw there the flush scored against the dog.

To these allegations and insinuations we reply as follows: (1) That the reports were written as we saw the events, and while it is possible that there may be mistakes or omissions, the facts were given as nearly as it was possible to give them; (2) that our reporter did speak to Mr. Heath, and say to him that Graphic had got, made or scored a flush, but that the words used would not bear the interpretation put upon them, because the flush, if made, was not in the nature of a fault and would not have counted against the dog; that when we stated that "no flush was charged to or scored against Graphic on the judges' books," we meant, as any one familiar with field trials should have known, that no such flush had been charged against the dog as a demerit; in other words, that the flush, if made, would not, under the circumstances, have counted against him in the remaining portion of the heat. We had not seen all the judges' books, but had seen one of them, and had the personal assurance of another that nothing had been done during the few moments the dogs were down; (3 and 4) that we have learned that a memorandum of a flush was made on one of the judges' books, but that this memorandum showed nothing as to the essential point of the inquiry, which is: Was a flush charged to or scored against Graphic by the judges as a demerit? Would this memorandum have injured his chances of winning if the heat had been run out? This has already been sufficiently answered in our report of the circumstances as follows: "A flush under the circumstances would be entirely excusable; indeed, the judges informed us that the dogs would start on even terms in the morning, and with a clean score."

FANCIERS' CLUB SHOW.—The dates selected for the dog show to be held by the Fanciers' Club, of New York, are Feb. 8, 9 and 10. It will take place in Madison Square Garden in connection with the annual poultry and pigeon show, which commences on Feb. 3. A good premium list has been prepared and nearly $800 will be offered in prizes. Application has been made for admission to the American Kennel Club, and the show will be held under the rules of that organization. The premium lists are now being printed and may be obtained from Mr. C. H. Harker, 62 Cortlandt street, New York.

HARTFORD KENNEL CLUB.—Hartford, Conn., Dec. 19. —*Editor Forest and Stream:* The citizens of Hartford propose to form a kennel club for the purpose of holding a bench show after the Boston show. Hartford seldom does anything by halves, and should everything work as mapped out, we hope for generous support. A liberal premium list will be issued, and we propose to join the American Kennel Club, so that wins will count. We shall endeavor to get the most popular judges for the exhibitors.—A. C. COLLINS.

THE WINSTED DOG SHOW AWARDS.—Winsted, Conn., Dec. 19.—*Editor Forest and Stream:* In your report of the dog show held here Dec. 15-18 you place M. G. Wheeler's Choice second in the Irish setter bitch class. Perhaps, as a matter of record, it would be well to state that it should have been Daniel Maxwell's Press.—FRANK D. HALLETT, Superintendent. *Editor Forest and Stream:* Fritz won the special "M. M." for the best trained dog at the Winsted show.—A. C. COLLINS.

FALL RIVER DOG SHOW.—*Editor Forest and Stream:* The fourth annual dog show of the Southern Massachusetts Poultry Association will be held at Fall River, Mass., Jan. 26 to 30. Dr. Geo. Walton, of Boston, will judge all the classes. —A. R. G. MOSHER (Fall River, Mass., Dec. 20).

ALL DOGS.—Frederick City, Md., Dec. 8—*Editor Forest and Stream:* I have in my possession a lemon and white English setter bitch that on Nov. 30 gave birth to a litter of seven pups, all of them dogs. Quite a rarity in the dog world, is it not?—F. H. MARKELL.

MASTIFF HEADS.—Our next issue will have as a supplement a page of drawings of mastiff heads, illustrating the change of type from 1863 to the present. These have been carefully drawn, and will be carefully printed on heavy paper.

THE December number of the *American Kennel Register* contains 183 entries, making the grand total number of dogs now registered 3,092.

KENNEL NOTES.

KENNEL NOTE BLANKS.—For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." All Kennel Notes must be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Barney, Jr. By Coughcura Medicine Co., Eau Claire, Wis., for Irish water spaniel dog, whelped Sept. 6, 1885, by Dan (Mike—Nora) out of Juda (Barney—Judy).

Ivory. By Frank F. Dole, New Haven, Conn., for white bull-terrier dog, whelped Nov. 8, 1885, by The Earl (champion Marquis—Lady) out of White Rose (A.K.R. 2906).

Viscount. By Frank F. Dole, New Haven, Conn., for white bull-terrier dog, whelped Nov. 8, 1885, by The Earl (champion Marquis—Lady) out of White Rose (A.K.R. 2906).

Faerie Queen. By Frank F. Dole, New Haven, Conn.) for white bull-terrier bitch, whelped Nov. 8, 1885, by The Earl (champion Marquis—Lady) out of White Rose (A.K.R. 2906).

Blanche. By Frank F. Dole, New Haven, Conn., for white bull-terrier bitch, whelped Nov. 8, 1885, by The Earl (champion Marquis—Lady) out of White Rose (A.K.R. 2906).

Regent. By Frank F. Dole, New Haven, Conn., for white, with brindle mark on ear, bull-terrier dog, whelped Nov. 8, 1885, by The Earl (champion Marquis—Lady) out of White Rose (A.K.R. 2906).

Sir Anthony. By F. F. Harris, Woodford's, Me., for liver and white pointer dog, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Nun. By F. F. Harris, Woodford's, Me., for liver and white pointer bitch, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Mikado. By F. F. Harris, Woodford's, Me., for liver and white pointer dog, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

May F. By F. F. Harris, Woodford's, Me., for liver and white pointer bitch, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Lewiston's Ideal. By F. F. Harris, Woodford's, Me., for liver and white pointer dog, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Belle of Woodford's. By F. F. Harris, Woodford's, Me., for liver and white pointer bitch, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Beau of Portland. By F. F. Harris, Woodford's, Me., for black and white pointer dog, whelped Nov. 18, 1885, by Graphic (A.K.R. 2411) out of Zitta (A.K.R. 1358).

Bowdoin. By F. F. Harris, Woodford's, Me., for lemon and white pointer dog, whelped May 13, 1885, by champion Beaufort (A.K.R. 694) out of Zuba (A.K.R. 1359).

Dirigo. By F. F. Harris, Woodford's, Me., for liver and white pointer dog, whelped May 13, 1885, by Beaufort (A.K.R. 694) out of Zuba (A.K.R. 1359).

AN average of over 1,000 pedigrees per volume brings up the total of the *American Kennel Register* at the end of its third volume to 3,092.

KENNEL MANAGEMENT.

☞ No Notice Taken of Anonymous Correspondents.

M. L., East Hampton, Mass.—A hound dog 4yrs. old has the piles. Have tried compound nutgall ointment with no success. Ans. You must keep the dog's bowels freely open with syrup of buckthorn or castor oil in dessertspoonful doses and use the following ointment twice daily: Of the extract of belladonna and extract of opium each 2 grains, of the acetate of lead 10 grains, of balsam of Peru ointment 2 ounces. Mix. Apply externally.

R. G., N. Y.—My setter pup, 6 weeks old, is ruptured to the size of a hen's egg. Ans. A cure is doubtful, but you should consult a surgeon. We can give no prophecy, not knowing where the rupture lies.

W. A. D., Lynn.—About eight months ago I noticed whenever I touched a certain part of the ear of my Gordon setter he howled as though in pain. I examined the ear at the time but could not see anything the matter. Four months ago he commenced to scratch the inside part of the ear. I checked him in this as much as possible. He shakes the head quite frequently, and for the last two months a dark matter has been running from the ear. Ans. Your dog has canker. Use the following: Of bromo-chloral and of laudanum each one dram, of water six ounces. Mix. Drop in the ear night and morning after cleansing.

WINT, Salem, Mass.—1. The spaniel is not too old to train. 2. The symptoms of worms are referable to the digestive and nervous systems. Evidence is given of pain, colicky in character, over the belly. Indigestion, often diarrhœa and vomiting after hearty meal, capricious appetite, sometimes ravenous and again absent, itching at nose and arms. When sleeping the dog moans, twitches violently, and sleep is not refreshing, general dullness. Of course the chief point is to search his discharges to find the worms.

Rifle and Trap Shooting.

RANGE AND GALLERY.

BOSTON, Dec. 19.—The attendance of shooters at Walnut Hill today was good for a winter's day. The weather conditions with the exception of a thick fog were very good, and several high scores were made. There will be a shoot Friday all day. It is expected that the military match will open that day on the new target. Saturday the range will be open as usual. The scores:

Decimal off-hand Match.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

WELLINGTON, Dec. 19.—To-day's shoot at Wellington was well attended and the number of birds broken rather above the average. The results: 1. Five pigeons—Shumway and Adams first. 2. Five blackbirds—Schaefer first. 3. Five pigeons—Snow first. 4. Five blackbirds—Tucker and Snow first. 5. Five pigeons—Lawson first. 6. Five blackbirds—Wardwell and Schaefer first. 7. Five blackbirds—Lawson and Adams first. 8. Medal match—Buffum first with 9, Wilson second with 8, Nichols third with 7. 9. Ten pigeons—Lawson first. 10. Five blackbirds—Shumway and Lawson first. 11. Five blackbirds—Schaefer first. 12. Three pair blackbirds—Lawson first. 13. Five pigeons—Nichols and Lawson first. 14. Five blackbirds—Snow and Stanton first. 15. Five blackbirds—Lawson first. 16. Five blackbirds, straightaway—Nichols and Wardwell first. 17. Team match—Nichols 12, Wardwell 15, Law 13, Tucker 16, Snow 12—68; Adams 13, Schaefer 13, Shumway 15, Wilson 9, Stanton 12—62. 18. Team match No. 2—Nichols 10, Wardwell 11, Lawson 15, Tucker 12, Snow 13—61; Adams 10, Schaefer 14, Shumway 15, Wilson 7, Stanton 15—61. There will be the usual Christmas shoot on Friday from 9 to 2 o'clock.

NEW ORLEANS, Dec. 17.—The Southern Sportsmen's Association met this evening at the Continental Armory for the purpose of perfecting arrangements for the annual game dinner hunt, fixed for the 8th, 9th and 10th of January. The rules adopted and to be applied in the match hunt specifically designate the following birds, with the percentage: Robins, 1; doves, 5; quail and snipe, 10; hawks and owls, 25; woodcock, 25; prairie chicken, 50. All game must be killed on the wing, and must be shot in a sportsmanlike manner. The following gentlemen pledged themselves to participate, and to forfeit $10 in consideration of failure to report: N. D. Wallace, president; John K. Renaud, treasurer; Henry Fontaine, secretary; Messrs. E. T. Manning, Charles J. Lewis, H. G. Hester, H. B. Febiger, Charles B. Maginnis, W. F. Gray, Gilbert H. Green, A. M. Bickham, Richard Frotscher, Steve D. Ellis, Dr. W. W. Weaton, Dr. W. W. Moore, Wallace Wood, C. L. Walker, W. L. Saxon, John T. Broadnax, R. C. Nicholson, F. B. Hoffman, J. P. Billups, J. V. Guillotte, Edgar T. Leche, and others to sign. The teams are as follows: Capt. A. M. Bickham, with the following team: H. Fontaine, H. B. Febiger, W. L. Saxon, John T. Broadnax, L. H. Jurey, G. H. Green, Wallace Wood, R. C. Nicholson, Dr. Wooten, J. P. Billups, E. T. Leche; Capt. C. J. Lewis, with the following team: John K. Renaud, C. B. Maginnis, W. T. Gray, T. B. Hoffman, Richard Frotscher, R. W. Foster, E. T. Manning, Dr. W. W. Moore, S. D. Ellis, J. V. Guillotte. Wednesday, Jan. 13, is the day set apart for the dinner. All game bagged to be reported by the contestants at H. B. Febiger's gun store, No. 168 Gravier street, on Monday, Jan. 11, at 12 o'clock M.

NEWARK, N. J., Dec. 19.—About 200 old-time pigeon shooters met on Erb's shooting grounds, on the Bloomfield road, Newark, this afternoon to see the pigeon match between W.W. Lever, of Elizabeth, and Sam Badgley, of Newark. The stakes were $200 a side, and the conditions of the match were 25 birds each, 25yds. rise, one barrel, the contestants to find trap and handle against each other, L. Cockford, of Bloomfield, was referee, the judges being W. Siegler, of Little Falls, for Badgley, and J. Ryan for Lever. The match began promptly at 2 o'clock, a strong wind blowing across the score from the left. This made most of the birds fast right hand drivers. Lever had the hardest birds to shoot at. He shot his opponent out on the 23d round, having killed all his birds, although his 10th fell just out of bounds. Badgley, who has a good local reputation, missed four entirely and had his 18th bird fall dead just over the boundary. The betting was in favor of Lever at the start and a few hundred dollars changed hands. The score was as follows:

S Badgley... 0011111111011111100111—17
W W Lever... 1111111101111111111—21

NATIONAL GUN ASSOCIATION.—Macon, Ga., Dec. 14.—The annual meeting of the stockholders of the National Gun Association will be held at Covington, Kentucky, Jan. 12, 1886, in the office of the county clerk in the court house, at 3 P. M., for the election of directors for the ensuing year. Those stockholders who are unable to attend can send their proxies to Mr. J. E. Bloom, of Cincinnati, vice-president of the Association, who will represent them for the best interests of the Association. A full representation is urgently requested, as a good board of directors is necessary to insure prosperity.—F. C. ETHERIDGE, Secretary.

GARDEN CITY CLUB.—The cup offered by the Garden City Gun Club was shot for at Thomas Lloyd's pigeon shooting grounds at Queens, L. I., on Thursday. The conditions were 12 birds each at 30yds. rise, Hurlingham rules, and the shoot was open to representatives of the Westminster Kennel Club, Riverton, Philadelphia, Carteret, Rockaway Hunt and Garden City clubs. Mr. R. B. Lawrence, of the Westminister Kennel Club, made a clean score and won the cup. Mr. Ramsay, of the same club, and Mr. Lesley, of the Garden City Club, killed 10 each. The birds were an extra fast lot, and were handsomely retrieved by the setter Fan.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

CRUISE OF THE COOT.

V.

THE first question asked wherever the Coot brought up was, "Are you all alone? I should think you would feel very lonesome." But strange as it may appear, a feeling of loneliness never overcame the sole occupant of the Coot's quarters. There was no time to be lonely. There was always plenty to do and think of. What with preparing meals, sailing the boat, snugging things down in the evening, provisioning and caring for the ship, no chance for dull hours of sombre contemplation were ever afforded. During bad weather letters had to be written, sketching materials were broken out, and the literary locker was always full to overflowing with magazines and papers of all sorts. Odd jobs in the cabin took up a considerable portion of the time at anchor. Furthermore, you were seldom without intercourse with the world for a single day. Friends were found and made in all the towns. Marketing brought you in contact with local lights who congregate about the stores. Human nature could be studied in a hundred of ways, and the idiosyncracies of provincial life supplied a broad field for amusing observation. There was animation on the river as well. Steamers and tows, schooners and boats passing and repassing. Characteristic types in build and purposes amid ever changing scenery and surroundings served to keep life on the tip-toe of expectation, and if mayhap a half hour of solitude did now and then occur, "Seal of North Carolina" soothingly bridged over the interval. Lest there should be lack of something to do, I had ransacked sundry bookstores before my departure and lugged aboard something for light reading. Plutarch's Lives, Loomis's Astronomy, Goethe, Byron and Darwin among others were relied upon to bid dull care begone, and lift the fancy into airy realms of delight. But Plutarch's Lives remain buried under a heap in the after locker, the softly twinkling diadems of the great arch above still constitute an unlocked puzzle, Margarethe moves in her maiden modesty, a virgin unwooed, Don Juan has yet to make his first impression and the Missing Link is still wanting. Mr. Telegraph and Mail have robbed time and distance of their meaning, and far from home and friends in miles as you may be, there is nevertheless such close connection that you do not feel the bonds quite sundered. The attraction in singlehand sailing is the consciousness of absolute independence, being master of your own movements with no one's preferences to consult. There is no crew whose comfort has to be taken into account and with whom you could not escape unwelcome familiarity in the confines of a small boat. There is no friend wanting to do this or that, just what you do not care to do. When you are hungry you eat, when not you take a cold bite. When you are sleepy you sleep, when you want to sail you sail and when you don't you "loaf." Neither time, space nor habit is allowed to proscribe other than you see fit. You learn to commune with your own thoughts and unravel your own mind. Who will say he is not a more congenial friend to himself than a second person whose conceptions and sympathies do not always fit in the same groove but lead off at tangents and occasionally at broad angles.

C. P. K.

BOSTON NOTES.—Mr. J. Malcolm Forbes has purchased the Puritan of General Paine, and the latter gentleman will build this winter a yacht 85ft. on waterline, from Mr. Burgess's designs.... Lawley & Son are busy with the alterations in the schooner Tempest, a new bow 8ft. longer, the frames for which are now in place. They are also building a yacht for a Baltimore gentleman. She will be 24ft. over all and 9ft. beam, with heavy keel keel. They have in hand a steam launch for Harvard College 50x6ft.... Ambassadress, schooner, Mr. N. Y. Thayer, has been docked at East Boston and some of her planking has been replaced, and also her sheathing has been partly renewed.... A keel keel of 15 tons, 60ft. long, is part of the alterations which Smith, of City Point, has been making on the schooner Gitana. Her bow has been lengthened also. The alterations are now completed and she is fitting out for a cruise to the West Indies.... Wood Brothers, of East Boston, have in frame their new sloop, and will soon commence work on a steam yacht.

ICE YACHTS.

EXCEPT to the favored few whose leisure admits of winter trips to the West Indies, the Mediterranean, or even to Florida, the cold winds of November bring a peremptory summons to discontinue all water sports and to lay up and haul out their craft. Then for a period of four or five months the yachtsman must content himself with such quiet amusement as can be had from reading, and a study of his boat, perhaps with an attempt at alteration or improvement in her. A few there are, however, for whom this tame sport is not enough, and who, though debarred by cold and ice from their favorite pursuit, turn the tables on Jack Frost and make him contribute to another pleasure in place of the one he has deprived them of. To any one familiar with sailing in the latitude of New York the waste of good wind is positively painful. Days and days of good weather are wasted waiting for wind; and then again, when cold and ice make yachting impossible on our rivers and lakes, there is an amount of good sailing breeze wasted often in one week that would sail all the races of the season. To utilize this waste product, a few hardy sailors of an economical turn of mind devote their time each winter to a form of sailing termed by courtesy ice yachting. To compare a yacht, with her graceful lines and beautifully rounded form, tumbling and tossing like a dolphin, to an angular and flat frame work that might pass for a huge mosquito bar, a patent harrow, or an immense planimeter, seems utterly absurd, while there is little resemblance to the varied pleasures of a yachting cruise in lying flat and snug as a cake on a griddle, in a little box, and whirling along a surface as level and smooth as a billiard table. On the other hand, however, the skill required and the excitement induced by an increase of speed from a paltry average of six or eight knots to a velocity greater than an express train, bring into play the same elements that make the main charm of yacht racing, and when the time limit, instead of 7 hours for 40 miles, is increased to 1 hour for 50, the interest and excitement increase with the danger.

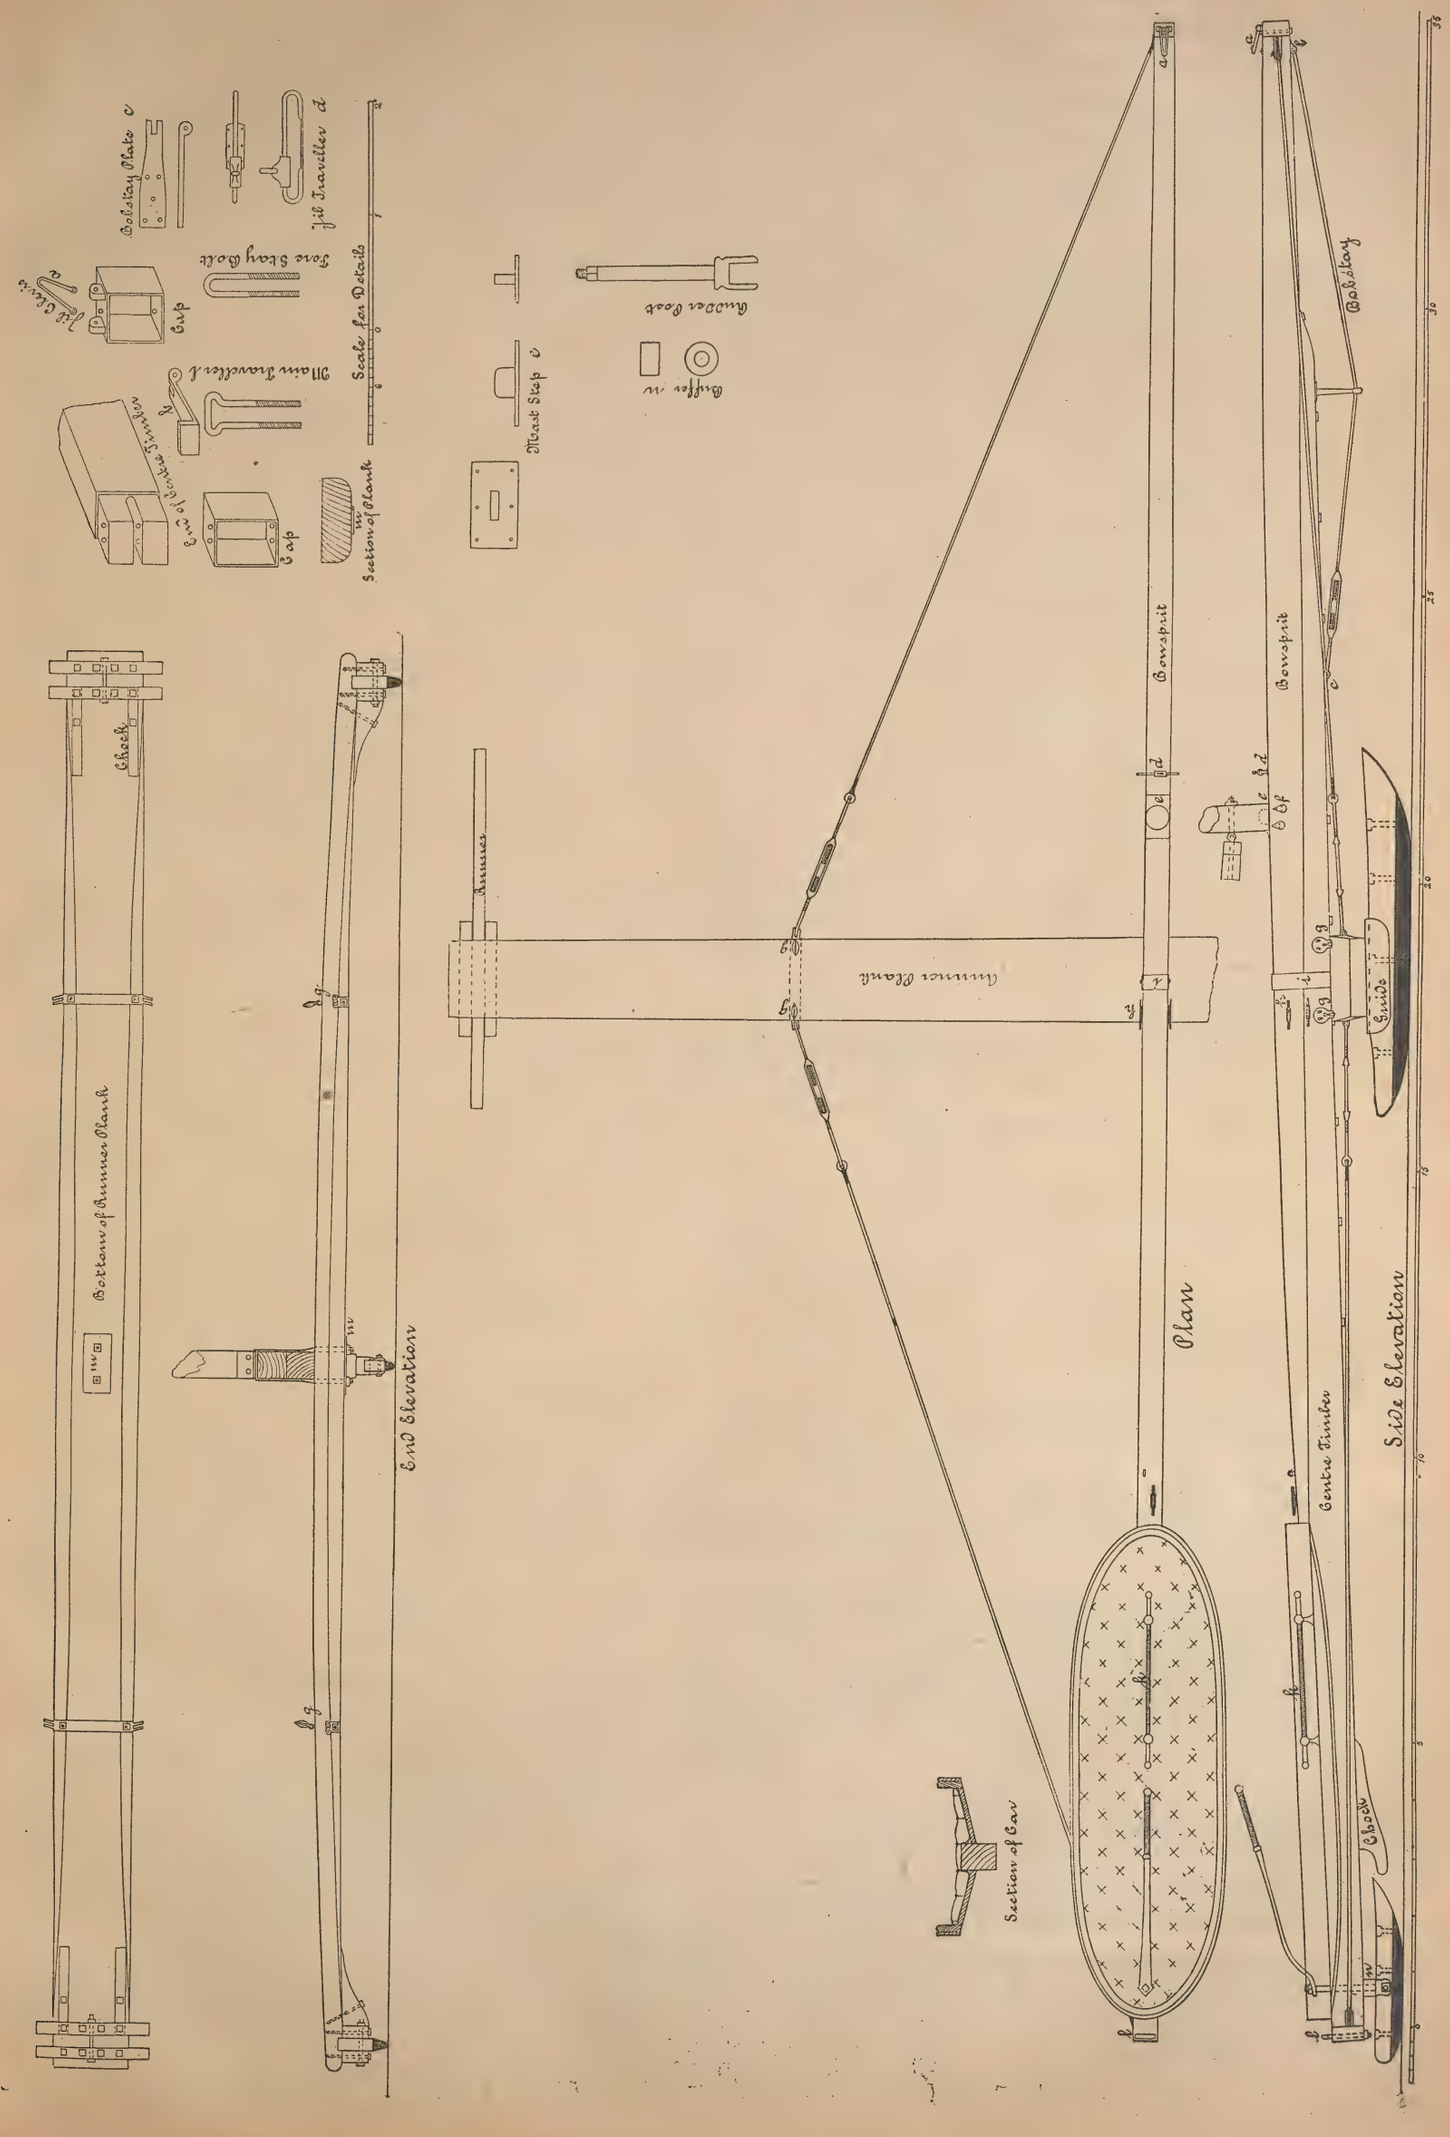
As yet, ice yachting is confined to few localities, the principal one, and where its development has been greatest, being on the Hudson River about Poughkeepsie and New Hamburg. Here are found the finest and most elaborate boats, and here the sport has been more completely organized. Another locality near New York is at Red Bank, N. J., the sailing ground being on the Shrewsbury River.

One great advantage the ice yachtman has over his brother sailor, keels and centerboards vex him not, depth enters not into his computations, and he is free from the fiend who bobs up at every possible opportunity with a long letter in favor of a displacement rule. However, there are models and models even in these queer boats, and fashions in build and rig change as in the craft that float. The essential parts of the ice boat vary but little. There must be a "center timber" or keel, the foundation of the whole structure, a "runner plank" crossing the former at right angles near its middle, three "runners," two (the runners proper) at the two ends of the runner plank, and pivoted at the after end of the center timber for a rudder. Besides these is a car in which the crew sit. In the older boats the runner plank and center timber were braced together by two "side pieces" running aft from the runner plank, and connected by a semi circular piece at the after end. These three pieces were of nearly the same outline as the rail of a narrow yacht from midships aft, and to them was fastened a light flooring resting on the center timber, in size and shape resembling the deck of a 20 or 30 ton cutter from the rudder post aft. This deck was the car, in which the crew sat or reclined. From the fore ends of the side pieces at the runner plank ran the bowsprit shrouds, to the fore end of the bowsprit, a continuation of the center timber. The mast was stepped directly over the runner plank, necessitating an extremely long boom.

Within a few seasons the mode of building has been improved in the direction of lightness and strength until, from a purely mechanical point of view, a very beautiful machine has been obtained. Lightness is essential to speed, the prime requisite in an ice-boat, but owing to the velocity they attain, every chance of a breakdown must be avoided, as a fatal result might easily follow. The boats as now built are light, strong and thoroughly braced in all directions. The boat shown on the opposite page is the St. Nicholas, owned by Com. Rogers, of the Atlantic Yacht Club, N. Y. C., whose fleet of ice-yachts at Hyde Park numbers six racing craft. The boat is 35 feet 3 inches long, and the spread of the runners is 24 feet.

a, Jib clevis.
b, *c*, Bobstay plates.
d, Jib traveler.
e, Mast step.
f, Fairleaders.
g, Deadeyes.
h, Cleats.
i, Strap.
k, Liferail.
l, Main traveler.
m, Plate of iron.
n, Rubber buffer.

The center timber is of white pine, 5in. wide and 8in. deep, tapering to 5×6in. at the after end. To it is scarfed the bowsprit, also of white pine, 5×8in. at largest part, just forward of the mast, and 4¼×6in. at fore end. The two pieces are bolted together by ½in. lag screws, spaced 18in. apart, the heads being down. The runner plank is of basswood, 17½in. wide and 6in. deep at middle where the center timber rests, and 16×3½in. at the ends. The extreme length is 25ft., and the upper side is curved, the amount of round or crown being 4in. The two lower corners are rounded off from the middle to the ends, as shown in the plan and section of the plank. At each end of the runner plank are two pieces of oak, 24in. long, 2½in. thick and 5in. deep, called the guides. These are spaced 2⅝in. apart and screwed to the beam with four ½in. lag screws each. Through each is a hole, bushed with a piece of gas pipe, ⅝in. internal diameter, to take the runner bolt. The outer corners of the guides are chamfered off. The inner guide on each end is braced with two chocks of 2in. oak, screwed to the runner plank. Each chock has a tenon, 1½×2in., running through the guide, the outer screws through guides also passing through the tenon. These four chocks give strength to resist any side thrust. The center timber rests directly on the center of the runner plank and is bolted to it by a strap of iron, *i*, 3×⅜in., the ends terminating in ¾in. bolts passing through the plank and set up against the plate, *m*, on the bottom side.



Four stays of half-inch wire rope, set up by turnbuckles, are used to stiffen the frame. The inboard-ends of each pair of stays are bolted into a plate 3×⅜in., which is on the under side of the runner-plank, and is secured by bolts through the plank, each with a deadeye, *g g*, for the shrouds. In the outboard end of each stay is an eyesplice and thimble. In the end of the center timber and also of the bowsprit, a score 3×1in. is cut, while through the end two ⅝in. holes are bored. A cap of ¼in. iron, 3in. wide, is made to fit over the end of the timber, as shown. Taking first the after end, the main traveler, *l*, of ⅝in. round iron, fits the two holes. The cap is driven on, its end being filled with a piece of mahogany, and the traveler is passed down the two holes, the ends of the stays being first placed in the slot, one on each side, so that one end of the traveler passes through each eye, after which the nuts are screwed up on the lower ends of the traveler. The fore end is fitted in the same manner, except that a U bolt is used in place of a traveler, taking the jibstay. At the fore end is also a piece, *b*, for the bobstay. This piece is set into the lower side of the bowsprit, the projection looking over the fore end, and the ends of the bolt pass through it as well as through the timber, the cap and the two eyes in the stays.

On the top of the forecap are two lugs to which a clevis, *a*, is bolted, holding the jib tack. The bobstay is of ½-inch round steel, one end bolting into the plate *b*, and the other into the plate *c*, screwed to the under side of the center timber. It is strained over an iron post 8 inches high, welded into a plate of iron 4x4x⅜ inches, the latter also screwed to the center timber. The runners are of oak, 2⅜ inches thick, with shoes of cast iron bolted to them. The bolts pass down through the shoe and are tapped into the iron. The sides of the shoe bevel in at the lower side, as shown in the end elevation, their lower edge being filed to an angle of 90 degrees or a little less. It is essential to speed that the edges be kept very sharp.

The runners are each hung on a ⅝ inch iron pin, the hole in the former being bushed with gas pipe. Two such holes are usually bored in each runner to allow for a slight shifting, if desirable. The runner is fitted quite tightly between the guides, and as little play as possible is allowed in all parts. The small runner aft is fitted to move freely as a rudder. It is hung by a pin in the rudder post, an iron forging with a stem 12 inches long and 1½ inches diameter, the top being squared for the tiller. The rudder post runs through a hole in the center timber, the latter being protected by brass plates on top and bottom. A buffer, *n*, of india rubber 2 inches thick is placed on the spindle under the center timber, acting as a spring. Just forward of the rudder is an oak chock bolted to the center timber to act as a guard and prevent the rudder from dropping into cracks. The car is made with a bent coaming of ⅞in. oak, resting on the center timber, outside of which a piece of ⅜in. mahogany is bent. The floor of the car is of pine and drops in the middle, as shown in the section. A cushion is made in one piece, with an opening to allow it to pass over the hand rail *k*. This rail is of iron carried on two small stanchions screwed into the timber. The iron bar is served with cord, as is the handle of the iron tiller. The latter was formerly made straight, but now it is the custom to curve it so that it will pass clear of the body when lying in the car.

The cost of a boat of this style is from $500 to $700, as the many details and forgings are expensive. In many localities where smooth ice is found an ice yacht may be made on this plan, but of cheaper construction, that will answer every purpose, but will not be as fast as the lighter and more expensive boat. The sail plan will be published in a short time.

ATALANTA.—Mr. Gould's yacht has sailed for Charleston, S. C., where, it is said, her owner will embark with his family for a long voyage.

THE GALATEA'S CHALLENGE.

AT a special meeting of the New York Y. C., Tuesday evening, Dec. 22, the following challenge was read and accepted. Secretary C. A. Minturn was directed to notify Lieut. Henn's representative in the matter:

16 Cranley Gardens, S. W., London, Nov. 7, 1885.—Charles E. Minton, Esq., Secretary N. Y. Y. C.: Dear Sir—I am instructed by Lieut. W. Henn to challenge the New York Y. C. for the possession of the America's Cup on behalf of his cutter yacht Galatea, whose nomination and other certificates, as specified in deed of gift, were forwarded to you on Feb 17 last. This challenge he takes to be a withdrawal of the one of Feb. 17 last, and my letter of Oct. 6 to be an explanation of the terms he would request. Yours faithfully, J. BEAVOR-WEBB.

The terms to which Mr. Beavor-Webb refers are that five races shall be sailed, instead of three, two to be at Newport and three here, and all to be late in the season, so as to avoid the period of calms and assure a more favorable time.

THE LAWS RELATING TO STEAM YACHTS.

THE committee appointed by the New York Yacht Club last winter to secure some changes in the laws relating to steam vessels have lately drawn up the following bill which will be presented by Mr. Perry Belmont. The matter is one in which all owners of steam yachts are directly interested, as its passage will relieve them of many expenses and annoyances to which they are now subjected through being classed with vessels large and small used only for commercial purposes. It can work no disadvantage to the latter as it affects only vessels actually in use for pleasure purposes by bona fide owners. It is desired that yachtsmen in all parts of the country will use their influence with their representative in favor of the bill that its early enactment may be assured. The steam pleasure fleet of this country is even now of considerable importance and is rapidly growing, and it is entitled to a recognition and encouragement by proper legislation which has thus far been denied it.

Following in the text of the proposed bill:

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled: That for the purpose of correcting errors in the act entitled "An Act to Revise and Consolidate the Statutes of the United States in force on the first day of December, Anno Domini one thousand eight hundred and seventy-three," and the subsequent acts amendatory thereof, the following amendments are hereby made therein: which amendments shall take effect on the first day of July, Anno Domini one thousand eight hundred and eighty-six.

Section 4214 is amended by striking out the whole section and inserting the following: "Sec. 4214. The Secretary of the Treasury may cause yachts used and employed by their owners exclusively as pleasure vessels and designed as models of naval architecture, if entitled to be enrolled as American vessels, to be licensed on terms which will authorize them to proceed from port to port of the United States, and by sea to foreign ports, without entering or clearing at the custom house. Such license shall be in such form as the Secretary of the Treasury may prescribe. A yacht is a vessel of any size, propelled by sails, steam or any other motive power, which is used by its owner for pleasure purposes, and which does not carry passengers or merchandise for pay. A steam vessel which is hired to an individual is not to be considered as a yacht. A yacht to be entitled to the privilege of this section must be duly enrolled in a duly incorporated yacht club, the ride and a certified copy of the act of incorporation of which must be filed with the Secretary of the Treasury. Any steam yacht enrolled as such and then running or chartered for pay shall not be entitled to such privilege. The owner of any such vessel, before taking out such license, shall give a bond in such form and for such amount as the Secretary of the Treasury shall prescribe, conditioned that the vessel shall not engage in any unlawful trade, nor in any way violate the revenue laws of the United States, and shall comply with the laws in all other respects. Such vessels so enrolled and licensed shall not be allowed to transport merchandise or carry passengers for pay. No yacht so licensed shall be liable for any local pilotage or harbor dues under any provision of the laws of the United States, or of any State or Territory. Steam yachts shall, while running, be in charge of an officer duly licensed as master or pilot; and the owner of the yacht, or any competent person approved by the inspectors, who satisfies the inspectors that he is familiar with the regulations prescribed for the running of steam vessels shall be eligible to receive such a license, and such license, when issued by the inspectors in any district, shall be valid and available within the territory embraced in any other district, and without endorsement from the inspectors therein. Steam yachts or launches of a length on the water line of less than thirty-five feet may be run by the master alone without an engineer. Yachts shall, in all respects, except as above, be subject to the laws of the United States, and shall be liable to seizure and forfeiture for any violation of the provisions of this title."

Section forty-four hundred and twenty-six is amended by striking out the whole section and inserting the following: "Sec. 4426. The hull and boilers of every ferryboat, canal-boat, yacht or other small craft of like character propelled by steam, shall be inspected under the provisions of this title. Such other provisions of law for the better security of life, as may be applicable to such vessels, shall by the regulations of the Board of Supervising Inspectors, also be complied with before a certificate of inspection shall be granted; and no such vessel shall be navigated without a licensed engineer and a licensed pilot, except as provided in section 4214 of this act."

Section forty-four hundred and forty-four is amended by striking out the whole section and inserting the following: "Section 4444. No State or municipal government shall impose upon pilots of steam vessels, or owners or masters of yachts, any obligation to procure a State or other license in addition to that issued by the United States, or any other regulation which will impede them in the performance of the duties required by this Title or the provisions of this Act; nor shall any pilot charges be levied by any such authority upon any steamer piloted as provided by this Title, or upon any yacht; and in no case shall the fees charged for the pilotage of any steam vessel exceed the customary or legally established rates in the State where the same is performed. Nothing in this Title shall be construed to annul or affect any regulation established by the laws of any State requiring vessels entering or leaving a port in any such State, other than coastwise steam vessels, or yachts, to take a pilot duly licensed or authorized by the laws of such State, or of a State situate upon the waters of such State."

THE USE OF OIL AT SEA.

THE following particulars concerning the use of oil at sea are given in the North Atlantic Pilot Chart for November:

The use of mineral oil is not recommended, while the importance of carrying a supply of animal or vegetable oil to be used in emergencies cannot be overrated.

Capt. E. I. Arey, of the schooner Jenny A. Cheney, writes: "I used oil with very satisfactory results during the late severe hurricane of Aug. 25 in latitude 31° north, longitude 79° west. The wind having carried away the mainsail, I bent a storm trysail and continued under that sail until it also blew away. During this time the vessel was shipping large quantities of water, the sea being very irregular, nearly every one breaking. After the sails were blown away, finding it necessary to do something to save the ship and crew, I took a small canvas bag and turned about five gallons of linseed oil into it and hung it over the starboard quarter. The wash of the sea caused a little of the oil to leak out and smooth the surface so that for ten hours no water broke aboard. I consider that the oil used during the last and heaviest part of the hurricane saved vessel and crew."

Capt J. H. Parke reports that in 1876, "while in command of the Carrie E. Long, from Sicily to Portland, Me., laden with salt, the ship would have foundered had I not used kerosene oil. The ship, lying to under fore and main lower topsails, did very well until the main lower topsail blew away. This caused the vessel to fall off in the trough of the sea, which boarded her and did great damage. The ship was put before the wind, but leaked so badly and the seas still breaking on board so that the men could not work the pumps, it was evident that something must be done to keep her from foundering. Having picked up two barrels of crude oil on the voyage east I poured this down the closet pipes. This calmed the sea so much that we could go to the pumps and had no trouble afterward. The waves were clearly seen to break all around the oil-covered spot. I fully believe had I not used the oil the vessel would never have stood it, and at least I should have had most of the crew washed overboard. It is my opinion that crude oil is better than kerosene, but the latter will do in an emergency."

Capt. Dawson, master of the British ship Halloween, states that when he was in command of the British bark Zenobia, on a passage from India to London, in February, 1872, off the Western Islands, he encountered a terrific gale with immense sea; wind between E. by S. and S. SE. The Zenobia was deeply laden and labored very heavily, and it was feared that she would go down, so seventy tons of her cargo (seed) were jettisoned. As she still continued to labor heavily, and there seemed but little chance of saving her, two canvas bags, filled with oil and pricked in a number of places, were hung from the weather cathead. As the vessel drifted to leeward the oil spread and enveloped her in a smooth belt. After this she rode easily, the surface of the water being perfectly smooth. The oil used was a mixture of paraffine and colza.

Capt. Robinson, of the English steamer Sussex, furnishes the following report on the use of oil at sea: "In the month of January, 1885, during the prevalence of the heavy gales in the North Atlantic, I used oil bags several times, and found that with a heavy sea on the quarter of the ship they were comparatively useless, as the sea would throw the bags on deck as fast as they were put over. I am of the opinion, however, that in running before the sea, or hove-to, head to sea, they are invaluable." In his experiments with the bags he used a heavy, greasy oil, similar to lard oil, and found that as long as the sea was astern, and he could leave the oil behind, the seas would not break over the stern. He has not tried it hove-to, but invariably found that it would not work satisfactorily in a quartering sea. Capt. Robinson thinks that oil would be of great benefit for small vessels in crossing a bar in a heavy sea. Being put over the bow it would greatly smooth the waves.

Capt. Childs of the schooner Ed. R. Emerson, reports that on Oct. 4, latitude 40° 10' N., longitude 68° 24' W., he passed close to a wreck, bottom up, newly coppered. Although it was blowing hard, the sea for a mile to windward of the derelict was quite smooth, the surface of the water being covered with oil, which had evidently formed part of the cargo.

Capt. Brooks, of the English steamer Nymphaea, writes: "About four years ago I was in command of the steamer Nuphan, of 1,280 tons, loaded with a cargo of kerosene oil and bound for India. While crossing the Atlantic we experienced strong westerly gales, accompanied with very high seas. I had it in my mind to put the ship head on, but having heard that oil thrown on the sea would calm it, I determined to use it. Having plenty of kerosene oil on board, I poured some on the deck. The water coming on board washed it overboard, and immediately the seas became much less, and we ran on without danger until the storm abated. I recommend that all shipowners and masters should have on board their vessels a sufficient quantity of oil, independent of their usual stores, for the express purpose of saving lives and property on such extreme occasions."

Capt. Johnson, master American barkentine Jose E. More, reports when bound to the north coast of Cuba, in latitude 28° 10' N., longitude 73° 30, W., he encountered the October hurricane of 1884. The wind increased rapidly to hurricane force, blowing from N.N.E. to N. and back to N.N.E., falling barometer and heavy sea; the vessel was put before the wind and scudded under lower foretopsail. The waves increasing in violence and size, threatened (after one had been taken on board) to poop the vessel, making their position a most dangerous one, as the decks were filled with water, and it was considered expedient to bring by the wind. Two gunny bags nearly filled with oakum were placed, one on each quarter; on the oakum was poured paint oil, which dripped in the sea. The effect was immediately apparent, the waves no longer breaking in the vicinity of the vessel or giving cause for apprehension.

The master of the British steamer Elstow reports the following gale in which he used oil with good effect: The Elstow left Cape Henry on Jan. 23 for Sligo. On Jan. 27, on the eastern edge of Newfoundland Banks, encountered a gale from westward, increasing in force from W.N.W. Sea run very high and the vessel shipped much water. Fearing to have the vessel to, it was decided to run before it, using oil. Being a firm believer in the use of oil, Capt. Robertson had ready for use oil bags of canvas, punctured in the bottom and sides with large needle holes. Six of these filled with boiled linseed oil were hung over—two in the bow, two in the waist, and two over the stern—and allowed to drip in the water. This had a wonderful effect on the high seas, taking the dangerous curl off them, and preventing so much water from coming on board. Before the oil bags were placed over, the vessel was taking water in over the stern, and also in the waist. Several other vessels that left Cape Henry or the Atlantic coast, and pursuing the same route at this time, were never afterward heard from. One of these vessels, the Ben Tower, a steamer, foundered on 29th, about 200 miles to south and east of the Elstow. The officers of the Elstow attribute the saving of the ship to the use of the oil.

LIQUID FUEL.—The screw steamer Himalaya, of Hartlepool, Capt. Gray, arrived at Granton late on Tuesday evening from London, with a cargo of resin and oil for Messrs. Fleming & Co.'s works, Granton. This vessel has been specially fitted up with large, capacious oil tanks, the oil from which was used instead of coal being burned on the voyage, and was found to work very satisfactorily, the voyage being made in fifty-four hours. The consumption of oil on the voyage was a little over eight gallons per hour, costing about £1 per day, while the cost of coal for that period is calculated to be £7. Besides the saving in coal, a great deal will be effected in labor. Where five firemen would be required with coal two will now suffice, there being with the oil no shoveling of coal into the furnaces required and no accumulation of ashes to remove. A second exhibition of the liquid fuel furnaces on board the Himalaya was made on Tuesday in Granton Harbor, when a large number of gentlemen, representing the principal shipping and oil companies and engineering firms, were present. The fires were lighted up at noon and run till half-past 3, so as to make an opportunity for examining the arrangements in the stoke hole, the working of which was explained by the manager of the Maraiu Oil Company, of Brazil, to whom the ship belongs, and by Mr. Tarbutt, the inventor of the apparatus. The exhibition was a complete success. The steadiness of the fires and the ease with which they were regulated so as to give any required amount of steam, and the entire absence of smoke, even when the fires were forced to their greatest extent, called forth universal approval; and the opinion was freely expressed by practical men that the question of the application of liquid fuel to marine boilers had been practically solved.—*Glasgow Herald.*

ATLANTIC Y. C.—A meeting of the Atlantic Y. C. was held on Dec. 14, at which Mr. Chas. Sweet, owner of the imported Clara, was elected. The Measurement Committee, Messrs. Lawton, Marcellus and Swan, presented their report on measurement, recommending a rating by sailing length, which length shall be taken parallel to the waterline and at a distance of 2 per cent. of the waterline above the latter. The report was accepted and the new rule was adopted by the club. The sloop classes were altered as follows: 60ft. and over, 50ft. and under 60; 42ft. and under 50ft, 35ft. and under 42. The twentieth annual dinner of the club will take place on Jan. 15.

SEAWANHAKA CORINTHIAN Y. C.—A misunderstanding has lately arisen between the trustees of the club, to whom the management of its affairs is entrusted, and Vice-Commodore W. A. W. Stewart, who has been one of the most active members and who has been chiefly instrumental in providing an anchorage for the club. Mr. Stewart has secured for the club an advantageous lease of the present basin, but in arranging the matter with the trustees a difference has arisen which caused him to offer his resignation. The matter is now unsettled, but will probably be amicably arranged without serious injury to the club.

FIXTURES FOR 1886.—The first suggestion of the next yachting season comes to us from the Beverley Y. C. in a list of dates for 1886, as follows: July 17, first championship, Marblehead; July 31, second championship, Swampscott; Aug. 14, third championship, Nahant; Aug. 21, open matches, Marblehead; Sept. 18, fall matches, Nahant. There is no reason why most of the dates for next year may not be fixed at once, and we hope to open the new year with a good list of fixtures for the season.

BRISTOL, R. I.—At the yard of the Herreshoff Manufacturing Company are now laid up the Lucille No. 1, Polly, Ossabaw, Albicore, Stiletto, Ladoga and Lucille No. 2. The latter will have a new triple expansion engine. The Albicore, Com. Forbes, is up for general repairs.

DORIES.—The builders of the dories Little Western, Nautilus, and Centennial, Messrs. Higgins & Giffod, Gloucester, Mass. write us that they will be pleased to answer any inquirers in regard to this class of boat.

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

THE STONINGTON C. C.—Last summer was a very eventful one for the Stonington C. C. Although only organized two years ago, we have a fleet of eleven canoes. The opening regatta brought forth seven canoes, three of which were Class B, and the remaining four Class A. The winners in Class B were Cheemaun and Puritan, and in Class A Flirt and Charis. The following week two championship pennants were sailed for, to be won three times before they become the property of the winner. The Cheemaun proved to be the fastest sailer in Class B, and the Spy in Class A. While the crews of the Cheemaun, Puritan, Wanderer and Charis were camping out, they received a very pleasant call from Dr. and Mrs. Parmele, of Hartford, who were on a cruise, and spent two or three hours with us. In your number of Nov. 26 I notice an article by Mr. Clapham on the width of canoes. I would say that the dimensions of the Cheemaun, which I have mentioned before, are 15' 3" × 42" wide. She is a large and heavy canoe, but is a good sailer, the only difficulty being to manage her, which generally requires two persons. We are looking forward to building a club house next summer, and would like all canoeists to give us a call and we will take care of them.—CHARIS.

WIDE AND NARROW CANOES.

Editor Forest and Stream:

May I be allowed to dip my paddle in the troubled waters of the last canoe controversy? Whe-e-e-w! don't the winds blow in your last issue (Dec. 10, 1885). I don't know but that I will have to stow the paddle after all, hoist double-reefed main and dandy, and try and sail it out even if I do "hike over" and hang on with my toes under the lee coaming. It's exciting, though a little straining.

Mr. Clapham's article in your issue of Nov. 26, 1885, has certainly raised considerable of a breeze—yes, it might be termed a squall if the comments on same by "Class B Canoe," "A. B. C.," "L.," "Katrina," "Surge" and "Captain" are taken up and digested.

I hardly think the remarks of "Class B Canoe" are just. He says, "His [Mr. C.'s] statement that many prominent canoeists have given up canoes for square-sterned boats infers that they have done so owing to the danger, unhandiness and discomfort of the latter." As I read Mr. Clapham's article he infers nothing of the kind. He (Mr. C.) writes, "Many prominent canoeists have long since deserted the canoe for cruising under sail, and have adopted square-stern boats" (for what? Cruising under sail) "simply because the canoe, as at present limited in width, is neither safe, handy, nor comfortable for sailing purposes" (cruising under sail). This is what I think Mr. Clapham meant, and is a fair-minded construction of same. Is it not? And "the deuce"—as they say in Boston—of it is, that Mr. C. stated but the fact.

"Class B Canoe" then asks, "Now, who are the prominent canoeists alluded to? Mr. Bishop, a canoeist, advocates the sneakbox for extended cruises on open waters, but he does not condemn the canoe for its own purposes." I can't see anything in Mr. C.'s article that "condemns the canoe for its own purposes" either. Mr. Clapham says in effect that many have taken to square sterned boats for cruising under sail in preference to the canoe as at present limited by A. C. A. rules. The whole tenor of his article points to that one fact—cruising under sail, and his suggestions are evidently all made with that point in view—cruising under sail. I cannot see that he says build larger canoes, give up your smaller cockle shells or suffer the consequences; but as I look at it he does say, O! ye canoeist, if your present craft is too small for extended cruising under sail why descend to the level of a square stern, when by simply widening your craft with proper other proportions you will have "an honest and speedy little sailing craft, quite capable of thrashing the over-estimated sneakbox to windward or free."

"C. B. C." further says, "Canoeing is the primary school of yachting." Just so. But because it is so is that a reason why "boys and young men" should at once jump from a Class B canoe into a 20ft. sloop or 5-ton cutter?" What objection—I ask the question with all humility—what rational objection is there to the "boys and young men" being modest, and if they see fit or are so situated that they can enjoy extended cruising under sail, discarding their smaller canoe and embracing one of the larger sort, instead of plumping down at once on the unoffending "20ft. sloop or 5-ton cutter?" I don't know that one would love his comely Class B canoe any the less, but he might—yes he might love the larger growth the more—in very rough weather. As "C. B. C." says, "this progression argues nothing against each boat in its place. I am glad he says that, for unless he can find words he must admit that the wide canoe will have its place just the same as a Class A or B canoe, a sneakbox, a "20ft. sloop or 5-ton cutter" will have theirs.

Now let us look at the cases of the "prominent canoeists alluded to," Mr. Bishop discards the canoe in favor of the sneakbox for extended cruises under sail. Mr. Clapham says stick to your canoes, but for such purposes make them larger and you can score against the sneakbox every time, and immediately up jump half a dozen "narrow" canoeists and begin to score Mr. Clapham as if he were an arch enemy of the whole craft. Dr. Neidé discarded the rowboat for the canoe, and he made a wise change too, didn't he? And he made a grand cruise down the swift Allegheny, the turbid Ohio, down the "father of waters" to the Gulf, and thence to Pensacola, showing in a grand way the many virtues of the canoe. You who have read the doctor's interesting narrative of that voyage know how often he used sail, and of the danger he ran while running along the Gulf coast, which, I think, would have been considerably lessened with a larger canoe. However, we will see how the old Aurora gets along with the sneakbox Petrel during the Doctor's present cruise. Mr. Nate Smith did have a most excellent rowboat in 1880-81. He sold it, and I believe he has always regretted it. He thinks much of his 14ft. x27in. Pixie, but when he wants to sail he uses his 17ft. rowboat—see "Dockrat" races. As for Mr. Tyson, "Surge," and even "Class B. Canoe" himself, I wonder if they do not at times wish for larger craft.

"Why is the canoe neither safe, handy nor comfortable; can Mr. Clapham tell us?" From this question one would infer that Mr. C. had made some such statement. Does he? With the idea of cruising under sail in his mind, Mr. C. says: "The canoe, as at present, limited in width, is neither safe, handy nor comfortable for sailing purposes." This is the way I look at it, and the question, as put, and the statement, as made, refer to entirely different things. The question implies that a sweeping assertion has been made, the statement is limited, further Mr. C. must rise on his own account. I don't think a careful perusal of Mr. C.'s letter will show at any point that he says or implies that canoeing has been debased or that the sport is a "debasing one. The question and statement of "C. B. C." on this point are both superfluous and misleading. "Of course a large boat is less cranky, safer and more comfortable than a small one," so "Class B Canoe" says and so I think Mr. Clapham holds when he advises such for extended cruising under sail. So "Class B Canoe" and Mr. Clapham agree after all. Well! By the most complicated foot-steering gear ever invented; that is funny. "But such a boat would be utterly useless, as far as two-thirds of our canoeists are concerned." Just so, in fact, I would amend it and make it seven-eighths but why, my dear Class 'B' man or Class 'A' man, as the case may be why bar out the other eighth?

If that small minority believe that they will derive more benefit, sport and pleasure from the larger canoe, why bar them out? Why admit them to membership—accept their fees, accept their gifts in prizes, accept their money subscription toward the International Cup—and then calmly sit down with "Surge" and say, "It is not at all likely that the Association would consent to such an alteration of rules as would be required to admit to their races such craft." The Association have made changes in the rules before, have they not? Their laws were not framed like those of the Medes and Persians, were they? I sincerely hope that all are not "narrow" minded, for what will be of "wider" views do then, poor thing? All that "Class B Canoe" says regarding the advantages of the canoe of his class is correct. No one, I think, denies its many good qualities. No one, I think, having once tasted the sweets of canoeing, will give it up entirely. But when we come to discuss the merits of the canoe craft *in esse*, we get "way off" from the point.

The questions before the house are, as I take it: 1. What is the objection to a canoe of larger class than the A. C. A. rules now define? 2. What is the objection to making changes in the A. C. A. rules to meet that class of larger canoes—or whatever you may call them?

"A. C. A." asks Mr. C. various questions which may be answered by him or not. I hope he may, for I want to learn something about these wider canoes. From my limited knowledge, however, I would make a "guess" that the cost of such a craft would be less than a Rushton Mohican No. 2. The weight with full outfit ought to be kept under 140 pounds. I think the railroads might be induced to handle her as they now do canoes, and I also think that it would not take any more men to handle her than it would to handle a canoe of same weight.

It looks very much as if the numerous reviewers of Mr. Clapham's letter had read it through the same spectacles. Because the larger craft is unfitted for running rapids, cruising down smaller streams, competing in paddling races, stowing away in a garret, or being picked up—because she has none of these qualities—there is no good in her. Who ever thought of claiming any of the above good qualities for the larger canoe? No one that I know of, and I doubt if "Class B Canoe," "A. C. A." "L.," "Katrina" or "Surge" can point to any one as making such claims for the wider boat.

Suppose one should ask if a Class B canoe would be a safe, easy, comfortable boat for an extensive cruise on, say for instance, the Sound, or the Chesapeake, or the lakes, or for everyday use on the Jersey coast. There would probably be a number answering affirmatively. The question I want to put is: For such purposes would not a larger canoe be safer, easier and more comfortable? Of course it goes without question that these larger boats lose one essential of a canoe, *i. e.*, paddling—oars will have to be used. But Mr. Clapham's reviewers lose sight of the point that these larger craft are not put forward as "paddleable sailing" or "sailing paddleable" canoes, but—simply as sailing canoes—that and nothing more—boats preserving all the good qualities of the smaller canoe model, canoe rig, canoe handiness and canoe beauty—as being a better thing for the purpose than the sneakbox. The pretty romance of "L." about cruising down one of our rivers only goes to show that in canoeing, as in everything else, "there is a place for everything and everything in its place."

In "Katrina's" home waters it may be that the larger sailing canoe, as suggested, would be out of place. But there may be localities where it would be looked upon as very much in place. "Captain," of Chicago, seems to think so, and I dare say there are others—good A. C. A. men, too—who in their "inner consciousness" think the same.

"Surge" asks, "But how about picking her up and carrying her into a boat house up a steep bridge at low water?" "Surge," how about "picking up" a Mohican No. 2, eh? The writer has seen dozens of canoeists together in camp at different times, but in all the number there were very few capable of such an act. If a man can't haul his

canoe up a bridge, he's not going to attempt to "jackass" it up. I don't think either he will have to anchor it out. That 31½in. canoe mentioned by "Surge" must have been an older sister of Tramp, as the latter is by all odds the weightiest canoe (?) I ever struck. If so it was, I am sorry for the owner's financial loss; but sincerely trust her bleaching bones may forever rest in peace. My own experience leads me to think that "Surge" exaggerates unintentionally the difficulty of handling these large canoes. It certainly was not size, but excessive weight, that was at fault in the case of the derelict referred to. Take my own canoe, for example, 16ft.×32in. "Hold on!" you say, "that is not a racing canoe—you are outside the racing limits of the A. C. A." Not a canoe, eh! Why not? Because she happens to be 1½in. wider and 12in. longer than a Mohican No. 2? Or is it because she is 2in. wider than the A. C. A. rules prescribe for a canoe of her length, which? In everything else she holds to the A. C. A. definition, she is both rowable or paddleable—the latter preferred—and sailing, so until proved to the contrary, I will call her a canoe. Take her, for instance, with the metal airtanks, centerboard, rudder, masts, sails, seats and paddles, she must weigh close to 125lbs., probably more, and yet I have never had any trouble in getting in or out of the boat house, and at times up as steep a bridge as "Surge" is ever forced to use, I think.

This talk of getting rid of the "useless paddle," "anchoring our boat out to save the trouble of carrying her into the house," "wedging the mast in," "rig the sails with gaff and boom," the canoe "vanishing," etc., etc., all this has greatly the effect of affectation. The canoe is a fact, a happy fact for me, and with me it will stay, but there is no rubbing out that also fact, that there are canoes and canoes. Then why not bring all these canoes into the happy circle of the A. C. A.?

In the comments on "Long Shanks's" article on "Classification of Sailing Canoes," the editor uses the words "as it is the policy of the A. C. A. to encourage all legitimate cruising craft." I don't know whether he speaks "by the rule" or not, but that is the way it should be; and yet, from the other articles from facile pens closely following the above, there would seem to be some who are not anxious to live up to this broad principle of good sense and good fellowship. I, for one, would much like to hear from some of the Eastern folk who have the larger canoe in use, and learn from them of her good and bad qualities.

And now, Mr. Editor, while I am at it, and since you invite "views" on "Long Shanks's" article, let me have an inch or so more of space. The Association rule requires that "a canoe, to compete in any of the races of the A. C. A., must be sharp at both ends, with no counter stern or transom, and must be capable of being efficiently paddled by one man." This is the broad rule as laid down, but it don't amount to anything—is utterly valueless, and besides misleading; for the rule goes on to say in the next paragraph that, to compete in various races, the canoes must be limited to certain sizes for certain classes, which is sensible and proper, but is still inconsistent, inasmuch as the largest size specified—Class B—is not as large as may "be capable of being efficiently paddled by one man," as I know from experience.

With "Long Shanks" I ask, why bar out any canoe that meets with the requirements of the Association? or rather, why should the Association say one thing and then turn right around and say they mean something else? If they don't mean it why promulgate it at all?

"Long Shanks's" schedule of the classes as they would be under the rules as proposed by him, brings out very forcibly to me the inconsistencies of the present rules. There are two canoes in his lists that belong to members of "our" club. At present they are both in the same class and yet one has no more chance sailing against the other than the Guenn had with Mr. Clapham's sharpie—in other words, it had no business there. In "Long Shanks's" list they are classed in different divisions and nearer I think to fair rating. Yes "Shanks" old man!—if you will allow that from a stranger—I think you have put it pat, and now if you, or some one else "which hes influoence" would only speak a word in good fellowship for that canoe of larger growth which has raised such a "boiling of troubled waters" and tack on a Class C that would take the ultra wide canoes keeping them by themselves so that the smaller craft would get no hard knocks in bumping against them, methinks it would be a long step toward the consummation of that broad policy as stated by the editor "the policy of the A. C. A., to encourage all legitimate cruising craft."

Methinks also that a salt-water "meet" wouldn't be a bad thing to show up the good qualities of the big un's. What say you? HAL.

NEWBURGH, N. Y.

THE ROYAL C. C.—The autumn meeting of the Royal Canoe Club was held on November 24, and the following officers were elected: Commodore, H. R. H. the Prince of Wales; captain, J. Macgregor (Rob Roy); mates, J. W. Clayton and G. Herbert; cook, F. F. Tuckett; purser, C. J. Wright; secretary, T. G. F. Winser; committee, the Earl of Caithness, the Hon. A. F. Kinnaird, A. B. Ingram, Dixon Kemp, E. A. Leach, Major Roberts, Claud Scott, E. B. Tredwen, and W. E. Graham. On December 8 an adjourned meeting was held at which several proposed changes in the rules were acted on. Mr. E. B. Tredwen, seconded by Mr. W. E. Graham, proposed to alter rule 28 to read: "Length not exceeding 20ft., with a limit of 2ft. beam for that length, the beam may be increased ¼in. for each full inch of length decreased, until the limit beam of 3ft. is reached." Mr. Tredwen also proposed to adopt the clause from the A. C. A. rules allowing a beading of 1½in depth and ⅜in. thickness, seconded by Mr. W. Baden Powell. The following motion was introduced by Mr. Baden Powell and seconded by Mr. W. E. Graham: "Any member who has won three first prizes in club races of the same denomination shall be considered a 'senior,' and shall thereby become ineligible to take any prize given by the club during 1886—except in challenge cup races—in a race of the same denomination as that in which he is a 'senior,' the prizes given by the club going to the juniors. In any race, however, in which a 'senior' competes and wins he shall receive a recognized club flag, the 'senior flag' consisting of a blue silk flag with club device and year date of his race thereon, and also any presentation prize which may be attached to such race. In the case of a challenge cup race the winner shall be presented with a distinctive club flag of silk, bearing a suitable device, with date of race thereon. The 'senior' qualification is to include the races of 1885. All three motions were passed, but a motion of Mr. T. F. Knowles to abolish side deck flaps was voted down, as were several other motions, to allow water ballast, to limit sail area and weight of centerboards.

THE A. C. A. INTERNATIONAL TROPHY.—The following subscriptions have been received since last week: J. L. Greenleaf $1, N. H. Bishop $1, Wm. Lowey $2. Total to date, $64 Subscriations of $1 each may be sent to the chairman of the committee, Mr. Wm. Whitlock, Nos. 37 and 39 West Twenty-second street, New York.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

ED.—The one bearing your own name will shoot as far as you can aim straight.

SUBSCRIBER.—Spartanburg, S. C.—Write to Capt. C. E. McMurdo, Charlottesville, Va.

CANADIAN, Brockville.—We cannot compare the boats from the dimensions you give. The cup is given by the N. Y. C. C., and as holders they hav echarge of the races. There would not be time for the races at Grindstone, and an international race will be sailed there as matters are.

W. L. M., Lynn, N. Y.—We do not know the address of the Manhattan Arms Company.

L.—We have seen some cross-bred English and Irish setters which were capital field dogs.

G. H. P., Middletown, Conn.—The E.K.C.S.B. number of Dr. Jarvis's champion Elcho is 5,129.

S. S., Lowell, Mass.—1. The English setter bitch won second at Lowell, in 1882. 2. We have no record.

J. W. M., Tom's River.—The design you refer to is by Mr. Edward Burgess, No. 7 Exchange Place, Boston. Write to him for full particulars.

CHICAGO.—1. Can a person properly enter a dropper in a pointer class? 2. Could a person enter a protest against such entries? Ans. 1. No. 2. Yes.

L. F. F., Boston, Mass.—The subject has been so fully discussed already that it is not advisable to reopen it now. The arm will be a serviceable weapon in the country you name.

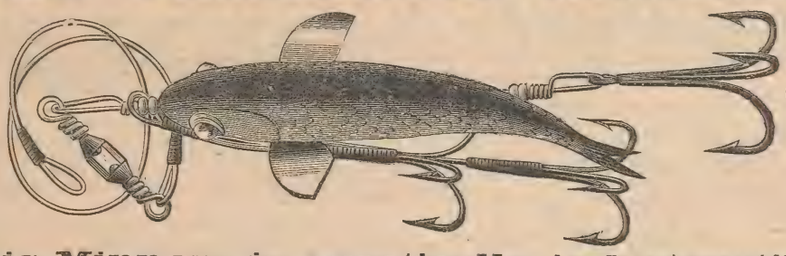
DICK, Brookfield, Mass.—The floats for fishing lines are a regular article to be had of tackle dealers. Write to any of such advertisers in this paper. The netting cannot be described; consult the catalogue of some of the net manufacturers.

H. M. D., Denver, Colo.—A newspaper reports that a Nebraska observer has discovered that the prairie dogs supply themselves with water by digging wells, each village having one, with a concealed opening. He claims to have found one such well 250 feet deep, approached by a winding staircase. What is your opinion? Ans. See discussion of the subject in recent issues. How did the man measure the well?

PENN.—1. Is a setter dog of any use in hunting rabbits? 2. What season and what time of night are best for shooting muskrats? 3. Can a resident of Pennsylvania shoot ducks in any manner in Cecil or Kent county, Maryland, during April? Ans. 1. Yes, a setter can be used for that purpose, but it is an unworthy use to put a setter to. 2. Moonlight nights in the late fall. 3. The Maryland law forbids wildfowl shooting after March 31.

G. H. S., New York.—A spring step to the mast was tried on canoes in New York and Toronto several years since, but was abandoned after a series of careful tests, as the benefits were very slight. We have never tried the reel referred to, but such appliances are unsafe in a small boat, as in the event of a failure to work properly a capsize must follow. Two or three battens of moderate size are most effective in keeping a sail flat. The sail hoist mentioned is said to answer very well, and is used on a number of small yachts in the East.

M. Hanover, Pa.—I have an 8-pound, 12 grain, choked. I load 3 drams powder, one card and two heavy wads on powder, and 1 ounce No. 8 shot for birds, but find the gun makes too close a pattern. Our shooting is in cover that requires quick shooting, and birds hit at 30 yards and inside—as I am accustomed to shoot—are thoroughly smashed and entirely unfit for use. Can I modify the loading to give me a wider pattern, or must I change the bore of the gun. Have tried various methods of loading, but find the choke works the same. Ans. You will probably find it necessary to take the choke out.



FIVE DOLLARS A YEAR for all professional employments secures $1,000 insurance with $5 weekly indemnity in the Travelers, of Hartford, Conn. Paid accident policy holders $949,000 in 1884.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

THE FOREST AND STREAM PUBLISHING COMPANY takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the eld of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new I nternational Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.
VI. Keel Catboat Caprice.
VII. Caprice—Sail Plan.
VIII. Keel Catboat Dodge.
IX. Catboat Dodge—Sail Plan.
X. Open Boat Cruiser.
XI. The Cruiser—Sail Plan.
XII. Open Boat Trident.
XIII. A Skipjack.
XIV. The Centerboard Sloop Gleam.
XV. Gleam—Sail Plan.
XVI. The Centerboard Sloop Midge.
XVII. Light Draft Cutter Mignonette.
XVIII. Mignonette—Sail Plan.
XIX. Single-Hand Cruiser.
XX. Light Draft Cutter Carmita.
XXI. The Dart.
XXII. The Boston Sloop Neva.
XXIII. The Boston Sloop Nyssa.
XXIV. Keel Sloop Columbine.
XXV. Columbine—Sail Plan.
XXVI. The Keel Sloop Alice.
XXVII. The Gannet.
XXVIII. A Compromise Sloop.
XXIX. The Itchen Cutter Daisy.
XXX. Daisy—Sail Plan.
XXXI. The Cutter Vayu.
XXXII. The Cruising Yawl Windward.
XXXIII. Windward—Accommodation Plan
XXXIV. The Windward—Sail Plan.
XXXV. The Cruising Yawl Aneto.
XXXVI. The Single-Hand Yawl Deuce.
XXXVII. Deuce—Sail Plan and Construction
XXXVIII. The Cutter Petrel.
XXXIX. The Petrel—Sail Plan.
XL. The Cutter Merlin.
XLI. The Merlin—Sail Plan.
XLII. The Cutter Rajah.
XLIII. The Cutter Yolande.
XLIV. Yolande—Cabin and Deck Plans.
XLV. A Single-Hand Yawl.
XLVI. Single-Hand Yawl—Cabin and Deck Plans.
XLVII. S. H. Yawl—Rig and Construction.
XLVIII. The Cutter Mamie.
XLIX. The Mamie—Midship Section.
L. The Mamie—Sail Plan.
LI. Six-Beam Cutter.
LII. Six-Beam Cutter—Sail Plan.
LIII. The Cutter Surf.
LIV. The Cutter Surf—Sail Plan.
LV. The Cutter Surf—Midship Section
LVI. The Cutter Surf—Cabin Plans.
LVII. The Cutter Spankadillo.
LVIII. The Cutter Madge.
LIX. The Madge—Ironwork.
LX. The Schooner Gaetina.
LXI. The Nonpareil Sharpie.
LXII. The Cynthia.
LXIII. The Cruising Sneakbox.

A folio volume (size of page 14½x12½ inches), printed on paper specially manufactured for it, and with great beauty of execution and finish in every detail, making a volume vastly superior to any other work of the kind ever published. Pages 370, with 136 plate pages additional, or a total of more than 500.

PRESS OPINIONS.

New York Times, Nov. 1.

The author, Mr. C. P. Kunhardt, is well known to all yachtsmen through his writings in behalf of better boats and a higher standard of skill while in charge of the yachting department of FOREST AND STREAM, and his hearty devotion to the sport, backed by a thorough scientific training, fit him peculiarly for the task he has so well accomplished. The conception of the work is a happy one; the subject is treated plainly and practically; fine spun theories and elaborated calculations are omitted, and only such results are given as will be useful to any intelligent yacht sailor or builder.

New York Evening Post, Oct. 24, 1885.

This book fills a blank in American yacht literature, and will be found a valuable addition to the libraries of our American yachtsmen. The subject matter, although covered in a measure by such works as Dixon Kemp's "Yacht Designing" and his "Yacht and Boat Sailing," is presented in more attractive form, is much condensed, and is procurable at less than half the cost of these volumes. It is practical throughout—practical in the treatment of what is popularly called theoretical. . . . We can recommend the book, notwithstanding its title, "Small Yachts," to all yachtsmen without reference to the size of their vessels, existing or in prospect.

Boston Herald, Oct. 4, 1885.

One of the best publications on small yachts that has came from the press for some years. . . . The volume as a whole commends itself to the yachtsmen or to the landsman who seek information on the subject of building, rigging, fitting out and sailing yachts.

American Canoeist, October, 1885.

To the man interested in boats—building, rig or sail—Kunhardt's book will be as interesting as a novel. It will not be read through once and then shelved, but will be kept in a convenient place for easy reference. It cannot get out of date.

New York Commercial Advertiser, Oct. 6, 18 5.

This collection [the plates] is a concise history of yachting with small boats at the present time, and has a value which is not easily overestimated. . . . The many merits of the book will commend it to all who are interested in yachting and to all who want to be.

San Francisco News Letter, Dec. 5, 1885.

The largest, most complete and handsome volume upon small yachts shat we have seen. . . . The whole scope of yachting is ably handled.

The Germantown Telegraph.

It is beautiful in workmanship, abundantly illustrated and proves itself on every page the work of a writer thoroughly conversant with and enthusiastic about his subject. . . . It is to those who love yachting for its own sake and are intent to be their own masters that this work will appeal most successfully, for it shows how to build and run a small yacht, which will give all the sport one wants and make a true sailor of its owner.

New York Herald, Dec. 12, 1885.

There is a growing tendency among those who delight in "a whiff of the briny" to own a small and staunch cruiser, and to sail either single-handed or with a nautical shipmate. To those whose fancy lies in that direction, but who have not yet achieved their ambition, we cannot conceive of a better book than this of Mr. Kunhardt. There are numerous large plates and designs of every kind of boat, which can be recommended as reliable. There are sail plans and rigging plans, and there are also many shrewd suggestions and hints which the old seadog as well as the young tyro may read with advantage. The Forest and Stream Publishing Company issue the book in a style which does them great credit.

Now Ready. Price, postpaid, $7.00.

For Sale by the Forest and Stream Pub. Co.

J. N. DODGE,

276 & 278 Division Street,
Detroit, Mich.

Manufacturer of Cedar Decoy Ducks of all kinds. First quality, $9 per doz.; second quality, $7 per doz.; third quality, $5 per doz. Also Geese, Brant, Swan, Coot and Snipe Decoys. Duck and Turkey Calls. Decoys made like any pattern furnished without extra charge.

St. Clair Flats Pattern, much larger than the bird; less than one-third the weight of solid decoys. The exact position of a duck on water at rest and unalarmed. The lightest and best decoys made. Heads in different positions; glass eyes, hollow and flat bottom. Do not require weighting to keep them upright. Painted the exact imitation of the natural bird. $15 per doz. Sold by all gun dealers, to whom I give a large discount. If your dealer does not keep them I will send, freight paid, on receipt of price. Illustrated price list free. I also make solid decoys after the Monroe Marsh Pattern, semi-flat bottom; price $11 per doz.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in 1885 we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM's constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This in the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table, We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

GOOD THINGS IN STORE FOR 1886.

Among the papers and sketches to appear are the following:

To the Walled-in Lakes.

Sketches of exploration and hunting in the Northwest with the Blackfeet and Kootenays. By "Yo."

Cruise of the Coot.

An account of a voyage alone in a single-hander from New York along the Atlantic seaboard to Florida. By C. P. KUNHARDT.

Hunting in the Himalayas.

Scenes and incidents in the life of an Indian forester. By "SHIKAREE."

Falcons and Falconry.

An introduction to the sport of hawking, with illustrations, drawn from nature. By R. W. SEISS.

Game Preserving in Britain.

A comprehensive series of papers on practical game preserving in Great Britain, with descriptions of the game birds of the British Islands, and sketches of sport. By "MOORMAN."

Scrimshawing.

A popular account of how a whaler spends the idle hours aboard ship. By JAS. TEMPLETON BROWN.

The Lower Forms of Life.

A continuation of the admirable series of essays on the beginning of animal life. By JAMES STOLLER.

Studies in Botany.

New chapters on plants and plant life, written and illustrated from nature. By A. W. ROBERTS.

Land and Water Experience in Florida.

New chapters of experience on the Gulf Coast. By "NESSMUK."

Cruise of the Pilgrim.

A delightful description of a summer voyaging on the Atlantic in the cutter yacht Pilgrim. By W. H. WINSLOW.

Days with the Barmacide Club.

A vivacious account of angling luck, good and bad, in Adirondack waters, whose name, latitude and longitude the author refuses to disclose. By MILLARD

Camps of the Kingfishers.

A further relation of what befel the Kingfishers in their sojourn at Carp Lake, Michigan.

Camp Flotsam.

A new series of the chronicles of the outers at Camp Flotsam, with accounts of bass fishing in Canadian waters. By WAWAYANDA.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

The Forest and Stream Publishing Co. will send post paid any book published on receipt of publisher's price.

ITHACA GUN CO., Ithaca, N. Y.

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞Illustrated price lists sent upon application. Address

H. M. QUACKENBUSH, Manufacturer, Herkimer, N. Y., U. S. A.

NOTE.—We stamp our name plainly on each gun we make. Send for catalogue B.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.
LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.

WILSON PATENT ADJUSTABLE CHAIR With thirty changes of positions. Parlor, Library, Invalid Chair, Child's Crib, Bed or Lounge combining beauty, lightness, strength, COMFORT, simplicity. Everything to an exact science. Orders by mail attended to promptly. Goods shipped C. O. D. Wilson Adjustable Chair Manufacturing Co., 7 West 14th st. N. Y.

READING PORTION

Mention this paper. Send stamp for Ill. Circular.

FLORIDA.—Sportsmen going south this winter should take with them a roll of **Dodge's Ferrule Cement.** It is just what you will want if you break a fishing rod. Ask your tackle dealer for it, or send 25 cents for sample by mail to A. B. DODGE, Manchester, N. H.

Wanted.

Attention, Gunmakers!

I want a position with a live, go-ahead concern that has a line of good goods and desires to bring them to the notice of the user and the trade.

I can talk gun and use one in field or at trap, have seven years' acquaintance as salesman, manager, etc., with the hardware and sporting goods trade, big and little.

Am at present treasurer and manager of a manufacturing company, but desire less confining business.

Address, GUN,
Care of Forest and Stream.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, DECEMBER 31, 1885.

VOL. XXV.—No. 23. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. For sale by Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Davies & Co., and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

SENATOR VEST'S PARK BILL.

THE bill introduced recently by Senator Vest, for the better protection of the Yellowstone National Park, will be found in another column.

Those of our readers who have followed the history of the reservation since it first came into prominence in connection with the Hatch-Hobart grabbing project, will see much in this bill to approve and also some points to criticise. It appears to have been drawn without a knowledge of the facts brought out by Mr. Phillips's report on the Park, which was printed in our issue of Dec. 3, and yet it provides for several points much in the way which the Special Agent recommends.

We are sincerely sorry to see that the increase in the size of the Park is limited by the bill to the parallel of 44°. It appears to us very desirable that it should be extended about twenty miles further to the south.

By making the southern boundary the parallel of 43° 40′, the reservation would include a portion of Jackson's Hole, Jackson's Lake and a considerable area of wet and springy territory from which the forests should under no circumstances be removed. This region pours into the head of Snake River a great volume of water, and ought by all means to be protected. The country, as we have before stated, is entirely without value for settlement. It is a region too cold for farming; the long winters and deep snows make it unavailable for stock growing, and no mineral deposits of any importance are known to exist there. It is, however, a country of wonderfully majestic scenery, and as such belongs properly within the Park.

Mr. Phillips recommended and we urge that the shooting at, wounding, capturing or killing of any bird or animal within the Park be prohibited, and we should be glad to see Section 4 of the present bill changed in this respect. The noxious animals found in the Park, such as bear, wolves and panthers, are not dangerous to travelers, and the permission to kill them furnishes an excuse for the presence of hunting parties within the Park. Such parties may be tempted to kill game illegally. The provision of the same section which refers to transportation of game is very much weakened by the words, "knowing, or having reasonable cause to believe, that such animals, birds or fish were" * * The transportation of game or fish killed in violation of this act should be forbidden, and it should be for the carrier to prove that the game or fish was lawfully killed.

We should be glad to see the number of the Park police increased from fifteen, as here provided for, to twenty-five.

The provision which authorizes the appointment of a Commissioner to try offenses against the regulations and to hold in the case of felony, is excellent; but it is perhaps doubtful if one Commissioner could do all the work required.

On the whole, the bill is much better and more nearly adequate than any that has yet been introduced.

WHICH IS IT?

HAS every man the natural right to kill game, say deer in the Adirondacks, when and in what manner he individually may please, without regard to the community at large?

Or is the liberty to kill that deer a privilege accorded by the community to the individual, and justly accompanied with certain restrictions as to time and manner?

Is the individual to regard the game law as a harsh and unwarranted interference with his exercise of a natural right?

Or is he bound cheerfully to respect the law as a proper rule for himself because it is in the interest of the community?

Is it becoming every year more evident that private and public opinion do not sanction the fundamental principles upon which game laws are based?

Or is the tendency in this country that the obligations of the individual to govern his conduct in the woods with some reference to other people are better understood and recognized?

These are pertinent questions just now. We have asked them, not to give answers to them so much as to suggest that they may furnish subjects for profitable consideration.

THE EXTENSION OF THE A. C. A. CLASSES.

THE discussion over wider canoes that has lately appeared in our columns has brought out suggestions from several that a class be formed to admit these boats to the races of the Association. Some of our correspondents take the ground that because the first clause of the rule says that a canoe must be sharp at both ends and without counter-stern or transom, and capable of being paddled by one man, that any boat fulfilling these conditions is entitled to an entry; but to class them all would make a set of rules so complicated and entail so much work that it is impracticable. Any change must be in the direction of additional classes only of such size as shall be proved to be most desirable, and the fewer classes the better.

For two years, until it was forced upon it, the new Association avoided the question of classification, and stumbled along as best it could, until the many sizes of boats entered and the consequent confusion compelled some action. A comprehensive scheme of classification, embracing not only existing canoes, but providing for larger boats, was adopted and used for a season, when the new regatta committee proposed the scheme which, altered and amended by trial, is now in practical working. At the time this latter scheme was proposed, 1883, there were no canoes larger than 16 feet long and 33 inches wide, the latter beam with only 14 feet length, that claimed a representation in the races, and the larger boats were comparatively unknown. Almost all existing canoes then came near the limits of Class A or Class B, and the committee dealt only with these boats, without any reference to the future other than a proposal to add a class for larger canoes as soon as the latter were sufficiently numerous. The latter have now increased to a considerable number, but of a diversity of sizes and models. To classify them so that every one that comes may have a race is impossible, the only course is to proceed as with the smaller boats, to form a Class C that will embrace a majority of the boats now outside the limit, with such limits to the new class as may seem advisable, and then owners must build to these limits. What the new class will be we cannot now consider, but it is a subject for discussion among those who wish its establishment. It was at one time proposed to admit not only canoes, but all cruising boats within a broad limit, to a place in the Association, giving a race to each class as soon as enough of them appeared to justify it, but still keeping the canoe racing intact. This scheme met with approval from many, but was killed by the opposition of one canoeist.

The object of the American Canoe Association is and always has been to encourage cruising in small boats, and while we cannot of course speak officially, we believe that the introduction of a class of legitimate cruisers of larger size would meet the approval of most of the members. The work of promoting canoeing and developing canoes must of course be the main feature of its policy, but there is nothing in that antagonistic to the existence of the larger boats.

SENSIBLE GAME CLUBS.

ONE of the most inexpensive and satisfactory methods of securing good quail shooting is the plan adopted by clubs and associations who lease the shooting privileges of a number of adjacent farms.

Instead of buying the land, they simply stipulate that they shall be given the exclusive privilege of shooting upon it. The individual expense is slight, for it is divided among a number, and a comparatively trifling sum is sufficient to secure the co-operation of the farmer. Each land-owner becomes at once interested in the welfare of the birds on his farm. His agreement with the club calls for no expense nor exertion on his part beyond the simple posting of his land and the exclusion of trespassers. If he happens to be in a locality where lawless gunners have broken down his fences and harried his stock, he is glad to shut them out and to have in their stead sportsmen whose interests are recognized as identical with his own.

A club adopting this plan can insure the thorough protection of its leased territory, and provide sport which is easily accessible, calls for no great outlay for railroad fares, and is not attended with the provoking uncertainty which enters so largely into all excursions to distant game grounds.

This co-operation of sportsman and land owner has been practically put to the test. It may be accepted as one solution of the game problem. The day has gone by when a majority of the sportsmen of this country can expect fair shooting without having made some such provision for a protected shooting ground. The sooner we all recognize this and act on it the better.

THE ADIRONDACK DEER LAW.

WE print to-day a number of letters from correspondents representing different shades of opinion about the non-hounding deer law, which has been in force in the Adirondacks this year. From these communications it appears that in certain parts of the North Woods the law has been received with favor, and has been respected and has apparently worked in a manner to give satisfaction to the people. In these localities, because approved, it has been enforced. In other parts of the woods it has been violated because the local sentiment was against it. Wherever the law has been given a fair trial it has amply established the wisdom and utility of the abolition of dogging. The conclusion of the whole matter is that the law has worked for the public good wherever given a fair trial; it has been barren of the best results where only respected in a half-hearted way or openly and persistently set at naught.

Interested and ill-informed newspapers like the Boonville *Herald* have strenuously endeavored to make it appear that there has been an unusual slaughter of deer by market still-hunters. The purpose is to deceive the public into the mistaken notion that the still-hunters alone succeed in killing more deer in a season than were ever killed by still-hunters and hounders put together. Such a notion is very silly, but it is just by the use of such senseless arguments that the advocates of club-killing deer bolster up their side of the question

The truth is, however, that the killing of Adirondack deer in 1885 did not begin to compare with the killing in former years when the woods were full of hounders who came in from outlying towns, and systematically laying out their campaign, putting their boats on different lakes and their dogs on the trails leading to these waters, cornered the game, shot it in the water or clubbed it to death and carted out wagon load after wagon load of venison for winter meat.

The law is a good one. It should remain on the statute books.

THE FOREST AND STREAM'S RIFLE TRAJECTORY TEST.—The figures of the last tests are given in our shooting columns to-day, and next week will be presented a review of the trials and a tabulated summary of the entire test. The report in full will be published in book form; and the numerous letters we have received suggesting such a permanent form for the report lead us to believe that the trajectory volume will be welcomed as an addition to the rifle literature of the day.

TO THE WALLED-IN LAKES.

IV.—LAZY DAYS.

THE sun was shining brightly into the tent door before we rolled out of our blankets the next morning. We had been thoroughly tired out the night before, and the effects of our climb were still felt. As I walked out to the wagon to grind the coffee I was as stiff and sore as if I had been taking my first horseback ride in twenty years. Our coffee mill, by the way, was rather primitive in construction, and a description of it may interest some of your readers who always go provided with the conveniences of life. The engine consisted of three parts; first, a wagon tongue; second, a small rag; third, the axe. When the coffee was to be ground, the person who was to perform this operation provided himself with two tin cups, one of them full of coffee berries, the other empty, and with these in one hand and the axe in the other betook himself to the front end of the wagon. Here, after placing the cups in a safe position, where they could not be knocked down or upset, he bestrode the wagon tongue, and seating himself upon it, put a small portion of the unground coffee in the rag, and twisting it up so that none could escape, proceeded to pulverize it by pounding it with the back of the axe on the tongue. As soon as one ragful was made fine enough, it was placed in the empty tin cup and replaced by a fresh supply of berries, the operation being repeated until all the coffee was ground. The coffee mill in question has its advantages. Its parts are in a certain sense interchangeable. At all events they are easily replaced. For the wagon tongue you can say wagon tire, or flat stone, or hard piece of log, while the axe may be replaced by a stone, a hard stick, or even the butt of a rifle stock. It is true that a civilized coffee mill has the advantages of saving time, labor, patience and coffee, but we had absent-mindedly neglected to provide this piece of camp furniture, and so had to do our best without it.

While I was hammering away at the wretched coffee, which very obstinately refused to be ground, I turned over in my mind what we had better do during the day. I felt rather too stiff to undertake another day on the mountains, and determined to just loaf about camp all day long.

In theory loafing is a most delightful way of passing the time, but in practice it fails to satisfy. As long as one has something to potter over—some pretense of an occupation—he does very well. But after the rifle is wiped and the frayed silk on the middle joint of the rod neatly whipped, the rents in clothing mended and the broken strings replaced on the saddle, he becomes uneasy. A pipe or two, smoked as he reclines stretched out at full length on his blankets, fails to soothe, and he rises, walks out of doors, stretches in the warm sunshine, yawns, and then concludes that he must do something. This was just what happened that warm September morning. By 11 o'clock I heartily wished myself on the mountains again, but as it was too late to think of making the climb, Appekunny and I walked off along the trail to the inlet. I carried my rod and he his shotgun.

As we crossed the little stream within a short distance of the camp, a ruffed grouse hopped from the ground in front of us into the lower limbs of an alder, where she sat not six feet distant and looked at us. There was at once a division of opinion as to what course should be pursued with the game. On the one hand it was suggested that the bird's head should be promptly shot off. Against this it was urged that she was ragged and almost featherless, and had probably just reared a brood, and this being the case she would not be fit to eat, and that except for food it was not worth while to kill her. The bird sat there like a judge and listened with great gravity to both sides of the argument, but as she said nothing, it is presumed that she reserved her decision. We could not agree as to what should be done, and so passed on, leaving the bird sitting there turning her head from side to side as if somewhat perplexed by the reasons that had been offered on both sides.

Passing along up the ridge and around the point of the hill, we paused for a while to look out over the lake and up toward the grand mountains to the west, south and east. The shoal waters of the shallow bay at our feet, which swept in a beautiful curve from the point near camp to the inlet, were dotted with hundreds of ducks, and further out, where they looked blue and deep, floated a couple of loons. Two or three snowy gulls rested on the sand shoals. It was as restful a scene as one would wish to look upon.

About us on all sides towered the grand mountains, sloping up for some distance in timbered acclivities, and then above these again, rising in abrupt black walls that seemed insurmountable. Most of the mountains near at hand seemed square-topped, or worn into pinnacles only the ends of these walls, but further away we could see jagged spires that ran up like needles, far above their fellows. Snow lay upon all the higher mountains, but that which had fallen since our arrival had all disappeared.

Still following the trail, we kept on round the hill and down nearly to the lake level, and then crossing a little stream proceeded cautiously through the underbrush to the lake shore. As I parted the bushes that grew above the beach and peered out through the leaves, I saw a flock of widgeons close to me on the water. It was pretty to watch them as they swam about, feeding or playing with each other, so near to me that each motion, even to the ruffling of a feather or the twitching of an eyelid, was plainly visible. I watched them for some little time, and then the thunder of the double barrel woke the echoes of the hills, the birds disappeared behind a point, and four little gray feet kicked plaintively above two spots of white that rose and fell on the dancing waters. The little dogs quickly retrieved the birds, and we walked on along the beach to the inlet. A wide, swift brook hurries down from the mountains on the southeast, between spruce-clad hills, and enters the inlet flat about half way between the lakes. This stream pours its waters into the lake at the upper side of the bay, and on the sand shoals at its mouth we saw a moose track made within a day or two. A black bear, too, had been prowling along the shore in search of something to eat, and in the mud close beneath the overhanging alders we saw where a shy whitetail deer had for a moment stepped out of his cover and then retreated back into the silent forest. Further along we saw more moose tracks, those of a cow and a calf, and stepping back on a deeply worn but old game trail, found a place where some Indians had built a blind at the foot of a great tree to await the passage of some game. It seems probable that there are some moose here and that they spend the days in the swamps on the mountain side and come down to the lake at night.

Wading the deep, swift stream, which, in one or two places almost threw us off our feet by the force of its rushing waters, we went over to the inlet and began to cast for trout. The east side of the stream is far more convenient to fish than the west. Here there are wide gravel bars and the stream is so narrow that with forty or fifty feet of line out it is easy to reach across it. On the other side the trees and brush are thick and grow close to the bank, so that it is not easy to cast with a long line.

An hour's fishing was had without result. The trout would not rise. All the flies in my book were tried in vain. Then finding a deep hole in which were ten or twelve fish from one to two feet in length, I put a piece of meat on my hook and let it drift down under their very noses, but they paid not the slightest attention to it. It was really very discouraging. Finally I put aside the rod and watched the fish for some time, and at length made up my mind that they feed almost entirely on the young whitefish, which are here so abundant. The appearance of one of these little fish was the signal for a rush on the part of every trout in the neighborhood, and often one of them would make a false start at some object carried down by the stream which bore some resemblance to one of the tiny silvery creatures for which they were lying in wait.

Retracing our steps we killed another widgeon on our way to camp, dined early, and then tried still-fishing for lake trout, and being unsuccessful at this, set a net for whitefish. We had just finished this operation and rowed back to the shore, when we saw a horseman appear over a ridge a mile further down the lake, and could see even at this distance that he was an Indian. Before he had advanced fifty yards toward us he began to ride in circles along the hillside, and Yellowfish called out, "He is drunk," to which I responded, "No, he is signalling." This proved to be the case, for a little later, when the Indian stopped at the camp to talk, he said that he was informing some of his companions, who were in sight but out of hearing, that he had discovered some people. He was a Kootenay, but could talk some Piegan, and told us that eight lodges of his people, under the chief, Keh Kowitz-keyucla, which, as all the world knows, means Back-in-sight, were camped some miles below on the river. They had been out fifty days, and had been quite successful in their hunting, having killed about forty sheep, two bears—one black and one grizzly—one moose, a few elk and plenty of beaver. Their main business was trapping, and they hunted only when meat was required for the camp. In these days he said game was scarce. There were still sheep on the mountains, but they were high up among the rocks, and it was hard to get to them. I asked him when he had killed any buffalo, and he replied that two years ago back [east] of the Sweet Grass Hills he had killed eight. Since then he had not seen one. So chatting about the game and the country, we sat in front of the tent until the sun had set, and then the Kootenay clambered on to his steed and rode away into the shadows.

The first duty of the following morning was the taking up of the net. A fresh breeze was blowing and quite a heavy sea running out in the lake, but after some trouble we managed to get the boat in position and soon had the net and the half a dozen fish it contained on board. There was one lake trout weighing five pounds and five whitefish running from two to two and a half pounds in weight. While we had been at work at the net Yellowfish had been busy getting breakfast, and it only remained to cook a fat whitefish to complete the preparations.

Not long after breakfast four Kootenays rode up to camp and dismounted, and we had a long talk and smoke. They were going hunting, and if there had not been so many of them I think that I should have invited myself to go with them, but being too modest to do that, I concluded to ride down to the end of the lower lake and try to catch some trout in the St. Mary's River and perhaps visit their camp.

Appekunny and I therefore saddled up, and leaving the Indians still smoking in front of the tent, rode off down the lake. The trail leads over a succession of ridges, generally covered with a low growth of aspens, but sometimes bare, and through the ravines by which they are separated flow little streams with brush or cottonwood groves along their banks. Many of these streams have been dammed here and there by the beavers, and on the muddy ponds thus formed ducks collect in windy weather when, as was the case today, it was uncomfortable to be on the lake. On two of these ponds Appekunny made a couple of nice double shots at a pair of mallards and a pair of widgeons, but in each case the mud was so deep that it was impossible to recover the birds, and we resolved that it was useless to attempt to kill ducks where we could not retrieve them.

A more satisfactory kind of shooting soon presented itself. We were riding sleepily along at a walk over a ridge, where the young aspens were only a foot or two high, when suddenly my old horse braced himself, threw up his head and halted, as out from under his feet with a roar like an old cock partridge, started a great dark bird and darted away before the wind, scaled down the hill, and balancing itself this way and that, twisted into a grove of trees. "Blue grouse. Hurry up. There are more here," was the cry, and as the bearer of the shotgun tumbled off his horse and placed shells in his gun, two or three more of the grouse rose and went like bullets after the first one. Then another rose, and before it had gone ten yards turned neatly over and struck the ground with a sound pleasant to the sportsman's ear, and at the sound of the shot two or three more rose and were soon out of sight. Appekunny walked on and I followed with the horses, and a pair of outlying birds which rose at long distance fell before his ready gun. Then, as no more could be started, we rode on, and I was forced, in spite of my remonstrances, to carry the shotgun so as to be prepared for the next brood which we should encounter. This was down by the river just where the trail descends the steep bank to cross to the other side. Here a couple of birds again astonished Jerry by roaring out of the low rose bushes under his very nose, but as the cover was only a few yards away they were safe before I could twist round in the saddle to shoot. After I had dismounted, another got up behind me and made for the river bank, and as he had further to go I was lucky enough to tumble him over at about forty yards. Still another was started, but he was cunning enough to just rise a foot or two and then dip down behind a ridge which covered his retreat until long after he was out of shot. We tried to start the two which had taken to the cover close at hand, and might have got them had we both been armed, but naturally they went out of the brush on the side which was unguarded.

A little below this point there are a number of deep holes in the river, and leaving our horses on top of the bank, we slipped and slid down the steep bluff to the water's edge. The furious gale which swept down the stream made it impossible to cast, but the wind would carry line and leader down over the water, and for an hour we had some very pleasant sport. None of the fish which we took were very large, but they were good fighters, and took the fly with a rush which made the sport interesting.

While we were thus occupied a couple of Kootenays, riding on a single pony, made their appearance on the opposite bank of the river. One of them we recognized as having been at the agency previous to our departure. It was impossible to talk at the distance which separated us, and the conversation was carried on altogether by means of the sign language, which is so universally employed among the Indians of the West. The manner in which long conversations can be carried on between individuals, each of whom is ignorant of the language spoken by the other, always seems very remarkable to one who for the first time sees an interview of this kind, and though long familiar with this method of communication, I myself still feel something of the astonishment that I experienced when I first saw it. The Kootenay asked where his people's camp was, and finding that we were unable to tell him, asked a number of other questions, and we in turn inquired about matters at the agency. Then the two rode off down the river.

A little later we stopped fishing, and climbing up the bank again, reached our horses. As we mounted I looked across the river and saw the two Indians galloping across the wide valley to a point where a narrow stream valley came out from the hills into the wide bottom of the St. Mary's River. I watched them for a few moments, and as they disappeared behind the point of the bluff I heard the vociferous barking of dogs, which told me plainly that the Kootenay camp was there. We rode up the river to the ford, and just before reaching the spot from which we had started the dusky grouse, I dismounted, and walking through the rose bushes put up two of the birds. They flew in opposite directions, and at one of them, a superb old cock, I fired just as he was topping the alders on the river bank, and then turned to give the other my second barrel, but he had got to the cover of the brush. I could not be sure that I had hit the first, but handing the gun to Appekunny I went down to the bank, and there was the grand bird beating his death roll in the shallow water. Meantime my companion had gone after the other bird, and after a little search saw him on the ground dodging about behind a clump of brush. It took some time for him to get a shot at it, for the bird would not fly, and persistently kept the bushes between itself and its pursuer. At length, however, it made a false move in its dodging, which cost it its life.

Hanging our birds and fish in the bushes we crossed the river and rode briskly across the wide level valley toward the Kootenay camp, which we soon reached. The first evidence of its proximity was the horse herd of about one hundred head feeding close to the river bank, and as soon as

had passed these we saw numerous trails leading up the bluff. It was not until we were almost upon them, that we saw the lodges standing in a little opening among the cotton-woods. The camp was clean and the people seemed well to do. We saw no men, but numbers of women and small children peered at us out of the lodge doors. The former seemed to me unusually pretty for Indians. Staked out upon the ground were a number of sheep skins, and one that had covered a small black bear, while a large grizzly skin and a dressed moose hide hung from two of the trees whose branches were festooned with bundles of dried sheep meat. We did not dismount from our horses nor speak to any of the people except to a couple of well grown boys, who told us that there were plenty of fish in the creek. Riding down into the water I set up my rod and in a short time had captured half a dozen of the most vigorous and gamy fish that I had yet seen. I should have fished here longer, but the sun was getting low and it was necessary to start for camp.

On the way back we again rode into the dusky grouse and here Appekunny did some very good, and I some very bad, shooting. The birds flew at a tremendous rate of speed in the high wind, and it required quick shooting to stop them before they were out of range. This blue grouse shooting is splendid sport. The birds are large and strong of wing, and get up with a rush and roar that quite equal that of the ruffed grouse. They are abundant here, and I do not doubt that a man with a brace of good dogs could kill on these ridges from thirty to fifty birds a day.

As we were lounging about camp just at dusk, the four Kootenays who had stopped in the morning, rode up and dismounted. They had been hunting on a mountain to the east of the upper lake, and had killed four sheep, the meat of which now hung from their saddles. The news of their success filled me with rage and envy. It was natural enough that the Kootenays should be successful, for they know these mountains well, and are familiar with all the best localities for game; moreover, they are true mountain Indians, and are as much at home on foot among the rocks as in the saddle on the plains. On the other hand, we were almost entire strangers in the country and had to learn everything for ourselves. Before the Indians left us that evening I made overtures to one of them to come the next day and hunt with us. But, although he promised to do so, I felt no very great confidence that he would carry out his agreement. Yo.

The Sportsman Tourist.

Address all communications to the Forest and Stream Publishing Co.

AMONG THE SEA ISLANDS.

FROM the St. Johns River extending northward the coasts of Florida and Georgia are composed of low-lying islands. Many of them are mere mud banks overgrown with a heavy marsh grass and dotted with numerous small ponds, the abode of great numbers of waterfowl. Often the creeks that intersect the marsh are so small as to be unnavigable for any craft save the smallest of canoes. There are many, however, that are traversed by large steamers and the view obtained by tourists is both grand and desolate. These are the famed Sea Islands, whose planters grew the noted long staple cotton in the palmy days of slavery when cotton was king.

I had passed through these islands several times on a steamer and determined some day to do so in a small boat, for I reasoned there was sport to be had and an entirely new cruising ground to explore. It was not until last November that my opportunity came and then I could only be away ten days, but I determined to do all I could in that time, and accordingly on the afternoon of the 9th I left Mandarin with a friend, in a twenty-foot catboat, provisioned and otherwise equipped for our long desired cruise.

The thirty odd miles on the St. Johns River, between Mandarin and the entrance to the Sisters Creek, I will pass over without delay. We laid in a few indispensables at Jacksonville and a few more at Yellow Bluff, and arrived at our point of departure from the St. Johns at noon of the second day. We sailed boldly in and at once ran on an oyster bank. Now an oyster bank in use as a reef was at that time a novelty to us. I am proud to state that since that cruise we are in possession of more technical points received from them than any other persons living. Candidly I never ran on so many reefs in a cruise in my life as on this one, and all or nearly all of them were of oysters. The tide was falling and it was necessary to get off at once. We were overboard in a jiffy minus our lower garments except shoes, which we retained to guard against the sharp shells. A few energetic heaves and she slid off and we again filled away. We ran aground many times afterward but also avoided it often by a close watch of the current and avoiding sluggish places. We sighted a stranger fishing from a bateau and inquired concerning the general direction of Nassau Sound. He questioned:

"Goin' to Nassau?"

"Yes."

"Ever bin through befo'?"

"No."

"Well, stranger, I don't reckon you'll ever git thar without a pilot. You'll git lost, and hev ter climb yer mast to git yer bearin's, and when you git up you'll see lots of other fellers up their masts, all lost and trying to find their way out. Take my advice, stranger, and git a pilot. I don't mind taking you through myself for a figger."

We declined, hauled our sheet and continued our voyage.

We found many ducks as we passed through the winding creeks, but all very wild and nearly all flying high. Wirt took a long shot at a passing flock of blue-winged teal, but had no luck. Numerous great blue herons rose from the tall grass on either side, and with an indignant squawk flew off to some less disturbed locality. Once a flock of gannet raised hopes of a shot, but they were too wary. Now we regretted, in language emphatic, our mistake in not bringing a canoe as a tender. Our sail was a warning to all of our approach, and often we saw with disgust a flock of ducks get up from where they had been concealed by a bend in the creek, our sail having started them, while they were invisible from the deck. If we had brought a canoe, one of us would have cautiously preceded the sail boat and no doubt picked up many good shots.

We made Cedar Point about sundown and came to anchor for the night. Our arrangements for comfort and convenience were very fair for a small boat. We had a canvas cabin that was removed and stowed under forward during the day, and which, when in position at night, effectually protected us from dew or rain. We had a mattress which fitted around the centerboard, also an oil stove, which was a necessity in a cruise where we were compelled to camp aboard almost entirely.

The next morning about 8 o'clock we made Fort George inlet, and the tide being strong ebb, we had a long and tedious beat up the reach. We often tacked without gaining ten feet. About noon we came to the "canal," so called because it is a channel dredged out for the Savannah steamers, and is, at low water, not over forty feet wide. Wirt started a flock of ducks by going ashore and plowing through the mud. However, he didn't get a shot, and returned to the boat plastered with mud till it made him tired to carry it and me to see him.

Just as we passed out of the "canal" a strong breeze from the N.E. sprang up, and at the same time we spied a flock of curlew and willet on a mud bank ahead. As we neared them they rose, but one curlew flew near the boat and we secured him. A little further on I saw a yellowleg on a mud flat and ran close to him. Wirt broke his wing, and at the same time the boat stuck fast on the flat. Rather than waste another shot on the snipe I volunteered to go after him. I stripped and waded ashore, and the moment I got out of the water I went into the mud nearly to my waist. Although the yellowleg could not fly he could run, and it was an invigorating spectacle to watch the pursuit. I had a similar experience before, which although not cheerful to recall, I think I will relate, because to an observer it must have been more entertaining than "the greatest show on earth."

We were sailing in a narrow bayou similar to the one spoken of above, Dizzy and I. Dizzy is an Englishman, but in spite of that misfortune is a rare good fellow and without a superior on a cruise. We rounded a point and discovered a rosy spoonbill quietly feeding about one hundred yards to the left. We immediately ran the boat close to shore, and I hastily divested myself of my clothes and, taking a gun, slid overboard and waded ashore. I expected to find mud, and I found it. If there is a muddier spot in the world I'd like to see it—from a distance—out of pure curiosity. I floundered on till finally I fairly stuck fast, in to my waist. Dizzy, in the boat, occupied his time by alternately giving preposterous advice and rolling on the deck in fits of laughter. I wiggled and squirmed till nearly exhausted, and then stood still to rest. I would have liked to sit down, but I couldn't bend my legs. When I attempted to pull one leg out, the other, having all my weight, sank deeper than ever, besides there were a lot of sharp oyster shells in the mud that cut me whenever I made a move. My gun was a nuisance; I could not lay it down in the mud, so I held it aloft and thus lost the use of one hand, while its weight aided to keep me down. I might have been there yet if it had not occurred to me to lie over on my back, and in this way I finally got out, and partly rolling and partly sliding I regained the water. I didn't get the spoonbill.

But to return to the yellowleg. I caught him at last, after falling down several times, which did not improve my personal appearance. I had a cut on one foot from an oyster shell that made me limp for a fortnight. Next time I won't be so stingy with my shells.

The breeze increased till we had all we could attend to, and when we could start our sheets we fairly flew. We soon ran into Nassau Sound, and running across to Amelia Island, we landed on a shell bank to cook dinner. We replenished our supply of water from an old darky's well. The house near by we found belonged to Jim Long. We had dinner ashore, principally broiled snipe. The curlew and yellowleg were fine, but the willet were decidedly fishy. After a smoke we interviewed the Long family. Old man Jim, his wife told us, had "dun gone to Fernandina to trade." As he had taken all the eggs with him, nest eggs as well, we were unable to buy any and we parted.

The wind was dead ahead but the tide was flood and we made good progress. Just before dark we made the head of the sound and anchored under the lee of a bluff, on which we observed several houses. We put up the cabin and produced the remnant of a ham worn to the bone. Coffee, biscuits and jam assisted the ham, and our digestion needed no assistance. Our usual custom was, after putting everything in order, to lie at length and read and smoke until bed time. That night Wirt had nothing to read, and after smoking for some time in silence he suddenly jumped up, thereby upsetting the recently washed dishes which were balanced on the centerboard, and proposed a game of chess.

"How the blazes are you going to play chess without board or chessmen?"

"Play it in your head, of course."

"Yes, certainly, play it in my head, but how about yours?"

"Well, I guess I've got nerve enough to risk it."

"Well, I decline. I've tried it once, and speaking plainly, it wasn't a success. I'll tell you about it."

"Do you remember when Dizzy and I were running the Ever Blue on the river? Well, one night we were coming up with a big freight, and after supper, as we had nothing to do, Dizzy proposed a game of chess. Now, neither of us were experts; but we thought we knew enough to get along, so we started. The first few moves were easy enough, and as soon as I got a chance I ran my queen out and stationed her where she would rake his king if he moved a pawn which stood between them. I was very careful to place her out of danger, and you can imagine my astonishment and indignation when Dizzy announced as his next move, 'Pawn takes your queen.' A dead silence. Presently I inquired sarcastically, 'Pawn take anything else besides the queen?' 'No, only the queen.' 'Had that pawn been moved before?' 'No.' 'Then, how the nation did it take my queen, which was at rook's fourth?' 'It's plain you don't understand chess.' 'Not that kind, certainly.' 'If I had a board I'd show you just how you lost your queen.' 'You might try, but there wouldn't be any money in it.' Just then we came near running down a steamboat, and after it had passed chess was not referred to and we smoked in silence."

Wirt did not press the game of chess, and presently we heard a hail from a boat that was approaching. It came alongside, and two gentlemen invited us to come ashore and spend the evening at their house. We accepted, and "biled up" as much as our wardrobe admitted and they pulled us ashore, where we met several gentlemen and ladies with whom we spent a very pleasant evening. We returned on board about 11 o'clock and at once turned in.

We passed the drawbridge of the "Transit" Railroad early next morning, and at once struck a very heavy sea breeze. First one and then two reefs were put in, and we made Fernandina about 11 o'clock, with everything piled to windward and the lee rail under. At Fernandina we decided to wait for the wind to lull before crossing Cumberland Sound. So Wirt remained to watch the boat while I went up into town and purchased some supplies and some newspapers. About 2 P. M., the wind having fallen to a gentle breeze, we got under way and beat down to the sound, whence we laid our course for Dungeness, our destination.

Cumberland Sound is a beautiful piece of water about four miles long by one and a half in width. Protected from the sea by the southern end of Cumberland Island, it affords a secure and commodious harbor for Fernandina. We anchored off the old plantation of Dungeness about 5 o'clock, and decided not to go ashore that night; but early next morning we hauled in to the wharf, and all the forenoon we wandered over the splendid domain. Dungeness, once the residence and now the last resting-place of Gen. Nathaniel Green, commander-in-chief for a period of the Revolutionary army, is a magnificent plantation. It occupies the southern end of Cumberland Island, and as regards health is probably as near perfection as any spot on earth. The plantation is aisled in every direction with grand old live oak avenues, to which even Bonaventure is not superior. The sea on the east and the sound on the west meet at Fernandina bar and form the island. Recently I learn the New York Yacht Club propose making it their winter headquarters. The choice is a good one. The sound forms a beautiful harbor. The bar is a good one, and it is easily accessible from New York. The quaint little burial plot, where are the graves of Gen. Green and "Light Horse" Harry Lee, are worth a long journey to visit. A more beautiful spot it would be hard to find. The inscription on the stone at the grave of Gen. Lee is brief and simple:

SACRED TO THE MEMORY OF
GEN. HENRY LEE, OF VIRGINIA.
PROBUS OBIT.

Mr. Carnegie has built a large and beautiful mansion on the site of the old structure. The original edifice was square and massive, built of coquina. On a former visit, before the construction of the walls, I counted sixteen rooms, estimated to be 20x40, besides servants' quarters, a fine old mansion and conducted in princely style.

We had a bath in the sea and saw many willet on the shore, but it being Sunday we carried no guns with us. We left Dungeness about noon and drifted to Fernandina and there caught the young flood and drifted to our anchorage for the night, some three or four miles further on.

About 10 o'clock the following morning, still drifting, we passed the residence of the gentleman who had entertained us a few nights previous, and many friendly tokens fluttered on the bluff and were vigorously answered with the rather grimy handkerchiefs of the crew.

At Nassau Sound that evening, through not having any wind we got into an awkward scrape. We were approaching the mouth of Nassau River—the exit from the sound—and were drifting with the ebb. On attempting to enter the river we could not stem the tide, so we worked over to shallow water and both jumped overboard and attempted towing, but the short seas broke so spitefully against the boat we could do but little. Very soon the boat struck on a hard sand bottom and every sea lifted her and pounded her on it again and again. It began to look serious. How long she could stand that sort of thing without opening was uncertain, but not long we felt sure. The sun was setting and we were chilled and numbed by our long towing operations. It would never do to spend the night there. We could not get afloat in deep water, for there was no wind, and the seas breaking against her prevented our attemps to shove off.

Finally just as the sun set a light air came over the marshes and while I kept her head to the seas Wirt climbed on board and got sail on her and she slowly began to make headway. The breeze increased and her pounding grew less and less as we neared deep water, and when she ceased to touch I climbed on board and wrapped a blanket about me, my teeth chattering with cold. We did not attempt to find the channel for the river, it was too dark, but ran about a mile up the source and found a quiet anchorage for the night. Neither of us will easily forget how comfortable a cup of hot coffee made us that night nor the luxury of a pipe afterward. When we tried that exit next morning it was with plenty of wind and some points from Jim Long concerning the shoals.

By this time we realized that as far as shooting was concerned we were not to be surfeited this trip. Ducks then were in plenty but very wild. Curlew and other snipe we met but scattering and the result of numerous long shots was not satisfactory.

We were drifting with the tide one morning—in fact the return trip was nearly all tide work—when we saw, about one hundred yards ahead, two otters playing in the water at the mouth of a small creek. Their skill in the water interested us greatly. They allowed us to get within fifty yards of them, then they dove and we saw them no more.

We made the St. John's River that day at noon, and beacon 17, five miles below Jacksonville, that night. From Yellow Bluff to St. John's mill we had a wholesail breeze and held her to it. Next morning we stopped at Jacksonville and put in a short time at a restaurant, then we hoisted sail for the last time and at four P. M. we came to anchor at Mandarin.

Before I finish let me say if any one wants to cruise through the Sea Islands let him take a catboat of very light draught, and a canoe as small as he can shoot out of, and I advise the summer months as much more suitable for enjoyment. The days are longer and the water is perfect for bathing, and there are a considerable number of snipe in August and very fine fishing. CALUMET.

MANDARIN, Fla.

SALEM, Mass., Dec. 28.—A pileated woodpecker was shot last week at Manchester, Mass. This is a rare Essex county bird. There are some golden eye ducks, mergansers and saddle-back gulls, with an occasional snow owl seen. Some quail and partridges yet left.—X. Y. Z.

CAMP FLOTSAM.

XVII. — UNDER TWO FLAGS.

FOR two days and nights we sat housed by the great stoves watching the pipe go round and listening to tales of native sport. Although it was midsummer the fire was a luxury. The cold rain poured steadily from the northeast and men and dogs sought shelter within doors and warmth about the genial hearth. But the next day dawned warm and clear, so we lowered our tents and box of hardware from the loft where they had been stored, and, with the aid of Sabattis, soon had them in the boats at the landing. Before night the canvas was pitched once more under the pines. Whether our camp here should be permanent we were undecided, nevertheless the bedsteads were built and the sleeping arrangements perfected, and the cooking range put in shape for use. A few of the stones in the latter had fallen from their places during the winter, these were reset and the apertures filled with wet clay. The top of the cooking stove was found upon the rock where we had left it on breaking camp last year, and our kitchen was soon complete. Just as we were congratulating ourselves that our camp building was ended, we found that the bundle of blankets and our larder had been left behind. So, after tying up the tents and seeing everything safe, we abandoned camp for the night. It was well that we did, for before we reached the shore a cold wind was blowing up the lake and we were threatened with another storm. It came, but found us snugly fixed by the fire. As darkness came on and we sat listening to the roar on the outside we did not regret our failure in getting settled. We were not afraid of a storm but there was a certain witchery in huddling around the stove and watching the gleams light up the dark corners of the room through the cracks, listening meanwhile to strange stories from the lips of strange men, besides we had enough time at our disposal to vary our experiences as we listed. Our camp was ready for us and we had only to step in and begin its life and were content.

That night the royal mail brought me the FOREST AND STREAM containing an addenda to "Woodcraft," in which, in fit keeping with our camp building of the day, "Nessmuk" paid out on us as follows: "The half hotel, half picnic style of outing most in favor with 'Wawayanda' is no doubt a pleasant way of passing a portion of the heated term. It is amiable in *pater familias* to take his wife and little ones to a green, well-shaded island and give them the benefit of an out-o'-door life for a few days or weeks. In which case a wall tent with flaps and a two-horse wagonload of duffle will be none too much."

We beg to inform the father of the craft, before whom we all are but as dust, that there is as wide a difference between our camps and "the half hotel, half picnic style," as there is between the latter and his own. True, we are advocates of soap and the bath; we do not make our outings occasions in which to test the question as to how long a shirt can be worn without change, and here perhaps the dissimilarity ceases. We can carry our duffle in a single skiff, and no *pater familias* loafs around our camp. That "it requires less labor to outstay a rattler that has taken up quarters in one's bed than to build a bedstead," may be true as a matter of fact; perhaps laziness, like wisdom, is justified of her children when one is in the woods; but why any one should prefer an open brush shanty for a two-months' outing when a tent that will close is obtainable, is something which, in the words of the rider of the Bucktail, we shall never understand. Our query as to how "Nessmuk" managed it with his shanty tent "during a week of storm, when keeping up a fire out of doors," is answered by, "Drive four crotches, lay two cross poles theron, then lay strips of bark or slabs over the fire in such a way as to lead most of the water back of the fire." In other words, build an extra shanty over the fire; if the storm is a driving one, weave in some boughs; if the wind threatens to unroof your kitchen, put on a few slabs; and when it finally falls, repeat a *nunc damit* or two and retire to your other shanty. If you like this better than "a sheet iron contrivance" which weighs three or four pounds, and can be cooked on in wet weather and can be set in or out of the tent as occasion demands, have your sweet will. And it is possible that there may be more enjoyment in going on all fours about a shanty than in having head room in a tent, and that "Woodcraft" was not intended as a guide to "smoothing it," but to roughing it. If so, our criticisms were uncalled for; but we take it that the average outer is bent on living as comfortably as the small, light style of cuting will permit, and that the possibilities are somewhat greater than "Nessmuk" would make them, we appeal to the grand army.

The next day saw us in camp to stay, come what might of cold or storm. Blankets were unpacked, rods unstrapped and jointed, a rough dining table was built in the shade near the range and we were settled. Before midnight another storm was upon us and the rain beat heavily upon the tents until midday. The "sheet iron contrivance" was set in the tent and upon it fried pork, sliced potatoes, coffee and camp bread were soon made ready for breakfast. Then while the rain was still falling we started to break the ice and take the first bass of the season. By the time we were well under way, the rain had ceased, but the lowering clouds hung low over the water. We had taken a hand-made, seven ounce lancewood rod which had done heroic work in its time for the opening, and with a scarlet ibis and Canada fly we made our first cast just around the rocky point which jutted out below the camp. By the time we had reached the island above, six small-mouths of not over a pound each had been landed. At the head of the island we turned to the left and ran over a long shoal which stretched toward the south for four or five hundred feet where we took in two pike of about three pounds a piece. Bravely we moved on, unconscious of the doom awaiting us at the deep water in front. As we reached it there was a dash for the white Canada, a strike, and a doubling of the rod which broke just above the grasp and fell overboard. We had it again in a second, but the fight at the end of the line did not seem to be all that the strike had promised. With a muttered doubt we begin to pull in the slack, the game was gone, no, we felt it again and there was a grand rush for liberty, which weakened suddenly and the prize showed itself alongside. It was a finely fashioned goggle eye of six or eight ounces in weight. Meditatively we reeled up the line and laid the unjointed rod in the bottom of the boat.

There have been occasions where the hour and man have met, and times in which they have failed to connect by a reduced majority; in this latter period our lot seemed to have fallen. But on reflection that many an ardent soul has found pleasure in hunting without a gun, why should we not angle without a rod, line or hook. We turned back and ran over the shoal and then over the greater one off Knapp's Point, rounded Lost Spring Island, and started to make camp by circumnavigating our own island. Midway of the lake bass were leaping over a shoal safe from any lure of ours. Rounding a point, we surprised a crane that was engaged, though with perhaps better success, in the same occupation as ourselves, and which, upon seeing us, fled over the tree tops out of sight. Soon the sun came out warm and bright, the sky cleared, and when we ran into the little bay in front of the tents a shimmer of heat was on the hillside, and we were glad to lay aside our rubber clothing and coat. When dinner was over there was still time to take a run down to the outlet, and we made it in the waning of the afternoon, which was witnessing on the hillside above the fast flitting moments of the life of the young driver Stoness. His house, which stood close by the landing, was deserted and silent, the family had been summoned in haste, that his eyes might rest upon them for once before taking his wingless flight. When we returned to the boat it was dark, and they told us that he was dead. The wail of a young girl was ringing out on the night in a sorrow that refused to be comforted. A kind neighbor or two was bringing the dead man to his home, where, stopping for a moment, we learned that he had been mortally injured by the careless firing of a blast. We could bring nothing of comfort to the afflicted, so we shoved off the boat and slowly moved out of the shadow into the dim starlight upon the lake. We sat long in the open door of the tent, thinking of the silent form lying cold and pale a couple of miles away, with the cry of the girl in her first great grief still ringing in our ears, and we wondered whether, after all, it was not better with the dead than with those he had left behind.

With the warm weather came the mosquitoes to make night hideous, and, on the first night, with the tent flaps open, they came in swarms and filled every corner. A smudge at the door on the windward end checked them somewhat, but as the night wore on and the smudge burned itself out, there was a carnival within which would let no one sleep. We had brought a box of "a preventive," so the label read, "of the bites of mosquitoes, gnats and black flies, something which would not injure the most delicate skin." It might, with perfect safety, have been warranted not to injure or be offensive to the most delicate mosquito, for the celerity with which a well-trained and experienced one would scrape off a spot which seemed promising and sink a shaft was something wonderful. Fortunately, we had in our kit a bottle of the oil of pennyroyal, and we set to work to compound a preventive of our own. Taking nearly equal parts of this and vaseline, we had a mixture which was clean, would not evaporate and was a complete safeguard against bites. During our outing, through nights of which we slept on the banks of mosquito-haunted inlets and streams without a tent or netting, a slight application to the exposed parts of the person insured us peace. No outer should go into the woods without it.

Through the greater part of the day and night following the rain was rattling upon the tents, with an occasional burst of thunder and lightning. About noon on the day after, it cleared again, and we made our way once more to the outlet, this time to attend the funeral of Stoness. A group of fifteen or twenty were gathered in the small two roomed house, or sitting upon the logs in front. After an hour of waiting, the coffin was brought from the house, and without a pall or other covering was placed in an open wagon, which all followed to the church, where the services and burial were to take place.

It was dark before we pushed off again for camp. We were met at the water's edge by the enemy and our return was a track of blood. The new repellant was in camp, and we fought and slapped our way through the black cloud that hung over the water and enveloped us in a circle of weird music. We charged through the hosts awaiting us at the landing and took refuge in the tents, brought out the smudge pail, which was soon pouring out its incense, while we applied the vaseline and pennyroyal, which soon brought us peace. The hum went on around us, within and without, but we slept undisturbed through it all.

The early morning revealed to our astonished sight one of the chief episodes of our camp. On the island in front, half a mile away, two tents were glimmering through the trees, and a slender column of smoke marked the presence of some seeker after solitude. The presence of a camp, other than our own, upon the lake was a novel sight, and we were in a state of wonderment as to whose and whence it was, and what had prompted its location on this backwoods lake.

However much one may desire solitude, however great the distance which he puts between himself and civilization to secure it, let the hermitical impulse be never so strong within him, his heart will yet yearn for the human and his brain seek the mysterious fellowship of its kind.

The first day, nay the first hour, put us on a footing of firm friendship with our neighbors which flourished through the bright summer days, will survive the chill of winter, and, we fondly hope, will be renewed where next our camp fire burns. The new camp consisted of two veteran anglers and sportsmen, both retired officers of Her Majesty's service. Every trout and salmon stream of note, from the Nepigon to the tributaries of the lower St. Lawrence, had yielded tribute to the Colonel's skill, while the Captain was an expert among the bass, trained to their capture in waters to which they were native. Added to this, he possessed the taste and skill of the artist and his sketch book was adorned with scenes from along the Mediterranean, made in the days when he and the Colonel went a soldiering, and while the memories of Inkerman, Balaklava and Sebastopol were yet living facts to them. Before us hangs a water color of a lonely camp upon a bluff, under the pines, with a stretch of waves in front which are tinged with the glow of the sunset in the sky—a beautiful memorial from the generous captain of our summer home. Many were the evenings which we passed in high discourse over our pipes until midnight was in the sky and the dip of the oars, dying away upon the lake, was the good-night of our returning visitors. And what had brought them to this spot, above all others, in a land set thick with lakes and furnishing the best fishing on the continent? A file of FOREST AND STREAM containing "Camp Flotsam" of last year had been read through the winter and was brought into camp by them to be re-read on the spot, a task which, we venture to assert, was never commenced. However, it may be, it was in this way that it came about that we had neighbors, and that, while the world was rife with rumors that the crescent and the cross were soon again to dash against each other and old civilizations contend with younger born, while the northwest war cloud was still burning out its passions, there on the lonely Canadian lake a spirit of peace was hovering and the cross of England and the banner of the stars waved greetings and farewell across the bay at dawn and dusk, and the Captain's taloo and our response were the daily assurance to each of "all's well."

WAWAYANDA.

SPORTSMAN AND POET.

THE following autobiographical notes, furnished by Mr. Isaac McLellan, are very timely just now, as Mr. McLellan's fourth volume of poems is in press. Very many of our readers will be pleased to have this information about one with whose name they have been so long familiar:

As I have been requested by you to furnish a sketch of my past life, I think I cannot do better than by recalling to mind the names of a few of the distinguished persons with whom, in greater or less degree, I have been associated in early friendships, or in the delights of field sports. Your request is probably prompted to learn a little of my past history as the author of a book on "Rod and Gun, or Sports by Flood and Field," now in press and soon to be issued by Henry Thorpe, of 98 Nassau street, New York.

Prominent in my memory are the names of such true lovers of sport as Daniel Webster, Frank Forester, Genio C. Scott, Wm. P. Porter, Carl Benson, Charles Hallock, S. C. Clarke (my good cousin), Caleb Loring and many others, nearly all of them at rest in the land of silence. In a cottage near the mansion of the former of these men, I passed nearly three years, at Marshfield, Mass., being introduced to that sportsman's home by the illustrious statesman himself. It was then that with plain Nat Delano I sojourned, he being Mr. Webster's favorite boatman and boatbuilder. Mr. Webster in previous years had been an enthusiastic snipe and duck shooter, but increasing bulk and years had forced him to lay aside the gun, and his great solace was in fishing, which was a first-class sport along the sea shores. Mr. W. took no part whatever in the management of his little sloop, saying that he "was a perfect dunce in a boat," but he could safely rely on the skill of Nat Delano. Mr. W. could skillfully steer the ship of State at Washington, but in a heavy storm off Brant Rock and Green River we should much prefer to trust the boat tiller to the management of honest Nat.

I love also to recall the names of other friends and acquaintances as those of N. P. Willis, Holmes, Percival, Benjamin, Sargent and others, and such college associates as Longfellow, Hawthorne, G. B. Cheever, Franklin Pierce, Wm. Pitt Fessenden, John P. Hale, J. S. C. Abbot; Calvin E. Stone, and last but not least, the late Hon. Sargeant S. Prentiss, of Southern celebrity. None of these men, with the exception of the last mentioned, found any charm in the sports with rod and gun. We have roamed, in the bygone years, for hours with Willis among the pine woods of Andover (where we were room mates and members of Phillips Academy), or mooned away the afternoon by the banks of the lonely Shawshene; and I have also loitered through the woods and by the shores of Androscoggin, at Brunswick, Maine, when neither of these two poets would bestow a glance on the flight of the wild pigeons or the sudden splash of the river-fishes with the pleased look of the gunner or angler.

With Willis my intimacy began in childhood and continued to the close of his life. After our graduation at different colleges, and when I had put up my lawyer's shingle in Boston (I being at the same time sub-editor of the *Daily Patriot* and also of the *Evening Gazette*) it was his wont daily to drop into my office, or failing that, it was my custom to visit him in his little room at his father's house, the sanctum where he conducted his monthly magazine.

Our friendship with Longfellow began in college days and continued to the last. We exchanged, during the many years, frequent letters, and I much regret that I have parted with all of them to autograph collectors, yet I can give a brief extract from one written some years since to me by him: "I see you in imagination, tramping with your gun and dogs over the frozen marshes, eager for any birds that have not been wise enough to migrate southward at this season (Feb. 6, 1875). 'Straight a short thunder breaks the frozen sky,' and the beautiful creatures fall and 'leave their little lives in the air,' meanwhile I sit here by my fire, busy with the reading and making of books; not so healthy a recreation as yours, perhaps, but more congenial to my taste. My old enemy neuralgia sometimes troubles me and then I suffer like Laocoön with his serpents."

A few years after we had graduated, Longfellow, then a professor of Bowdoin College, came to pass a part of his winter vacation with me at my father's house in Boston, and it was our custom, late at night, to retire to our room and there while away the time in chat over college days and in pleasant enjoyment of our cigars at the fireside. At such times he produced from his valise the original MSS. of his "Outre Mer," which he read aloud to me; so that I was the first person to make the acquaintance of his first book. I was greatly delighted with it, and the next day sought to dispose of it to publishers, but all in vain, for they knew not the name of Longfellow. He then went to New York, and on his return informed me that he had disposed of the work to a leading publishing house there.

I was born in the good city of Portland, Me., at about the same time that Longfellow first saw the light. In a few years my father removed to Boston, and at an early age I was sent to Phillips Academy, Andover, Mass., and in due time to Bowdoin College, Brunswick, Me. I had the honor, when receiving my first and second degrees, of pronouncing the class poems, and later delivered one before the Society of the Phi Beta Kappa.

At about the latter period I published with the eminent houses of Allen & Ticknor and Ticknor & Fields, three volumes of poems and one of foreign travel, which latter I compiled from the letters and manuscripts of a deceased brother, who had traveled in Europe. I then made a visit to Europe myself, and passed nearly two years there, and in Egypt and Palestine, and on my return published in a daily Boston paper a long series of letters descriptive of my travels. On my return home, my tastes were decidedly of a rural turn, and so I tried my hand at farming for a couple of years, and then abandoned such hard labor forever. I much preferred the gun and rod to the plow and hoe, and from that time to this, a period of forty years, I have devoted myself exclusively to the sports of flood and field.

Being a forlorn bachelor with no ties of wife and child to fasten me to one particular spot, I have wandered at will, up and down the land, from forest to prairie, from river to ocean, in full fruition of a sportsman's paradise. Day after day, month after month, year after year, I have proceeded against the bay snipe and the sea fowl, at every good shooting point and bay of the coast, from Scarboro River, in Maine, to Currituck Sound, of Carolina. I have been out in open boat, in the line of the sea fowl shooters at all the rocky points of Massachusetts Bay; have hid in ambush for bay snipe and duck along the mud flats and salt marshes of Shinnecock Bay; have shot from my little sneakbox at the hovering widgeon, teal, black duck, mallard, brant and geese in Barnegat Bay; have had prime sport among the ducks and broadbills of Currituck; have rioted in pickerel

at the sun
we vital spo
streams to red-head shooting at Chatauqua Lake; and have
sa jects of i
in the great prairies of Illinois, and by the banks of
s large and Rock rivers have loaded my game bag with the
boils to quail and grouse.

Then at my little bowers I resumed work with the poetic pen, which I had begun to use with Longfellow, at Bowdoin, in contributing to Mr. Bryant's *United States Literary Gazette*. This work of imagination was continued in the hours of rest from the toils of the chase; and so I then devoted myself almost exclusively to descriptions of sport, seeking to transfer to paper the scenes in which I moved, and describing the habits and habitat of the game and fish of forest and waters. Being an ardent admirer of natural scenery and of natural history, I sought to photograph in verse these creatures of nature, and so prepare a volume that I might humbly call a work of natural history.

The fowl shooter sailing over breezy bay or rushing river, the grouse shooter ranging grassy prairies, the quail and partridge shooter tramping over stubble field or penetrating the densest thickets, the angler dropping his line in the brawling brook or casting his flies in pond or river, or seeking in the salt sea tides the schools of bass and bluefish, have all rare opportunities to study the habits and varieties of game and fish, and to become not only sportsmen, but poets and naturalists.

It has been for years our custom to construct a little shanty or bower by the banks of some river or bay, and there enjoy the quiet bliss of the hour and the place. When not watching the waters or the woods, it has been our wont to enjoy our book, or the daily or weekly sportsman's journal, varied with an occasional shot from our revolver at the target, or the fragrant solace of the pipe. At such time and place many of the rod and gun poems which have so often for years appeared, were composed. They were originally written in pencil on blank sheet of a book or on margin of the perused paper, and afterward transferred in ink to letter paper on return to the house. All these were written for my own amusement, without thought of fee or recompense, and if they have contributed anything of pleasure to brother anglers and shooters, then the writer has gained his "exceeding great reward." And now that he has collected in one family group these fugitive children of his imagination, so that they may rest together under the paternal roof of the volume now being erected by those expert builders, Messrs. Thorpe and Green, he hopes that they may be graciously received and kindly welcomed by his beloved brethren of the rod and gun.

ARIZONA QUAIL NOTES.

Editor Forest and Stream:

Commencing with the 26th of September, in company with my friend, Mr. Heil Hale, I put in a few days collecting in the foothills of the Barboquivari Mountains, one of the boldest and most noted ranges in Southern Arizona. Its highest point is the Barboquivari Peak, a prominent landmark for nearly one hundred miles. With the northern end I was quite familiar, and had in years gone by prospected along the western slope, but never before had I followed down the base of the eastern side.

We entered the Altar Valley at a point about twenty-eight miles southwest of Tucson, followed the valley southward fifteen miles, then turned westward toward the peak, which, over a smooth grass-covered mesa was here distant twenty odd miles. By noon on the 27th we were camped under the shadow of the great rock.

This trip was one that I had long contemplated taking, and while I purposed to collect generally, the newly made known Bob White was the object of my search. It is of this bird, because of its newness, I purpose to make special mention. New to science and to bird men as a whole, but to every old time resident of Southern Arizona it has long been known and recognized as belonging to the fauna of the country.

The first public attention called to this bird was an incidental mention made by me of it in the Arizona *Citizen*, nearly two years since. This was copied in FOREST AND STREAM, and called forth a contradiction by Mr. Ridgwayof the Smithsonian Institution, who denied the existence of an *Ortyx virginianus* in Arizona. This was a surprise to many people here, inasmuch as they, like myself, had till then believed the bird known. On receiving a letter of inquiry from Mr. Grinnell, I forwarded to him such material as was then at my command, an almost perfect skin of a female and portions of wing, breast and tail of a male. These were submitted to Mr. Ridgway and he pronounced them undoubtedly "*Ortyx graysoni*." On this showing Mr. Grinnell, in FOREST AND STREAM of April 24, 1884, announced *Ortyx graysoni* "a quail new to the United States fauna." He at the same time on information furnished by myself, gave the range of the bird in Arizona. "In the country lying between the Barboquivari range in Arizona and the Gulf coast in Sonora, and more especially between the Barboquivari and the Piumosa, this species is quite abundant. They are to be found on the Sonoite, about sixty miles south of Tucson and perhaps thirty miles north of the Sonora line. From the Sonoite valley they can be found to the west for full one hundred miles and through a strip of country not less than thirty miles in width within the territory. Very possibly they may go beyond that both to the eastward and westward." He further said, "The habits of the *Ortyx graysoni*, so far as we know them, appear to resemble very closely those of the common quail, only slightly modified by the conditions of their environments. They utter the characteristic call, 'Bob White,' with bold full notes, and perch on rocks and bushes when calling. They do not appear to be at all a mountain bird, but live on the mesa, in the valleys, and possibly in the foothills."

This account, I am happy to say, has been fully confirmed by patient inquiry and personal investigation. At this point, so far as the public were concerned, the matter rested till August, 1884, when Mr. Frank Stephens, of San Bernardino, California, at that time collecting in Arizona and Sonora, secured a male bird near Lasabe, in the latter State. This skin he loaned to Mr. Brewster, of Cambridge, Mass., who, in April, 1885, in the *Auk*, pronounced it a new bird and named it *Colinus ridgwayi*, in honor of Mr. Ridgway, by whom it was, thirteen months previously, said to be *Ortyx graysoni*, and as such it was accepted by bird men without question. I showed a pair of skins, male and female, to Mr. E. W. Nelson, when he was here during the early part of the summer of 1884. The same pair were also seen by Mr. H. W. Henshaw when in Tucson at the beginning of the present year. Neither of them doubted the proper identification of the bird, nor was it doubted by Mr. W. E. D. Scott, who likewise examined them, so reliant were they on Mr. Ridgway's opinion. Mr. Stephens saw them on his return from Sonora, and recognizing in them the same bird as his own, believed that he, too, had taken an *Ortyx graysoni*. Later on he loaned the skin with the stated result.

The "hooded quail" (*Colinus ridgwayi*) was, three years since, abundant in the neighborhood of Bolle's Well, a stage station on the Quijotoa road, near the northern end of the Barboquivari range, 29 miles southwest of Tucson and about 40 miles north of the Mexican boundary line. As the station was then comparatively new, the grass thereabouts was high and these quail could be had for the taking; but now that stock has eaten away the grass, the birds have not, for a year or more, been seen about the place.

On the road from Bolle's Well west to the Coyote range (about 25 miles), these quail were frequently to be met with, but teamsters and travelers have killed or frightened them off. One of the former assured me that he had killed as many as five at one shot. Ten miles south of Bolle's, in the Altar Valley, we came across a small covey—there were, perhaps, a dozen in all. The bright, deep chestnut breast plumage of the males looked red in the sun, and gave the birds a most magnificent appearance. We secured but one, a male, the rest secreting themselves in the tall sacaton grass, which at this point was between four and five feet high, and as we had no dog we did not follow them in. Our next place to find them was on the mesa southeast of the Peak, where we camped to hunt for them, but they were scarce, and we managed to secure but few. I will venture to say that when frightened and scattered they are a hard bird to get. Hear one call, locate it as you may, see one fly and mark it down, and without a dog it is virtually impossible to flush it.

In addition to their "Bob White" they have second call of *hoo-we*, articulated and as clean cut as their Bob White. This call of *hoo-we* they use when scattered, and more especially do they use it when separated toward nightfall. At this hour I noted that, although they occasionally called "Bob White" they never repeated the first syllable, as in the day time they now and then attempted to do. In body they are plumpness itself. In this respect, considering size, they overmatch the Arizona quail (*L. gambeli*) with which I compared them. In actual size of body, however, the latter is the larger. Its plumed head, fine appearance and true gaminess of character are advantages in its favor that will ever make it a favorite with sportsmen.

The base of the Barboquivari range is at intervals broken into immense canyons, which lie at right angles with the main body of of the mountain, and stretch far to the plains below. For a mile or more after leaving the base proper they are filled with an almost impenetrable growth of underbrush, weeds and grass. Lower down, however, they flatten out and largely lose their canyon characteristics, but seldom sufficiently so to be the feeding ground of *Colinus ridgwayi*. To determine this point we worked these canyons for two consecutive days in vain, inasmuch as we failed to see or hear one, other than those on the intervening mesas. Arizona quail (*Lophortyx gambeli*), on the other hand, seem partial to a rough country, where such country is possible with them. In the canyons they swarmed by thousands. In this respect I think them peculiar. On our way out we found them plentiful in the rough passes of the Tucson Mountains, but on the plains beyond and in the Altar Valley they disappeared and gave place to the scaled or blue quail (*Callipepla squamata*). These were likewise plentiful, but they too disappeared almost with the first rise in the mesa. In the canyons, twenty miles above here, we, as elsewhere stated, again met with the Gambels, but we found none of the scaled quail until we again returned to the valley. Between the feeding grounds of these two birds I never saw a line more clearly drawn. In this respect they differ from the *ridgwayi*, which were found both in the valley and on the mesa.

Another noticeable feature was the difference in plumage, which was most marked. The Bob White and scaled quail were yet in moult to a degree that rendered it difficult to make good skins, while the Arizona quail were in full plumage. An explanation of this I would like to see from some one more familiar with bird life than myself. I found some difference in the food of the different species. I examined the stomachs of probably a dozen birds, among which were three Bob Whites. No. 1 contained a species of mustard seed, a few chapparal berries, and some six or eight bugs and beetles, ranging in length from a half inch down to the size of a pin-head. No. 2 was similarly provided, but had in lieu of the mustard seed a grasshopper fully an inch in length. These two were taken on the mesa. No. 3 was taken in the valley, and contained about twenty medium-sized red ants, several crescent-shaped seeds, and a large number of small fleshy green leaves. The stomachs of the Arizona quail were filled pretty much alike, all that I examined having been taken from the same feeding ground. Hackberries and crescent-shaped seeds made up almost the sum total of their living. In one only did I find much insect life, and it appeared to have struck a bonanza of little bugs. I opened the stomach of but one scaled quail. It contained seeds and about a dozen bright red cactus berries. Later on I will more thoroughly examine into this matter of food.

The breeding season of the scaled quail must be more prolonged than either of the others, for I saw one brood of probably twenty that was not more than ten days or two weeks old. Of the other two species all seemed fully grown. Among the Arizona quail the males outnumbered the females, it seemed to me, at least five to one, or even more than that. There is a possibility that the females may have kept more to the brush than did the males, and consequently were less exposed to the gun of the collector, but this can hardly be, inasmuch as we closely examined large bunches of quail on the outside with the same result.

The investigations above detailed make it appear clear to me that in this vicinity the common form of *Colinus*, hitherto referred to as *Colinus graysoni*, is really *C. ridgwayi*. Whether the former species also occurs can only be determined by further examination of a wide range of country. This I hope to be able to undertake at some future day.

HERBERT BROWN.

TUCSON, Arizona, Oct. 30, 1885.

EXPERIENCE WITH SAVAGE DEER.

Editor Forest and Stream:

The item, "A Pet Deer on the Rampage," in your issue of Dec. 10, reminds me of the story of a "scrimmage" with a wounded buck once told me by the survivor, as we lay at full length on our blankets, spread upon a thick bed of fragrant balsam boughs, and with our feet stretched toward a blazing pile of hardwood logs, while we rested after a hard day's snowshoing in a forest on the south shore of Lake Superior. Having finished our frugal, but abundant, meal of camp bread, bacon and tea, and the pipes lighted, story telling was in order.

"Speakin' o' wounded deer fitin'," said S——, a veteran woodsman, explorer and hunter, "did I ever tell you o' the buck I shot with a maple stick?"

"No, I don't think you ever did. Let's have it."

For a few moments S—— looked into the glowing fire at his feet and puffed vigorously at his pipe, while he seemed to see again, through the fragrant smoke and in the living coals, the encounter he was about to describe. The others, knowing his way, smoked in silence until he began:

"It war in 1867, in Muskegon county, Lower Peninsula. I war living there then. One day I went out to look for a lost ox, and, o' course, took the ole gun along. It warn't one o' these yer pumps, sech as we use now days, with which ye kin pump a deer full o' lead in a minnit; but it war the best ole muzzleloader I ever see. It carried 'bout sixty to the pound, an' when I drawed a bead on anythin' alive it war 'most allus my meat. After bein' out till noon an' seein' no game 'cept patridges, an' lots o' them, I thought I mout's well take home a mess o' birds, so I commenced poppin' 'em over whenever I got a good chance at their heads. I kep' this up till I found I only had one bullet left, an' that I tho't I'd keep until I got near home. As I war on the way home, I kem to a small lake, an' as I looked over it I see a big buck wadin' across a shallow place in the water. It war a pretty long shot, but I hed made longer with the ole gun, so I banged away. The buck stopped, an' I could tell by the way he acted that he war hit. I got back in the woods an' crawled toward him, an' thar he stood, lookin' all aroun', not knowin' yet where the shot kem from. As I got nearer I saw that he war bleedin' good, but I war afraid he'd git away. I hed plenty o' powder but no lead. Finally I thought o' the way I'd seen 'em stun pigs 'fore stickin, 'em, by shootin' 'em with a wooden plug an' a small load o' powder, an' I thought ef I put a long plug an' a big load o' powder in the old gun mebbe I could down him. I laid low an' whittled a green maple sprout down to fit the gun an' cut it off 'bout six or eight inches long an' put 'bout three inches o' powder in the ole gun, put on a patch jest as though it war a bullet, an' rammed my stick down an' put on a cap. Then I raised up an' took a look at the buck. He war sick an' stood still yet, but he war too fur away fer my wood bullet, so I waded out toward him, ready to shoot ef he should start to run. But he only looked at me, an' once in a while he'd shake his head or stomp his foot in the water, which was only 'bout knee keep. I kep' a walkin' up until I war 'bout fifty feet away, an' then I aimed fer his neck an' blazed away. Well, sir, 'fore I got the gun away from my shoulder that buck hed me on his horns a swashin' me around in the water so't I thought he war goin' ter bail the lake out with me. It didn't last but a minnit, an' it didn't need ter, ter make me think the air was full o' bucks an' water. Then he fell with his head in the water, an' me on top, an' in a minnit more he were dead. He had bled so much that he war 'most dead when I fired the last time, an' it war just as well fer me that he war, fer it war the almightiest hustlin' ever I got, an' if a dead buck kin shake a man up like that I don't want no truck with a live one at short range." After a pause, "An' I never hit him with the wooden plug."

JAY EMELL.

Editor Forest and Stream:

Something in the paper concerning the viciousness of tame deer reminds me of an encounter of my father and a cousin of his, with a tame doe. My father was about fourteen, his cousin four years or so younger, when one "Fifth Day" after Friends' Meeting, my grandfather sent them to a field in sight of the meeting house to get a clevis that had been left on a stump. While going or coming the deer attacked them, rearing up and striking with her forefeet. She made at the younger boy first and knocked him down, when my father's lusty cries for help drew her attention to him. He had the presence of mind to fall face downward, and after thumping him on the back a few times, the doe renewed her attack upon the smaller boy, who was too much frightened to guard himself at all, and was quite seriously hurt before my father's shouts brought a party of stout Quakers to the rescue.

Uncle Byrd, cousin Tom's father, presently "sot down and wrote a letter" to Martin Shellhouse, the owner of the doe, that caused sentence of death to be passed upon her and speedily enforced. I was not there and it happened some years further back than my recollection runs, about 1810, but I was well acquainted with my father, and have no doubt of the truth of the story, which he circumstantially narrated to me several hundred times during my boyhood.

AWAHSOOSE.

HARE AND OTTER.—*Editor Forest and Stream:* While hunting caribou in the Laurentian Mountains, north of this, a few days ago, on approaching one of the numerous lakes that abound in that range I observed a hare crossing a bay at a distance of 300 or 400 yards from where I stood, running at the top of its speed. While watching the hare I observed at some distance behind it an animal which I at once took to be an otter, from its appearance when it sat up on the ice, as it did the moment I noticed it, having no doubt heard my man calling my attention to the hare. This man, who has passed most of his life in these woods, immediately exclaimed, "Une loutre" (an otter). On my firing at it, it started again in the same track the hare had taken, making quick, clean jumps, and covering at each about the same space as the hare had done. Another shot from my rifle and the animal took its back track and disappeared in the woods whence it had come in pursuit of the hare. What I want to know from yourself or any of your correspondents is, do otters chase or capture hares, or would they eat a hare? If not an otter, what animal would it probably be? It was not a black fox.—H. R. (Montreal).

LIVE ELK AND ANTELOPES.—A Wyoming correspondent writes us: "I have a live male elk, very tame, and a nice pet. It will follow me anywhere and eat anything. I have also two live antelopes; they are very gentle, and make interesting pets. All are sound, hearty and thrifty." We believe that these are for sale.

THE BAILEY COLLECTION OF EGGS.—This splendid collection of the nests and eggs of North American birds is now in process of arrangement on the top floor of the American Museum of Natural History. It will be remembered that this collection was purchased from Mr. E. H. Bailey by Mr. M. K. Jesup, and by him presented to the museum. The price paid was said to be about $4,000. There are about 7,000 specimens, which will be displayed to the best advantage when the collection is finally opened to the public. In many respects the display, it is said, will be very interesting and quite unlike anything hitherto seen here. A part of the plan in arranging the eggs is to have the male and female bird mounted on boughs of the trees or shrubs mostly resorted to by the species, and whatever may illustrate the life and habits of the bird, including a plainly printed label, giving the more important facts. When completed this collection will be fully appreciated, and its usefulness in teaching young naturalists will be great, as the specimens, being scrupulously identified, will serve the important purpose of examples, with systematic nomenclature for purpose of comparison. The exhibition will not be open to the public before spring.

ALBINO RUFFED GROUSE.—We were shown a few days since a curious and beautiful albino ruffed grouse, brought to this office by Mr. Joseph E. Case, of Flemington, N. J. At a little distance it looks like a pure white bird, but a close inspection shows it to be the palest possible shade of gray and the characteristic markings of each feather are still to be seen. The specimen was shot about Dec. 1 by P. Skillman, in Tunkhannock, Pa. The head was shot off and it has been necessary to put on the bird another head of the ordinary brown color. The bird was mounted by Wallace in excellent style, and makes a beautiful and interesting specimen.

HORNS OF THE FEMALE CARIBOU.—New York, Dec. 24. *Editor Forest and Stream:* Some little time since there was considerable argument regarding antlers on female caribou. I have just returned from the woods near to the Restigouche River, Bonaventure county, Province of Quebec, where I have been hunting with "Globe Sight," of New Glasgow, Nova Scotia, for the past few weeks, and have on exhibition at No. 952 Sixth avenue for a few days, a splendid specimen of female barren ground caribou with antlers.—LAWSON B. BELL

Game Bag and Gun.

GUIDING VERSUS HUNTING.

THE sportsman who desires to know what his chances for the future are, can find their index in our great markets. It is interesting to follow these markets. Boston, the "dumping ground," concerning which market so much has been written, is not getting the usual quantity of game. Now this is something to be glad about, good readers of the FOREST AND STREAM. There is no lack of energy on the part of the game dealers, but gradually guides and gunners are finding that market hunting does not pay. Besides the thorough obedience to the game non-transportation law of Maine, New Hampshire and New Brunswick, by the sensible railroad and steamboat officials, has cut off the supply of game from the North surprisingly small. It is mainly the West that the sportsman now has to tremble for. A few quail are coming, ostensibly from the West, and probably they do so come in nine cases out of ten. Some fifty boxes were received here yesterday, but there is nothing like the 200,000 which were in store here two years ago; and if we may believe the receivers, they are not on the way. Of ruffed grouse but very few indeed have come to this market—"Scarcely enough to make a show of having any," as a prominent dealer remarked to-day. Prairie chickens have been more plenty than partridges, but hardly more than half of former seasons thus far. The low prices received for them and the high cost of freights discourage the Western shippers—so the marketmen say—and as for those who shoot the birds their pay is merely nothing.

Yesterday fifty saddles of vension were received from Minnesota, the first large shipment to this market this season. These saddles, enveloped in the hides, brought $18 per cwt., laid down in the market here—too good a price, for it may encourage the shippers. But after all the hunter got but very little for this venison. The freights and cartages count nearly $3 per cwt., besides there are commissions and dealers, profits to be deducted. It is hardly probable that the hunter got more than $5 apiece for the deer he killed. If the Western railroads looked upon the game of the regions they penetrate with the good sense of Superintendent Tucker of the Maine Central—as sources of wealth to his road from future summer travel—they would refuse to forward game from the fast depleting Western States.

As an instance of how poorly the hunter who kills the game is paid, a single caribou shipped to this market last month may be mentioned. The specimen, a fine one, came from Lincoln, Maine. He came secreted in a car-load of potatoes, else the railroad officials would not have taken him. It was mentioned that the animal was dragged by hand six or eight miles through the woods to the vicinity of a team, then carted 15 miles to the railroad. Very cautiously he had to be smuggled into the potato car, and after reaching Boston the carcass minus the entrails, sold for ten cents per pound. The horns, a fine pair, very slender and smooth, were knocked off in transit, and disappeared.

Guiding numerous city sportsmen after this caribou—who never would get him—say 100 days at $2.50 per day, would have paid the hunters much better. The more intelligent hunters are beginning to see through the problem. Put the FOREST AND STREAM, for six numbers, into any hunter's hands, provided he can read, and he turns from hunter to guide. In the one case he follows often imaginary moose, caribou and deer, with a would-be sportsman who feeds him well and houses him with the best there is. Besides, his pay is sure—game or no game. In the other case, he follows the animal perhaps for days; hungry, cold and often alone. If he kills his prey, then comes "a terrible lug," without which there is no reward. "No more market hunting for us," say the hunters who are beginning to be informed, "but give us plenty of guiding." The sportsmen say, amen! Verily, does not this solve the problem of game depletion? SPECIAL.

A LEAF FROM THE PAST.

WHEN I read the delightful graphic account of the manner in which "Mississippi Lowlands" killed his first deer, memory carried me away back nearly a quarter of a century to the time when, a raw youth just released from the thraldom of the desk, I plunged into the free-and-easy backwoods life of Vancouver Island. The golden glitter of Cariboo had dazzled many a green young Britisher and tempted him to try his luck in the far west. A goodly share of these unsophisticated individuals landed in Victoria in the winter of '62, months too early to accomplish anything in the direction of reaching their El Dorado. Being one of the number, I made up my mind to inure myself to prospective hardships by passing the winter in Cowichan with an old friend, who had preceded me by a few months and who had pre-empted a piece of land there. After a trip by land and water of forty or fifty miles, I found S. snugly housed with his next neighbors, a pair of sturdy Englishmen, whose name, to all who know them, is still a synonym for hearty hospitality and sterling worth. The brothers' cabin was literally packed with incoming settlers who had not yet been able to build homes of their own, and prominent among these was a Scotch Canadian, usually known as "Tam," an odd mixture of cynicism and good nature, and passionately fond of hunting.

Tam and I struck up a warm friendship from the start, and when I confided to him my keen longing to kill a deer, he sympathetically voluntered to lend me his beloved Kentucky for a day's hunt, an offer which was of course gladly accepted. As I was utterly unaccustomed to the use of a rifle, he carefully explained the action of the triggers, the style of sighting, the correct method of loading and so on, till I was quite satisfied that I knew it all. He then started me up the mountain whose lower slopes ran down to the settlement, cheering me with the parting remark that I need not be afraid of getting lost, for "any fool could tell whether he was traveling uphill or down." I had climbed steadily upward for probably half an hour, and was on a sharp backbone bordered by deep ravines, when a forked buck started from his bed sixty or seventy yards away, and stood, broadside on, calmly surveying me. Till that supreme moment I had thoroughly understood everything connected with the management of the rifle, for, to tell the truth, I had made assurance doubly sure by experimenting a little on the way up. But now, alas!, the delirium of buck fever had firm hold on me, and, no matter what I did with that devoted weapon, I could not make it go off. That's exactly where it differed from the buck, for, after gazing pityingly at my fruitless efforts, and apparently disgusted at the idea of wasting his precious time on a tenderfoot, he turned tail and went off up the ridge in fine style. Under the circumstances I thought his example a very excellent one to follow, so I turned tail also and struck for home, completely crestfallen, and dreading the roasting that awaited me. The boys were merciful, however, and let me down easily, the bitterest pill of all being Tam's curt refusal to let me have anything more to do with his rifle, until I had practiced for a time with a shotgun. I am strongly inclined to think that in Tam's eyes my vile handling of his darling had somehow brought discredit on her, for he instantly emptied her at a mark and gave her a thorough overhauling inside and out, as if to wipe away the unmerited disgrace I had inflicted upon her.

During the following week S. and I were engaged in splitting rails and making preparations for the erection of his cabin, the scene of our labors being probably three-quarters of a mile from our temporary home. Every evening, just before quitting work we used to chop down a fir or two, and every morning we would notice that deer had been browsing on the mossy branches. This suggested to S. the idea of an early morning visit on my part with every probability of getting a shot. He had a handy single-barreled gun, throwing ball tolerably well, and, seeing that Tam's rifle was unavailable for the present, he offered me the use of it. Just at dawn of a drizzly day he handed me the gun, carefully loaded by himself and warranted therefore to be O. K. He pooh-poohed the notion of taking any extra ammunition, as I would be able to get a close enough shot to make sure work. On the previous evening we had mapped out my course, and had fixed on a giant fir from which I was to shoot. Having reached its foot I waited a moment or two to steady myself and then, when I peeped past its gnarled trunk, my heart thumped and banged enough to take my breath away, for, browsing on the bait we had felled, were a fine buck and a couple of does. I can never forget the noble sight he presented when, half-conscious of an intruder, he raised his antlered head and gazed inquiringly in my direction. A brief space I stood with the cocked gun rested against the side of the tree, my finger on the trigger, ready to shoot. Well can I remember that, even in the ardor of my longing, there flashed across me a pang of compunction at the thought that another instant would end the life-course of the beautiful animal. Shaking off the unworthy weakness, I took deliberate aim behind his shoulder, pressed the trigger, and down came the hammer—clink. He gave one startled jump and stopped. Hardly able to hold the gun from excitement, I raised the hammer again, pulled again, and—clink—again. Away bounded the buck and his companions into the underbrush, leaving me, like Lord Ullin, lamenting. I am afraid that lamenting was succeeded by something suspiciously akin to upbraiding when an examination into the cause of my disappointment revealed the fact that my infallible friend had neglected to put a cap on the nipple.

Piqued by adverse Fortune, I determined to kill a deer in spite of the fickle goddess, so I started off the next morning for a quiet hunt, being particular this time to have a cap on the nipple. Part of the land which S. had taken consisted of a thick, swampy bottom much frequented by deer, and skirted by a gentle sloping ferny ridge. While traveling along this slope I saw a doe leisurely get up and stretch herself. Taking careful sight at the spot where I supposed her head to be, I fired, and simultaneously with the crack of the gun she fell. Was there ever a prouder or more delighted youngster in the world? I threw my cap heavenward and gave vent to my overcharged feelings in a lusty "hurrah." Scarcely had the triumphant sound escaped my lips before that provoking animal had struggled to her feet and was beginning to make off, slowly at first, but gaining strength by rapid degrees till at last she backed out of sight as briskly as if she had never been touched. Down went the corners of my mouth; the heart that had been light as a feather a minute before felt as heavy as lead, and I turned my steps homeward profoundly impressed with the futility of bucking against fate. I had a flickering hope that, on hearing my tale, Tam might be moved to remove the embargo from his rifle, but on throwing out a gentle feeler, the only consolation I got was, "Come down to buckshot, my lad."

A few days later, Tam and S. arranged to ha near a creek flowing by the outskirts of the settle by Mr. magnanimously gave me permission to join them. Mr. M paring for the great event I took Tam's advice an me down to buckshot. To avoid any difficulty that might arise from the extreme likelihood of my being lost in the bush, they instructed me to keep close to the bank of the stream, a course which I followed so faithfully that I might certainly claim to have emulated that famous character whose remarkable exploits in a bramble-bush have been immortalized in the familiar nursery rhyme. However, if my flesh and clothes were lacerated, my conscience was not, for I had very literally obeyed orders, even at a slight sacrifice of common sense. After toiling along for a considerable time through brake and brier, a distant yelp announced that a fourth and uninvited party had joined the chase in the person of a mongrel cur remarkable beyond his fellows for a ravenous appetite and a mania for disobedience. As his frequent and nearing barks warned me he was on the track of a deer and was driving it toward me. I had just reached the edge of a little clear space in the woods, and was waiting in the shade of a clump of firs when the hunted deer came bounding across the opening. As he was passing me about forty yards off I let him have the load of buckshot, but without any perceptible effect, for he never swerved, but ran down the bank of the creek. When the dog came along on the track he followed into the creek bed and crossed it, but failed to pick up the scent on the other side. He tried it again and again but without success, till at last, being completely baffled, he gave it up as a bad job. While I was looking for sign S. came up, and instantly plunged into the water and hauled out what Tam was careful to inform us was the most diminutive specimen of the deer family he had seen in Vancouver Island woods, but what cared I for that? As home is home no matter how humble, so a deer is a deer no matter how small, and my luck had turned at last. When we had skinned and dressed the prize, S. proudly pointed out the hole in the heart where the buckshot had done its deadly work, while Tam, who had been examining the skin, calmly inquired, "Oh! man, do you use only one buckshot in your gun?" But then Tam was doubtless jealous, for notable hunter as he was, he had failed to score. I regret to say that the four-footed cause of my success afterward came to an untimely end through his inability to restrain his passion for eggs. R. M. C.

CACHE CREEK, B. C.

THE VEST BILL.

FOLLOWING is the text of the bill (S. 101) introduced into the Senate on Dec. 8, 1885, by Mr. Vest, read twice and referred to the Committee on Territories:

A BILL to amend sections twenty-four hundred and seventy-four and twenty-four hundred and seventy-five of the Revised Statutes of the United States, setting apart a certain tract of land lying near the headwaters of the Yellowstone River as a public park.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the boundaries of the Yellowstone National Park, as now fixed by section twenty-four hundred and seventy-four of the Revised Statutes, shall hereafter be as follows: Beginning at a point on the forty-fifth parallel of north latitude where said parallel is intersected by the meridian of one hundred and eleven degrees west longitude; thence due east to a point five miles from the eastern boundary of the park as now established; thence due south five miles; thence due east to the meridian of one hundred and nine degress and thirty minutes west longitude; thence due south along said meridian to the forty-fourth parallel of north latitude; thence due west along said parallel to its point of intersection with the meridian of one hundred and eleven degrees west longitude; thence due north along said meridian to the place of beginning; and it shall be the duty of the Secretary of the Interior to cause an accurate survey to be made of the boundary lines of said Park as established by this act, said survey to be recorded in the offices of the surveyor-general and Commissioner of the General Land Office of the United States, as provided by law.

SEC. 2. That all of the territory embraced within the limits of the Park as herein established shall be reserved and withdrawn from settlement, occupancy, or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure ground for the benefit and enjoyment of the people of the United States; and said territory so set apart shall be under the control of the Secretary of the Interior, and subject to all the provisions of sections numbered twenty-four hundred and seventy-four and twenty-four hundred and seventy-five of the Revised Statutes of the United States, except as herein otherwise provided.

SEC. 3. That the Secretary of the Interior shall make and publish such rules and regulations as he may deem necessary and proper for the management and care of the park, especially for the preservation from injury or spoliation of all timber, mineral deposits, natural curiosities, or wonderful objects within said park, and for the protection of the game animals found in the Park, to prevent their capture or destruction. He shall cause all persons trespassing upon the Park to be removed therefrom, and shall take all measures which he may think necessary to carry out the purposes of this act; and the Secretary of War is hereby directed to make such detail of troops as the Secretary of the Interior, with the approval of the President, may require for the purpose of preventing trespassers or intruders from entering the Park with the object of destroying the game therein, or other illegal purposes, and for removing such persons from the Park.

SEC. 4. That the killing, wounding, or capturing at any time of any buffalo, bison, moose, elk, deer, mountain sheep, Rocky Mountain goat, antelope, beaver, otter, martin, fisher, grouse, prairie chicken, pheasant, fool-hen, partridge, quail, wild goose, duck, eagle, magpie, swan, heron, sparrow, robin, meadow lark, thrush, goldfinch, flicker or yellowhammer, blackbird, oriole, jay, snowbird, or any of the small birds commonly known as singing birds, is prohibited within the limits of said Park; nor shall any fish be taken out of the waters of the Park by means of seines, nets, traps, or by the use of drugs or any explosive substances or compounds, or in any other way than by hook and line. Any person violating these provisions of this section shall be deemed guilty of a misdemeanor, and upon conviction shall be fined for each offense not less than twenty nor more than one hundred dollars, or by imprisonment for not more than three months, or by both such fine and imprisonment. Possession within the said Park of the dead bodies or any part thereof, of any of the animals or birds hereinbefore mentioned shall be *prima facie* evidence that the person or persons having the same are guilty of violating this act. Any person or persons, or stage, express or railroad company, receiving for transportation any of the animals, birds or fish named herein, knowing or having reasonable cause to believe, that such animals, birds or fish were killed or captured in violation of this act, shall be deemed guilty of a misdemeanor and shall forfeit and pay for every such offense the sum of two hundred and fifty dollars, to be recovered by a proceeding in the nature of an information before any territorial or United States district court, within whose jurisdiction such offense was committed; and it shall be the duty of the district attorney of the United States for such Territory or district to institute and prosecute said proceeding in the name of the United States, the amount collected from the party offending to be paid into the Treasury of the United States.

SEC 5. That the Secretary of the Interior may lease small portions of ground in the Park, not exceeding ten acres in extent for each tract, on which may be erected hotels and the necessary out-buildings, and for a period not exceeding ten years; but such lease shall not include any of the geysers or other objects of curiosity or interest in said park, or exclude the public from the free and convenient approach thereto, or include any ground within one-quarter of a mile of any of the geysers or the Yellowstone Falls; nor shall any hotel or other buildings be erected within the park until such lease shall be executed by the Secretary of the Interior; and all contracts, agreements or exclusive privileges heretofore made or given in regard to said park, or any part thereof, inconsistent with this act, are hereby declared to be invalid; nor shall the Secretary of the Interior, in any lease which he may make and execute, grant any exclusive privileges within said park except upon the leased ground.

SEC. 6. That the President shall appoint, by and with the advice and consent of the Senate, a commissioner, who shall reside at Mam-

but the springs, in said park, and who shall have jurisdiction to determine all complaints made of any and all violations of a vital sp[illegible]nd regulations made by the Secretary of the Interior for care to ument of the park and the protection of the game and objects of interest therein. He shall have the power to issue process, in the name of the United States, for the arrest of any person charged with the commission of any misdemeanor within the park, and to summarily try the person so charged, and, if found guilty, to fix the punishment as in the next section provided. The said commissioner shall also have power to issue process, as hereinbefore provided, for the arrest of any person charged with the commission of any felony within the park, and to summarily hear the evidence adduced; and if he shall determine that probable cause is shown for holding the person so charged for trial, he shall cause such person to be safely conveyed to a secure place of confinement within the jurisdiction of the United States District Court nearest and most accessible to the park, and shall certify the record of his proceedings in the case to said district court, which court shall have jurisdiction of the case and proceed therein as provided in chapter eighteen, title thirteen, and chapter three, title seventy, of the Revised Statutes of the United States, the punishment inflicted to be the same as prescribed in the last-named chapter for like felonies. All process issued by the commissioner shall be directed to the superintendent of the park, who, with his deputies or assistant superintendents, shall have the same power to execute the same as is vested in the marshals and deputy marshals of the district courts of the United States for the execution of writs from said courts. The forms and proceedings had before said commissioner shall conform, as near as may be, to the forms and proceedings in criminal cases before commissioners appointed by the courts of the United States as now provided by law; and the said commissioner shall receive the annual salary of one thousand two hundred dollars, to be paid quarterly, as in the cases of judges of territorial courts for the respective Territories.

SEC. 7. That all costs and expenses arising in cases under this act and properly chargeable to the United States shall be certified by the commissioner of the Department of Justice, and, if approved by the proper officers of that Department, shall be paid as other such costs in the United States courts. The violation of any regulation made and published by the Secretary of the Interior in regard to the control and management of the Park, and the protection of the game and property therein, is hereby declared to be a misdemeanor, and the party convicted shall be punished for each offense by a fine of not less than twenty nor more than one hundred dollars, and be committed until such fine is paid, or by imprisonment for not more than three months, or by both such fine and imprisonment.

SEC. 8. That the Secretary of the Interior shall cause to be erected in the Park a suitable building to be used as a jail, and also an office for the use of the commissioner, the cost of such building to be paid out of any money in the Treasury not otherwise appropriated, upon the certificate of the Secretary as a voucher thereof.

SEC. 9. That the Secretary of the Interior shall appoint a superintendent of the Park, who shall be paid an annual salary of two thousand dollars, and fifteen assistants, who shall each be paid nine hundred dollars; and it shall be the duty of said superintendent and his assistants to reside continuously in the Park, and to protect the game and public property, to preserve the peace, and prevent crime; and for this purpose they shall have power to arrest all persons committing any crime or misdemeanor within the park, and shall also have all the powers and duties conferred by law upon the marshals and deputy marshals of the district courts of the United States: *Provided*, that the power hereby conferred shall be exercised only within the limits of said park, and in conveying persons arrested for felony to the United States district court nearest and most accessible to the park: *And provided also*, That nothing herein contained shall be construed as preventing United States marshals or officers of State or Territorial courts from serving within the territory of the park any writ or process issued by lawful authority: *And provided also*, That no timber in said park shall be cut, either for building purposes or for fire-wood, except by the permission, in writing, of the superintendent of said Park, specifying the place at which said timber may be cut, and the quantity thereof.

SEC. 10. That the Secretary of War shall detail an officer from the Corps of Engineers whose duty it shall be to survey and lay out suitable roads in said park and select the proper location for bridges therein; and the Secretary of War shall, upon the report of said officer, make annual estimates for the cost of such improvements, and communicate the same to Congress, with such other recommendations in regard to the Park as he may deem proper; and all sums received by the Secretary of the Interior from rents in the Park, or arising from fines or forfeitures for violations of the laws and regulations made for the government of said Park and protection of the game and public property therein, shall be applied to the improvements hereinbefore mentioned; and the officer or officers collecting said fines and forfeitures shall pay the same to the Superintendent of the Park to be accounted for by him to the Secretary of the Interior.

SEC. 11. That all leases, contracts, rules and regulations made or issued by the Secretary of the Interior, as herein provided for, shall be subject to the approval of the President.

SLEEPING BAGS.

Editor Forest and Stream:

I have noticed several allusions, at different times, in the FOREST AND STREAM, to sleeping bags for extremely cold camping, and would like to get some idea as to their dimensions, form, material, and as to what I will find the most comfortable and convenient thing to take along for sleeping in on a midwinter hunt. The intention is for five of us, who have hunted together every fall for a number of years, to start from this place at some time in January, driving back as far as practicable, and then snowshoe it over into the Cold River region, or wherever we can find any panther, and if we can find any, give them a twist. If any signs are found in that region, and it is about as promising as any we have heard of, we shall probably build a camp and hunt from that as headquarters. I know that a good many hardships, in the way of cold weather, etc., will have to be undergone, and anything that can be done to lessen them and render the trip more comfortable I want to do.

W. C. W.

PORT HENRY, N. Y.

[The sleeping bags in question are very simple and easily made. They are usually oval and oblong and the ordinary size is six and seven feet in length by three or four wide. The bag should be double, the inner one being of the skin selected, and the outer of canvas, duck or drilling. The two should be sewed together around the top and at the corners at the feet. A stout string—tape or cotton cord—should run around the opening of the bag so that if he desires to do so, the occupant can tie the bag tight about his throat. A sleeping bag is an enormous addition to one's comfort in cold weather, and the only objections we have ever heard urged against them is that when the weather is not very cold they are too warm for comfort. Obviously the reply to this is that one need not sleep in his bag in warm weather, but can spread it under him and cover himself with as few or as many blankets as may suit him. The choice of a skin for the inner bag may present some difficulties. Blanket is sometimes used, but it is not nearly so comfortable nor so warm as fur. The skin should be light and dressed very soft, and should at the same time be well furred. Buffalo is too heavy, caribou skin is highly recommended and would be admirable we imagine in very bitter weather. Lynx is light and well furred. One of the best of the bags that we have seen was made from a number of small skins, apparently of dog. We think that woodchuck skins in good fur would make a capital bag. It would be well in making a bag for use in an open camp where one may have to sleep close to the fire, to have the canvas or duck which forms the outer envelope, dressed with some preparation which would make it fireproof. Most of those who have camped in this way will remember how often they have had their blankets burned by sparks which snap from the fire during the night, and as canvas might catch from a spark and smoulder a long time, the bag might easily be ruined—the outer covering being burned and the skins scorched.]

"Forest and Stream" Trajectory Test.

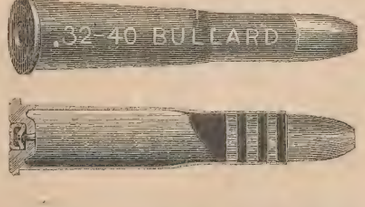
(*Continued from page* 430.)

Stevens .32 R. F.

This weapon is a sample of the old-time Stevens rifle, using a rim-fire cartridge with small charge of powder. It was, in fact, the same cartridge used in the Remington .32 R. F. weapon, and the same weighing up of charges and bullets hold as in that arm, the powder running 11.9, 12.4

and 12.2 grains, while the bullets were 88.6, 88.9 and 88.7 grains. The powder was in fine condition, and the bullets had three grooves. The ammunition was of U. M. C. Co. make. The weapon weighed, complete, 8 pounds 9½ ounces, while the barrel alone weighed 4 pounds 2 ounces. The weapon was numbered 14,302, and had a 30-inch octagonal barrel. There were six grooves of uniform twist, having one turn in 20 inches.

The trial at 200 yards was made on Oct. 1 at 11 o'clock in the morning, with the wind coming from the 7 o'clock quarter at ten miles per hour. The barometer recorded 30.120 inches, the dry thermometer 78° and the wet-bulb thermometer 65.4°, showing a dew point of 56.2 and the atmospheric humidity at 47 per cent. The trajectory heights stood:



Round.	50 Yards.	100 Yards.	150 Yards.
2	12.718 in.	18.019 in.	13.876 in.
3	12.852 in.	18.079 in.	14.193 in.
4	12.439 in.	17.698 in.	13.583 in.
5	13.312 in.	18.562 in.	14.341 in.
7	12.622 in.	17.735 in.	13.645 in.
Average...	**12.788** in.	**18.018** in.	**13.927** in.

At 100 yards the test came on Oct. 10, about 9:15 in the morning, with the barometer standing at 30.320, the dry thermometer 58° and the wet-bulb thermometer at 52°, indicating a dew point of 46 and a humidity of 65 per cent. The wind at the time was blowing at 7 miles per hour from the 10 o'clock quarter. The short range trajectory figures stand:

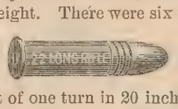
Round.	25 Yards.	50 Yards.	75 Yards.
1	2.773 in.	3.735 in.	2.993 in.
3	3.056 in.	3.814 in.	3.175 in.
4	2.945 in.	3.652 in.	3.036 in.
5	2.985 in.	3.736 in.	3.137 in.
6	2.900 in.	3.794 in.	3.198 in.
Average ...	**2.932** in.	**3.746** in.	**3.108** in.

Bullard .32.

This weapon closed the Bullard list and behaved very well in the rest. Its full weight was 8 pounds 8 ounces, and in the barrel alone were 3 pounds 5 ounces of metal. It had a 26-inch octagon barrel, and was numbered 1528. The rifling was uniform, the six grooves having each a uniform twist of one turn in 16 inches. The grooves were .004 inch deep and .080 inch wide. The loading was with U. M. C. Co. cartridges marked .32 40-150, and three when opened turned

out the powder in good condition. The bullets, having a composition of 1 tin to 16 lead, had three grooves each and weighed 150 1, 150.3 and 150.2 grains, while the corresponding powder weights were 38.8, 39.4 and 38.2 grains. The 200-yard shooting was performed on Sept. 30 at 11:50 A. M., with the wind at nine miles an hour from the 7 o'clock quarter. The barometer stood 30.05 inches, the dry thermometer 78.5°, the wet thermometer 68.5°, showing a dew point of 63.5 and a humidity of 58 per cent. The trajectory heights stood:

Round.	50 Yards.	100 Yards.	150 Yards.
2	7.986 in.	11.373 in.	8.748 in.
5	7.906 in.	11.428 in.	8.657 in.
7	7.742 in.	11.044 in.	8.489 in.
8	7.773 in.	11.083 in.	8.509 in.
9	8.259 in.	11.786 in.	9.012 in.
Aversge.....	**7.933** in.	**11.342** in.	**8.673** in.



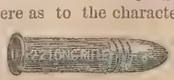
The 100-yard shooting of this arm was done on Oct. 10, with the wind coming eighteen miles per hour from the 1 o'clock quarter. It was 8:50 o'clock and the barometer stood 30.310 inches, the dry thermometer 51.5° and the wet-bulb thermometer 48.5°. This would show a dew point of 45.5 and a humidity of 80 per cent. While the arm was on the rest and shooting very steady it was thought a good time to test one question which had been suggested during the tests. This was the determination of just how much and to what degree the tests were affected, if at all, by the intervening screens. "Oh, you will find that the screens, even if of gossamer, will have some effect in deflecting the bullet from a true, fair curve," said one well-known rifleman. "All right, then, we will determine that question very quickly," we said, "and find out what the retardation is and how the trajectory curve is affected." We know that a fluttering leaf may very sensibly change the course of a flying bullet, and that with screens set at an angle to the line of fire a certain carrom or ricochet effect might be produced. For this reason great care had been taken in having the screens set square across the fire line.

When five shots had been fired the 25-yard screen, nearest the rifle, was taken down, and without disturbing the others three more shots were fired, making a record on the remaining targets, and then to have the record complete the 50-yard or central screen had its ink line record taken and was then removed, leaving the bullet with an uninterrupted passage to the t arget except through the 75-yard screen. The record is given in full and it will be found that there is no material difference whether the record is made at once through three screens or whether only one is used. To try the various distances through one screen at a time, would have consumed much time and besides would have prevented entirely the detection of that gyratory, corkscrew flight of the bullet so clearly shown in the case of several of the large caliber rifles. The full record stands:

Round.	25 Yards.	50 Yards.	75 Yards.
1	1.958 in.	2.339 in.	2.001 in.
2	1.938 in.	2.278 in.	1.984 in.
3	2.062 in.	2.470 in.	2.064 in.
4	2.104 in.	2.541 in.	2.175 in.
7	2.175 in.	2.591 in.	2.211 in.
Average....	**2.047** in.	**2.443** in.	**2.087** in.
		2.554 in.	2.144 in.
		2.352 in.	2.002 in.
		2.611 in.	2.213 in.
			2.114 in.
			2.030 in.
			2.145 in.

Winchester, Long .22 R. F.

The list of rifles closes with two of .22-caliber. The first of this pair is the Winchester, using the long .22 rim-fire cartridge. The arm is of the 1873 model, with a 24-inch octagonal barrel, and was shop-marked 191,651B. It weighed complete 9 pounds 3 ounces, and had a barrel of 3 pounds 9 ounces weight. There were six grooves, each having a uniform twist of one turn in 20 inches, and a depth of .003 inch and width of .070 inch. The loading was from a box of U. M. C. Co. ammunition. The cartridge was nominally .22-5 40. When opened, the powder in three cartridges was found in fine condition and weighed 4 4, 4.4 and 4.6 grains. The bullets had three small grooves each, and were molded of pure lead. They weighed 40.2, 40.3 and 40.1 grains. At 200 yards the rifle was tested on Oct. 19, at 9:50 A. M., with the wind at four miles per hour from the 8 o'clock quarter. The barometer reading was 30.225 inches, with the dry thermometer at 62° and the wet-bulb thermometer at 58.5°, showing a dew point of 56 and the degree of humidity in the atmosphere at 81 per cent. The arm under these conditions gave the following result:



Round.	50 Yards.	100 Yards.	150 Yards.
1	13.506 in.	18.808 in.	14.455 in.
2	13.023 in.	18.247 in.	14.085 in.
3	13.610 in.	19.066 in.	14.632 in.
4	13.720 in.	19.220 in.	14.952 in.
5	13.594 in.	19.273 in.	14.850 in.
Average...	**13.490** in.	**18.922** in.	**14.614** in.

For the 100-yard trial the little piece was put on the fixed rest Oct. 10, with the barometer at 30.240 inches, the dry thermometer at 62° and the wet-bulb thermometer at 54°, showing that the dew point was 46 and the humidity 56 per cent. of saturation. It was 4:45 P. M. when the test shots were fired, the wind coming from the 9 o'clock quarter at four miles per hour. The trajectory heights show:

Round.	25 Yards.	50 Yards.	75 Yards.
1	3.282 in.	4.219 in.	3.467 in.
2	3.238 in.	4.168 in.	3.382 in.
3	3.158 in.	4.133 in.	3.439 in.
4	3.294 in.	4.259 in.	3.503 in.
5	3.306 in.	4.268 in.	3.597 in.
Average....	**3.256** in.	**4.209** in.	**3.478** in.

Stevens .22, R.F.

The rifle, the last one of our list of sporting and hunting arms, weighed entire 8 pounds 7 ounces and in the barrel alone there were 5 pounds of metal. The barrel was 26 inches long and round. Its shop mark was 15,924. The weapon was cut with uniform rifling, one turn in 20 inches and six grooves. The loading was from the same box of U. M. C. Co. ammunition used in trying the Winchester .22 and the remarks there as to the character and condition of

the charge of course apply here. When tried at 200 yards at 9 o'clock on the morning of Oct. 19 the wind came at 8 miles per hour from the 7 o'clock quarter, while the other observations stand recorded as: Barometer 30.250 inches; dry thermometer 62.5°, wet-bulb thermometer 61°, indicat-

ing a dew point of 59.7 and the humidity of the air as 91 per cent. The record stood:

Round.	50 Yards.	100 Yards.	150 Yards.
3.....	14.911 in.	20.992 in.	16.244 in.
5.....	14.612 in.	20.494 in.	15.844 in.
6.....	14.874 in.	20.722 in.	16.144 in.
11.....	16.015 in.	22.412 in.	17.412 in.
12.....	14.780 in.	20.731 in.	16.066 in.
Average....	**15.038** in.	**21.070** in.	**16.342** in.

For 100 yards trial the tip-up weapon was fitted to the rest at 7 o'clock on the morning of Oct. 12, at which time the wind came from the 2 o'clock quarter with a velocity of 18 miles per hour. The index on the aneroid barometer stood at 30.290 inches, the dry thermometer column rose to 48.5°, while the wet-bulb thermometer stood at 44.8°. This would show a dew point of 39.8 and the humidity in the atmosphere as 71 per cent. The trajectory table stands:

Round.	25 Yards.	50 Yards.	75 Yards.
1.....	3.539 in.	4.602 in.	3.790 in.

THE LYMAN SIGHT.

Editor Forest and Stream:

In the Dec. 17 number of your paper "Backwoodsman" describes how he uses my rear sight, and does not agree with my directions about removing the middle sight from the rifle, provided it is made of a shape not to interfere with much of the view.

In reply, I say more than is necessary to meet his case because I know that the majority of those who have my sight use it at a great disadvantage. The three principal faults are: First, they leave the ordinary crotch sight on the barrel, which shuts out a large part of the view; second, they use the small aperture, which makes it too much like a peep sight, and therefore cannot do quick shooting with it; third, they shoot with the sight too far from the eye, which has the effect of making the sight rim appear too wide and the aperture too small, and consequently it obstructs some of the view, making it more difficult to aim quickly. "Backwoodsman" has so nearly avoided all of these faults that I cannot criticise his method of using it very severely. As, however, he comes very far from getting the full benefit from my sight, I will discuss his method. For convenience I speak of the rear sight which is on the barrel of the rifle as the "middle" sight, and my rear sight as the "rear" sight. This

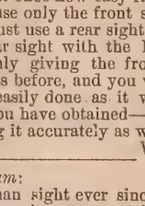
middle sight, which "Backwoodsman" has made by cutting off the top and sides of the ordinary crotch sight, is a great improvement over the ordinary middle sight, for, as he says, it offers little obstruction to the view, and the top of the front sight is plainly visible.

The advantages which "Backwoodsman" claims for his middle sight are that in hunting, where there is no time to change the elevation of the rear sight, "one can use the rear sight by aiming through the lower part, the center, and top of the large aperture, always knowing by the height of the front sight above the middle sight whether the elevation is right." I would say here that as long as the rear sight is not disturbed it can be used in this way quite as accurately when the middle sight is not there; and then when hunting, if a small elevation is needed, it is much better to get it by holding the front sight a trifle high on the object, for it is quite an effort to get the eye away from the center of the aperture, and although this aperture appears so large it is really so small and so far from the front sight that very little elevation can be obtained by looking through it from the bottom and again from the top. "Backwoodsman" very truly says that "if the elevation of the rear sight is disturbed the middle sight will indicate whether it is too high or too low." There is no reason, however, why the elevation should not be right, for the sight can be turned down instantly as far as it will go without even looking at it, and this should be the point blank range.

If for any reason the sight is too short and turns down too far, a piece of brass can be soldered on to the lower end of the sight stem, so that it will be impossible to turn it down too low. Lastly, "Backwoodsman" says, "there are times when this sight cannot be used at all, when it becomes too dark to see with it." Now, as shooting in the dim light is one of the advantages that this rear sight has over any form of middle sight, I will explain how it should be used. As a good test, try it with an ivory front sight and a white bullseye. Use the large aperture and have no middle sight on the rifle. Commence shooting at dusk. As the light becomes more dim the rim of the rear sight becomes indistinct. Do not try to adjust your eye to the aperture, for it will be guided without any effort on your part, but continue to shoot as long as the front sight and the bullseye are visible, and the result will be that you will make a better score than you can possibly make with the middle sight. One is almost sure to overshoot with a middle sight when the light is poor and it is also very difficult to make good line shots. Just here I will speak of the advantage of keeping both eyes open.

In shooting with both eyes open the right eye does the aiming. Although the left eye does not do the aiming it sees everything except the rear sight.

The result is the shooter has more light, does not make the effort of keeping the left eye closed and consequently can shoot quicker and with greater ease—and what is more important—just as accurately as when only the right eye is used.



When the middle and front sights are used alone, double-eyed shooting is more difficult, partly owing to the difficulty of keeping the attention of the left eye away from the middle sight.

But to return to the subject of sights, many who use the rear sight correctly think that the middle sight would be a help to the rear sight in guiding the eye, so that if there was plenty of time to aim the shooting would be more accurate. This is not the case, however; for, as far as aiming is concerned in any ordinary light, the middle sight virtually becomes a part of the front sight when the rear sight is used. The part that it forms is, however, less distinct and twice as large as if it were at the muzzle, and really one could shoot better if it were at the muzzle with the front sight.

I repeat to those whose preconceived ideas will not prevent them from at least trying this sight as it is intended to be used, that the best results can only be obtained when the eye is close to the sight (as it naturally will be if the rifle is held properly) and the middle sight out of the way. Use the small aperture only for target shooting, and even then most persons can do fully as well with the larger aperture, owing to the better light which is obtained. Keeping both eyes open will also be a help, especially if shooting rapidly or in a dim light.

When the rifle is used in this way there are only two things to be considered, viz.: the front sight and the object to be hit. The rear sight does not need your attention and in a short time you will almost be unconsious of its presence. When you make a bad shot do not think it is owing to the aperture of the rear sight being so large, for although its appearance is rather startling to one who has been accustomed to use other sights it would still be accurate if it were considerably larger. It often happens that, owing to a very long rifle stock, or to a bad position when shooting, the sight is so far from the eye that the rim appears too wide and its aperture too small, so that it requires an effort to aim quickly, especially at a moving object. In such a case matters can be improved by having the aperture reamed out $\frac{1}{32}$ inch larger in diameter; but it would be better to remedy the rifle stock or the position and not change the sight.

When first using this sight it is an excellent plan—after adjusting it carefully by shooting at a target—to turn it down and shoot at some near object, using only the front sight as one would with a shotgun.

A FULL VIEW OF THE FRONT SIGHT AND THE OBJECT.

It will be apparent at once how easy rifle shooting would become if one had to use only the front sight, but of course to hit the mark one must use a rear sight.

Now turn up the rear sight with the large aperture and continue shooting, only giving the front sight and the object your attention as before, and you will be surprised to find that aiming is as easily done as it was with the front sight alone and that you have obtained—what is essential in a rifle—means of using it accurately as well as rapidly.

WILLIAM LYMAN.

Editor Forest and Stream:

I have used the Lyman sight ever since it was first given to the public, and no one improvement has added so much to the pleasure of a day in the woods. The first three or four years were spent with varied experiments with the middle sight, among which I recognize the one illustrated in "Backwoodsman's" article. Becoming tired of this, the next move was to knock out the middle sight one morning before starting out on a squirrel shoot. More misses than hits were the result. After securing a reasonably fair bag the rest of the day was spent in target practice, in which was found a constant tendency to undershoot or overshoot, the first caused by the tendency of the eye in a person accustomed to the use of open sights to get down into the notch as close as possible, and the latter by a tendency to cover the game with too much of the front sight. Both of these tendencies are overcome in a few days' practice, not at any regulation target (for that is never seen in the woods), but at knots and spots on the trees and such like objects. When you have become thoroughly accustomed to this sight, which to an old hunter is a complete revolution in rifle sights, you will find that you can do much closer shooting, for the varying lights and shades of the forest will not affect you, and you can shoot fully an hour earlier in the morning and later at night than before. The last game I killed was two squirrels after it was so dark that they were invisible except when outlined against the western sky. Open sights would have been useless long before.

The rule "Backwoodsman" lays down for varying the range by sighting high or low in the aperture, calls for some explanation. The aperture is $\frac{5}{32}$ of an inch in diameter, which, if your sights are 30 inches apart, will give a total variation at 50 yards of 5.63 inches, which may and may not be enough, according to the loads you are using. See trajectory tests in this paper.

AKRON, Ohio.

VAGARIES OF THE RUFFED GROUSE.

Editor Forest and Stream:

During my trip I visited the Winchester, Shawinnegan and Laurentian Clubs' lakes, and consequently traveled through a large extent of virgin forest, in which ruffed grouse are usually found in great abundance. This year there are scarcely any, only one being seen by my party. No one in these parts can suggest a plausible reason for their disappearance. Snaring or slaughter by man has nothing to do with it, as the country is uninhabited.

H. R.

MONTREAL, Dec. 20, 1885.

Editor Forest and Stream:

When we were boys together, Charlie Gilchrist one day paddled me along the shores of Rice Lake. We were in search of ducks, when a grouse took wing from the edge, making straight for the swamp. I winged it, and we both saw where it fell. Jumping ashore, we sought it, but to our surprise, failed to find it at once. I stood near the spot where it fell, and Charlie hunted it in circles without avail. We were nonplussed, and agreed to give it up, when not six feet from us I espied the gentleman standing erect and motionless as a statue; nor did it stir until Charlie took it by the head, twisted its neck and bagged it. This showed great nerve and cunning. When in a tree a grouse is the same solid lump, with not a twist of its head by a hair's breadth.

At times the ruffed grouse exhibits the greatest stupidity, flying slap bang against a barn, and yet at others, fleet as an arrow, goes through the wood, scarcely touching a twig.

A humorous instance of one of its vagaries is the following, which I vouch for: A friend of mine, living in a large house in the city of Belleville, who was given to late hours and "old rye," betook himself to bed and sleep among the "wee, sma'" hours. He had not rested long nor well when he was disturbed by an unusual racket, but dozed off again. About 10 A. M., when he opened his peepers, he saw a bird perched on the footboard winking and blinking at him. Could it be a bird? No, no! he thought. Just as I expected, "Snakes!" At last, half wild with fear and wet with moisture, in desperation he seized a pillow, saying, Beelzebub, here goes!" The bird, knocked off, went bang through a window. Taking courage, to his window, and to his joy saw the subject of his scare, a grouse, dead on the pavement. He told me that he never relished such a dinner as he made from its carcass. The grouse had made its entrance at one window and its fatal exit at the other. Truly this "patridge" is a bundle of inconsistencies.

PICTOU, Ontario.

RIFLES AND SHOOTING.

Editor Forest and Stream:

I have been greatly interested by the letters of many of your correspondents, respecting the trajectory test, but there are two (one in FOREST AND STREAM of Sept 17, by Mr. Van Dyke, and another in the paper of the following week, signed "Mississippi Lowlands") which contain statements that fairly astonish me. In the latter letter the shooting of a .46-caliber muzzleloader is contrasted with that of two breechloaders, a Ballard and a Sharps. Considering that the distance was only 40 yards, there was nothing extraordinary in a heavy small-gauge gun hitting a 2½-inch disc with every bullet when fired from a dead rest. It would require a poor rifle to miss a mark of that size. Certainly the charge of powder was very heavy, but in many of the old-fashioned American rifles the danger of stripping was almost obviated by making the grooves with only a twist in about 6 feet, and probably with the light round bullet, a considerable portion of the 90 grains was burnt outside the muzzle. As to the shooting above mentioned, it could have been readily equalled by a double muzzleloading rifle which I formerly owned, weighing only 8½ pounds and carrying round bullets of 17 to the pound with 55 grains of powder. I once tried it carefully at 40 yards, sitting down and resting one elbow on each knee, six successive shots from right and left barrels alternately, were in such a small cluster that any one of them would have killed a sparrow.

I cannot help believing that there must have been some thing wrong either in the cartridges or the grooves of the two breechloaders, when the Ballard hit a 2½-inch disc only four times in seven shots, and the Sharp only five times in ten shots. The enormous weight of those rifles certainly increases their accuracy, and yet it would not be difficult to find plenty of English breechloading .45 express rifles not more than 9 pounds in weight, and loaded with 120 grains of powder, which would hit a disc of the above mentioned size eight or ten times in succession at 40 or 50 yards. The advertised targets, some apparently well authenticated, of the Ballard and other rifles, show that they shoot into rings of 3 or 4 inches in diameter at 200 yards. If the accuracy increase only in proportion to the diminution of distance (but it really increases much more), they would hit a ring 1 inch in diameter at 50 yards. The new rifle now being made for the British army, when fired at Enfield from a machine rest, put ten successive bullets into a square 5 inches wide by 9 inches deep at 500 yards. It weighs a little more than 9 pounds and carries a bullet of 385 grains with 85 grains of powder. The gauge is .40 and the grooves have one turn in 15 inches. Such shooting proves that there is nothing in the mere mechanism of breechloaders to prevent their fully equalling the accuracy of muzzleloaders.

With regard to the letter of Mr. Van Dyke, I will first say that there is no one for whose opinion upon sporting rifles I have a greater respect than that gentleman's.

I have read the chapters about them in the latter part of his work upon "Still-hunting" many times over, and think that every sportsman who uses a rifle ought to possess the book, even if it contained nothing else. It was, therefore, actually startling to see such an authority write that he "could bring plenty of muzzle loaders which, at 20 yards, would play upon a half-inch ring all day." Undoubtedly he could, and undoubtedly smoothbores of the same small gauge, with barrels of the same size, could be made to do precisely the same. Rifling is not required to keep a tightly fitting round bullet straight up to such a ridiculous distance. I know this from the performances of two smoothbores of my own, one a heavy 14-gauge, made expressly for ball shooting, and the other a 42-gauge, with barrels thick up to the muzzle like those of a rifle. The former, when fired from a rest, would almost invariably hit a mark the size of half a dollar at 40 yards, or at the most be within an inch of it. The latter, at 100 yards, used to put bullet after bullet through a page of note paper when loaded with 1¾ drams of powder or about 50 grains. The bullets weighed 43 to the pound, and fitted very tightly with a thin patch.

Some of the settlers in the Canadian backwoods use what are incorrectly called "smoothbore rifles," which carry round bullets of about 50 to the pound, and weigh 9 or 10 pounds—being sighted like rifles. The only time I saw one of them fired it hit the center of a small black spot marked on a tree 75 yards distant. This may have been a fluke, but a professional hunter, with whom I passed two months in the bush, said that he had used a weapon of the same kind for some time and could never discover any difference in accuracy between it and a grooved rifle, at the distances within which deer are usually killed.

All rifle shooting at such short ranges as 40 yards is delusive, and this the following fact, among others, will prove:

About eight years ago I had a .30-gauge single breechloading express built to order by a London gunmaker, who guaranteed in writing that it should put several successive shots into a 4-inch square at 150 yards. It was to weigh 6½ pounds, and carry hollow bullets of 150 grains with 50 grains of powder. When it was finished the maker wrote to me inclosing the target of six successive shots fired in his shotgun range at 40 yards. I forget the exact measurements, but the bullet holes were all in a cluster about the size of two postage stamps. I called upon the maker and told him that the shooting at 40 yards was no test of what a rifle could do at 100 or 150 yards.

He insisted that if it carried straight at the first-named distance, it would maintain the same proportionate accuracy at the longer ranges, and told me to try the weapon myself before paying for it. I fired it at 100 yards and could not, with the utmost care, make sure of hitting anything less than a square foot. The maker said that this must be in consequence of my bad aiming, and accompanied me on a second journey to the range in order to show what the weapon would do when held really straight. To his own stupefaction, when he fired from a fixed wooden rest at 100 yards, he failed to get the bullets into less than 18 inches square. After some alteration in the workshop, the rifle was so far improved as to hit a 4-inch square nearly every time at 100 yards, and I kept it, being on the point of sailing for India. I may remark, for the benefit of your readers, that it did not prove sufficiently powerful for dropping quickly any

but the smallest kinds of deer, and not even then unless hit in a vital spot. Two of my friends who had similar weapons came to the same conclusion after giving them an extensive trial, although during the first year they were very well pleased with the results of their shots. If I ever buy another rifle for deer stalking I intend to try a .40-gauge, the size recommended by "Nessmuk." I have used a .45 express rifle for several years, and am quite satisfied with their killing powers; but fancy that a weapon with rather less recoil might give finer off-hand shooting.

Mr. Van Dyke, in his remarks upon sights, evidently refers to those provided with small steps for altering the elevation. I have had three American rifles with sights of this kind, but do not like them nearly so well as those used upon English rifles, which have a fixed block for point blank range and folding leaves for every fifty yards beyond. This is the best possible arrangement for changing very quickly when in the presence of game, and the fore sight need never be raised to an imaginary number of inches above or below an animal's body, as is sometimes necessary with American sights.

I was glad to read, in FOREST AND STREAM of Oct. 1, a letter by "Nessmuk," in which he at last gives his idea of the best kind of rifle for deer shooting. I was anxious to know the result of his very long experience, having personally always used for large game (with the exception of the .36 express above mentioned) either round bullets not less than about an ounce in weight, or conicals of .45-gauge. I quite agree with "Nessmuk's" opinion that a double rifle is much better than a repeater for game shooting. It is more handy, and there is no weapon with which the second shot can be put in so quickly either to prevent a wounded animal escaping or to stop a dangerous one when charging.

American double rifles usually seem to be made, as "Nessmuk" describes, with the barrels arranged so that the bullets meet at from 30 to 50 yards from the muzzle. This answers practically very well, at least for all shots up to 100 yards; but I believe that it is better to fix them so that the bullets may remain at all ranges the same distance apart as when leaving the muzzle. It is then easy to acquire the habit of allowing half this width when aiming at small objects such as a grouse's neck, and at anything beyond 50 yards no allowance whatever is necessary. When the bullets cross each other their distance apart is constantly increasing, and it is most difficult to know how much to allow when making a long shot which requires great accuracy, such as at the center of a deer's neck when looking at the hunter over bushes 70 or 80 yards distant, or the center of an antelope's breast when facing the shooter at from 150 to 200 yards. Unfortunately very few double rifles even by good makers are really accurate. Usually at 100 yards the bullets will be found to cross each other from four to six inches, or throw the same distance apart, and the sights are very commonly arranged so as to divide the error between the barrels. I have always altered the sighting of my own double rifles so that the left barrel could be depended upon to throw its bullets without deviating to right or left, up to the longest distances at which they were accurate, and have used the right barrel as far as possible for the shorter ranges at which no allowance was necessary.

With the heavy barrels and small gauges used in America the recoil is so slight that there ought to be little difficulty in making double rifles to shoot well, even with varying charges; but with the lighter weapons and larger bores made in England, the shooting is changed with any alteration in either powder or lead, and it is often impossible to remedy this without producing some other defect. I once had a double two-grooved rifle weighing nine and a half pounds and carrying round belted bullets of thirteen to the pound. It was an extremely true weapon up to over 200 yards, but with only three drams of powder the bullets of the two barrels crossed each other about four inches at 100 yards. With three and one quarter drams they threw practically together, and with three and a half they struck a little apart.

I have now a 16-bore breechloader, made for naked spherical balls of 15 to pound, and very accurate up to 150 yards. Loaded with these and four drams of Curtis & Harvey's No. 6 powder, the two barrels throw into the same bullseye at 100 yards, but with the same charge of powder and patched bullets of sixteen to pound they form two groups of four to six inches in diameter, separated by an untouched space of four inches, the group of the right barrel being on the left side of the bullseye, and that of the left barrel on the right.

J. J. M.

LONDON, Nov. 30.

TALLAHASSEE GAME NOTES.

Editor Forest and Stream:

The following is a clipping from a city paper: Mr. Frank Hall, of Walkulla county, came in yesterday with twenty-five wild ducks, four wild turkeys, one deer and a big lot of fine bream as the result of a little hunting expedition of his on East River.

Also this: John Johnson, a Polk county hunter, carried the venison of nineteen deer into Bartow, last week, and sold it.

These items show the manner in which hunting is carried on in Florida by a certain class of hunters; and at this rate the depletion of the State of its present abundance of game will prove but a matter of a few years. Tourists and resident sportsmen hunt for sport; but a large number of the natives—countrymen generally or colored men—make it a business to bring game to the city, as in the above instances, merely for the money there is in it. Venison is fairly plentiful in this market at from 10 to 15 cents per pound, ducks from 15 to 25 cents, and quails and doves at correspondingly low rates.

The paper from which the items I have given were taken contained, a week or two ago, a paragraph similar to these, saying that a man from a neighboring county had just brought in a large quantity of game, from the sale of which he was going to pay his taxes. The "honest farmer" turns pot-hunter, and as the latter occupation is somewhat more agreeable and less laborious, he neglects the soil for the muzzleloader and the hounds with satisfactory results—to himself. Market-hunting and hunters may be necessary evils; but it is, in my opinion, being carried too far in this State. It is not even limited as to seasons, for I am told by those who speak authoritatively that the game laws are honored strictly in the breach, not in the observance, by those tempted to shoot out of season; and the few attempts made to convict offenders have proved futile, as far as I can learn. It is to be hoped that the new State Sportsmen's Association will take the cause in hand.

To one used to the winters of Michigan and Illinois, it is decidedly a novelty to find himself in a climate almost tropical, beneath a clear sky specked by summer clouds, and green trees and flowers flourishing luxuriantly around him; while a day's sport in fishing or hunting is to be had easily and comfortably. No fear of fingers too cold to pull a trigger, or a nose too cold to breathe through.

We have had several frosts, and cover and undergrowth have been killed off sufficiently to make shooting profitable, yet not too easy to be interesting. Little Bob White is "catching it," and many fine bags are made in which he figures prominently, while ducks of various sorts form no inconsiderable part thereof.

FOREST AND STREAM is doubly welcome in this corner of the country, where there is a dearth of news interesting to sportsmen; and its bright and readable pages are always scanned with pleasure and the profit of a well-spent evening.

BBE.

TALLAHASSEE, Fla., Dec. 24.

DEER IN THE ADIRONDACKS.

Editor Forest and Stream:

I can add to your reports on the enforcement of the anti-hounding law in the Adirondacks, that until the end of September no attention was paid to the law by any one who cared to violate it, in the region extending from the Upper Saranac Lake down the Raquette River and thence through to Blue Mountain Lake via the Tupper Lakes. I know that deer were run by hounds all through this country, Pliny Robbins's house on Little Tupper Lake being a leading headquarters for the offenders. Later in the season (so I am informed) the law received more attention, at least along the Raquette River and in the region of Big Tupper Lake and the Wolf Ponds, and fewer deer than usual were sent out of that country.

I am convinced that to enforce the new law in this part of the wilderness—and it is a very important part—a fund must be raised by individuals as was done last year in the Beaver Run country (described in your recent number). Three (and perhaps two) vigilant and honest detectives could cover the whole region about which I write, and so alarm hounders that the latter would not venture to put out their dogs. Could FOREST AND STREAM do a better work in enforcing the law than by undertaking to collect such a fund and to engage the necessary detective force? It might be easier to collect the money than to find just the men who should receive it; but I think that among well-known guides they could be found.

I will subscribe $5 toward such a fund and double it if necessary.

L.

NEW YORK, Dec. 23.

Editor Forest and Stream:

Now that the non-hounding deer law has had one year's trial, I am glad to read reports from various sections of the Adirondacks regarding its working and enforcement, and thus judge of what chance it has of becoming a permanent law, which necessitates being sustained by public opinion and winning over the guides to its support. I see nothing yet published from the south border of the woods. Game Protector Bradley of this district wishes me to say for him that he still adheres to the opinion he expressed in his last year's report, viz., the deer would surely increase if the old law was lived up to, and that the general sentiment of this section was in favor of hounding. The new law of course makes more work for him, and he thinks it inoperative without some amendments, as his annual report will show. I could give many interesting accounts of evasions and violations that he has discovered but was powerless to prosecute, but that would be anticipating his report, which would be unfair.

Personally I am in favor of no hounding, as are many of our club here. Some sportsmen here think that the new law gives those Pennsylvania gunners (we don't call market hunters sportsmen here) who have practiced all the arts of the still-hunter for many years past, an advantage over us here who have generally shot our deer while running before dogs, but a few years' practice would teach us their tricks, if they don't kill all the deer off in the meantime. It would be wise if each section around the woods would appoint a representative, all to meet at Albany this winter, and confer on the subject of proper amendments to the present law. Such amendments if presented to the Legislature by such a representation of practical sportsmen, would have great weight and be sure to be tried at least one season.

I think the Hon. R. U. Sherman, Secretary State Fish Commission, would attend such a meeting, and his practical knowledge would be a great help in straightening out the present inoperative laws. No day passes but what we hear of gross violations at present, and it is impossible for the game protector to investigate half of them.

The Little Falls man who has paraded himself in the newspapers lately as too virtuous a man to do what he has been charged with, will probably find evidence more than he dreams of, if he ever lets the case come to trial. But such cases as the ex-State official of Albany who, common rumor has it, hired five guides and their dogs to hunt what is known as the Oregon Section, pledging himself to stand between them and the law and relying on said guides' false oaths if arrested, probably will go clear, not only this time but in the future, unless we can get proper amendments to present laws.

I am pleased to report that we have succeeded in getting our board of supervisors to pass a law prohibiting market hunting, and we hope that the scores of barrels of birds which have every late year been shipped to market, will in future enrich our own tables.

I was one of four who spent four hours in a big swamp one day last week with one good dog. Just seven shots were fired and we brought home seven as nice rabbits as you could wish to see.

Every issue of your paper this fall has been very interesting to me, and I look forward to many pleasant reminiscences of the summer woods while reading it by my fireside this winter.

N.

JOHNSTOWN, N. Y., Dec. 21.

Editor Forest and Stream:

Agreeable to your request I learned as much as possible of the sentiment prevailing on the deer hounding law in St. Lawrence county. My knowledge is confined mainly to the territory at or adjacent to Cranberry Lake and some parts of the Grass and Oswegatchie rivers. The law, as far as could be learned, had been fairly well observed in that section, although there had been some violations. I learned of three occasions on which dogs were put after wounded deer, the game being secured in each case after a short chase. Once I understand a dog was wilfully put out; and some half dozen doubtful cases were reported, but nothing authentic was established. This was in the immediate vicinity of Cranberry Lake, but back some miles from the lake I am creditably informed most flagrant violations occurred, chiefly through the instrumentality of a gentleman from New York most eminent in his profession, but whose aim in the woods seems to be to slaughter the greatest number of deer possible by either filling them with buckshot on a runway or blowing their brains out in the water.

I have been myself, in years gone by, an unwilling eye-witness of his methods, and have know him to kill deer in August when his camp held five deer killed within two days, not a pound of which could be disposed of beyond that consumed by the gentleman, his companion, three guides and four dogs.

The guides almost to a man unite in saying that more deer are destroyed by jacking and buckshot than by dogs, but say that if both could be stopped there would be no trouble whatever in finding enough deer by daylight to keep any camp supplied, and what man is there with any sense of the sportsman in him that would not infinitely prefer placing a single ball in the right spot by daylight, to blazing away at thirty feet or less with buckshot at night, or braining the victim with gun or club in the middle of a pond or lake by day.

The majority of the natives, other than the guides, seem to approve the present law, and if the same feeling only prevailed elsewhere in the woods it would be but a few years hence before the Adirondacks would again teem with game.

During a two weeks' trip still-hunting on leaves and snow I killed three myself, and the rest of the party, my companion and our two guides, killed three more, but our game was well earned for it was all by hard work, and matching human skill and patience against their cunning and vigilance. Killed at this season of the year there was no danger of waste and we were fortunate enough to be able to bestow on our sportsmen friends at home a liberal allowance of our trophies.

During my tramps I was greatly surprised to note the scarcity of the ruffed grouse, for where in previous years I have flushed scores this year scarce one was to be found.

X.

SYRACUSE, N. Y.

Editor Forest and Stream:

Your favor of the 10th inst. is received. I am happy to be able to submit in reply information derived from my last year's experience in the capacity of game protector.

You are aware that my district comprises the counties of St. Lawrence and Franklin, and in answering your inquiries shall speak principally with reference to them.

In St. Lawrence county the sentiment against dogging deer is strong and more pronounced than ever. The use of dogs in the pursuit of deer has been less frequent there in the last year than ever before. It is still practiced in the more inaccessible parts, where fear of detection and punishment is little prevalent. The offenders are men without character, and, like the thief who steals from his neighbor's hen house, are willing to risk detection for the prospect of unlawful gain. When evidence can be secured to procure convictions, punishment is prompt to follow. Violators of the game law are treated like violators of other laws, because the feeling of the county, based on the judgment and appreciation of its best citizens, is not only radical in a law-abiding sentiment, but thoroughly appreciative of the great benefits to result from game protection.

In Franklin county absolute prohibition of hounding is treated as was partial prohibition under the former law, and as all other provisions of law for the protection of fish and game have been treated, that is to say is violated in the interest of personal greed, and to gratify reckless and wanton love of slaughter. This, so far as I am informed, has been the condition in that county within all memory. The consequence is that deer are so scarce there, particularly in the vicinity of the hotels, that the last resort, the dog, is employed to baffle every instinct of preservation and to overcome every difficulty in pursuit and capture. The hireling guide, in the employment of the mercenary hotel, uses every means suggested by his own cunning and by his unscrupulous "party" to capture the deer.

The example thus set and encouraged by the hotels is too generally followed by men who make pretension, at least, to respectability, but who are careful, so far as possible, to avoid detection by the meagre facilities the law provides for that purpose. Such men are, of course, hostile to the law, and their hostility is measured by the extent of its interference with their criminal practices. And here come in the "sacred rights" of the free-born American—the right of petition. They will petition for the repeal of the anti-hounding law, that is to say, will ask to be let alone in their wretched and inhuman practices. This, of course, will determine the consideration to be given them.

However, a correct sentiment is gaining ground in Franklin county. Many strenuous friends of the law there are unsparing in denunciation of the law-breakers, and in time they will make head against the mercenary interest at work exterminating their game. Exposing them continually, in and out of the county, will effect their purpose, for the doggers, when asked for a justification, stand dumb like criminals who have only to urge inclination. Sentiment in Franklin county favoring the anti-hounding law is decidedly on the increase.

In its working there can be no question but the law prohibiting dogging has saved large numbers of deer. Instead of the open and declared preparations and practices, we have now the secret and covert methods pursued by the doggers. With such efforts as the game protectors and game protectionists are able to make, the practice has been much abated. With continued efforts it will be suppressed, except as isolated cases shall occur beyond the reach of vigilance to prevent, and to be classed with other crimes that, to an extent, always have and always will baffle the best police.

In the last year I have recovered penalties as follows: In Clinton county, $50, for illegal fishing; in St. Lawrence county, two penalties for June killing in Franklin county and one penalty for June killing in St. Lawrence, and six penalties for illegal fishing in St. Lawrence. There are pending in Franklin county one criminal information for hounding, and in St. Lawrence six civil suits for hounding in Franklin, and three civil suits for illegal fishing in Franklin.

If this letter be not already too long, let me say that grievous outrages are perpetrated by the still-hunters under cover of moving venison in December. The privilege is availed of to kill continually in December to within the few days necessary to carry to market before close season commences, and this outrage is more secure of immunity than any other violation of the game law. The killing is done in the remote woods, without the possibility of detection. Can not the period for having in possession and handling be lim-

ited to five days after the open season? In practice five days do actually suffice for handling after killing is stopped.

The anti-hounding law is essential to the protection and preservation of deer. It makes protection possible, and so strengthens the purpose of game protectionists and insures desired results. Nothing can be more true than that with hounding permitted the results of protective effort are merely to save the deer from one set of enemies for the benefit of another, and the most deadly. If the dogs may be let loose to exterminate, what use in attempting to stay the lawlessness of other and comparatively harmless methods of hunting? It is but feeding the dogs—feeding the greed and cupidity of their lawless owners.

PETER R. LEONARD, Game Protector.

OGDENSBURG, N. Y., Dec. 14.

Editor Forest and Stream:

Yours to hand. I can say for the Fulton Chain guides and sportsmen that they have observed the law to a letter. They seemed to think it for their interest. It makes us discouraged to have a lot of pot-hunters come in and kill all our deer off in the fall and sell them for a mere nothing. It has been a most destructive season for deer, and more have been slaughtered than in many years before. One party on the Fulton Chain killed thirty-eight deer this fall and shipped them to market. They were from Pennsylvania, and there have been hundreds of deer killed by still-hunting this fall all over the woods, and mostly by pot-hunters from Pennsylvania. I think to save the deer we ought to have open season from Aug. 1 to Oct. 15, with the privilege of hunting with dogs. DICK CREGO.

BOONEVILLE, Dec. 15.

Editor Forest and Stream:

I only succeeded in the conviction of five men for the violation of the hounding law, all in this county. Four of them were fined $25 each and the other $50. The public sentiment here is so strong against this law that it is almost impossible to get any information from any source. Men who heretofore were always willing to give information and ready to assist in bringing violators to grief will do nothing now. Notwithstanding, I think the law has saved a great many deer in my district, and wherever I go the indications are that deer are very plenty. What hounding has been done was away from the settlements, and then very slyly. I have cases to come before the Essex county Grand Jury next week, but do not know how I shall succeed.

JOHN LIBERTY, Game and Fish Protector.

ELIZABETHTOWN, N. Y., Dec. 9.

Editor Forest and Stream:

Noticing an article going the rounds of the journals of the State in regard to the "Butchering of Deer" in the Adirondacks, I will give a few facts upon the subject. I am a sportsman and acquainted along the borders of the great New York wilderness, having visited the woods every year since boyhood.

One year ago last August, in company with a brother, I visited the Beaver River section, going in by the way of No. 4, and stopping at all of the principal lakes between this point and Smith's Lake, a distance of about sixty miles from home. I found the wilderness thronged with people from all parts of the country, and principally from the cities—legitimate sportsmen, as the guides term them (on account of their willingness to "shell out" their money to hotels, guides, etc.) I stopped a little while with Uncle Joe Dunbar, at Stillwater; found him overrun with boarders, and no accommodation for any one except his city sportsmen, but nevertheless I could not blame Uncle Joe, for sport is his hobby and cash his best friend.

The second day I stopped at Wood's Lake, a favorite deer resort up among the mountains, about six miles from Stillwater. Here I found a party of four men and plenty of good venison; and it was no place for tresspassers at that time. I traveled on in the direction of Little Rapids, a point on the river about twenty-six miles from Stillwater. Here I found an old acquaintance, Mr. Fred Crandall, a jovial, good-natured fellow and cunning hunter, pleasantly situated at Andrew Muncey's. After a brief visit I took one of their light-running canoes and journeyed on toward Albany Lake, a distance of four miles, and everywhere we found the wilderness alive with hunters, and concluded that we had come a long way and that we would bring up in some remote spot not thronged by sports. Found a few wild deer at old Albany, but concluded that they were too cunning for us, and after paddling my brother faithfully for one night I started in the morning for Thayer's Lake and thence to Big Rock Lake, a beautiful sheet of water about one and one-half miles in length, surrounded by dense forests and lofty mountains, and equalled in grandeur by few lakes in the great wilderness. Here we found rest for a weary hunter, with abundance of game and plenty of shots at fine deer, and stayed two or three days, pretty well satisfied with a short sojourn in the forest.

The present season, in company with a brother sportsman I visited the same lake, but how great the change. At the old lake, where one year before I could drive out deer by the dozens, not one remained to be seen or heard. I inquired into the cause and found out that one of the so-called manly guides had visited the lake in company with his party of sports and slaughtered twenty fine deer last fall during the hounding season, and also my informant killed six or seven, making in all about twenty seven deer in one short hounding season on the same lake during the season of 1884.

These are facts and can be proven very quickly by the writer, who can give the parties' names who slaughtered them in this instance if necessary, and likewise on Albany and Smith's lakes where the lithe and beautiful creatures were driven far and near by hounds during that fall. And still these sporting men try to make it appear in their lengthy articles that the cause of the scarcity of deer is owing to a band of Pennsylvania pot-hunters, who they say are encroaching upon public and private hunting grounds and constructing "salt licks" in the woods and therefore have killed a great many in this way.

The salt-licks in question are by no means a new device in the woods, as they have been in constant use for years. The writer can point out a salt spring in this locality where deer were killed fifty years ago by the pioneer hunters; and also numerous salt-licks that have been in constant use by hunters for generations. I will admit that there have been more still-hunters in the woods the present fall than there have been for years, but we are informed by these very men that there have been but a few deer killed compared with the numbers killed by hounding in former years. The general complaint is that it has been a poor year for "city sports;" and why is it? Simply because the month of August is the poorest month in the year for "floating," as no deer of any account will water in the lakes during this month; and then the law deprives them of their old-time sport of hounding, and the sporting man, in order to still-hunt, must shoulder his gun, act the part of a frontiersman by tramping through an unbroken forest from early morn till dark, and sometimes for days in this way, with but little or no luck; and is it anything strange that they do complain of a poor year for venison?

They tell us that public and private detectives should be sent into the woods to apprehend the law breakers, or otherwise in a year or two all game will be exterminated beyond recall. Don't worry; the law is good enough as it is; and as long as we can keep the dogs out of the Adirondacks, we will have abundance of deer, and then all sporting men will thank the Legislature of 1884 for its wisdom in passing the non-hounding law. GEORGE V. NORTON.

GLENDALE, Lewis County, N. Y.

The following paragraph has been extensively copied:

"Last Thursday a telephone dispatch from West Leyden informed Louis Shankenbury of this village that a load of deer was being taken through that place to Rome, and as the season for shipping deer was closed Game Protector Brinckerhoff, who was at Rome, was informed of the fact. He kept a lookout for the venison venders but obtained no clue to their whereabouts. Friday the deer arrived in Rome and the *Sentinel* furnished the following facts about their arrival and shipment: 'Friday morning Philip Haynes, of Otter Lake, Lewis county, twenty miles from Glendale, came to Rome with the carcasses of eleven deer—five bucks and six does—and a pair of saddles of venison. Mr. Haynes is a guide during the summer season, having a house and living at Otter Lake. He said he shot the deer still-hunting, within the past three weeks, and that none were shot after Dec. 1. He asked twelve and a half cents a pound for the saddles, and a trifle less for the whole carcasses. Some of the deer were sold here and the others shipped to New York and Syracuse. The load of deer attracted considerable attention on the street. One old sportsman said to a reporter: 'You see the result of the new law forbidding the running of deer with dogs and allowing a long season of still-hunting and floating. You couldn't kill as many deer as there are in that wagon by hunting all the season with dogs. I am in favor of allowing the running of deer with dogs until the month of October and closing the season then. In that way pot-hunters, like this man, would be shut out.' Mr. Haynes being asked if he was a pot-hunter, smiled and said, 'I s'pose that's what these city sportsmen call me.'"

The "old sportsman" is either a myth or an idiot. As a matter of fact the hounding season under the old law would have closed Nov. 18, and under that law the still-hunting season would have been just as long as it is now. The killing of these deer by still-hunting in what has been for years the still-hunting season has no bearing whatever on the hounding law, unless we may reason that had dogging been allowed this year these deer might have been killed long before they were. And why all this pother about a dozen deer, when season after season scores of deer have been hauled out of the North Woods by dogging parties from neighboring towns? Why was no "old sportsman" found to raise his protest then? And why all this hypocritical talk about the season being too long? It is all intended to mislead respecting the present law, which is the best one ever on the statute books, and is going to stay there.

WASHINGTON, D. C., Dec. 26, 1885.—Quail shooting has been only fair this season in the neighborhood of Washington, and great complaint is made of the dark skinned nimrods and their altered muskets, as being the main cause of the scarcity of birds. It is not generally known that within a very short distance of the capital of the nation—eight miles as the goose flies—there exists a flock of wild turkeys. The primeval forests about Falls Church in Virginia are the stamping grounds of these birds, and three of them have been killed this season by three different hunters. Sundry persons who have seen the flock estimate that it contains about thirty turkeys, led by a giant gobbler. Wildfowl are quite scarce on the upper Potomac. Your correspondent saw a fine flock of swan on the way to Mount Vernon. Nothing but a Winchester, however, could reach them. There is some talk of a dog show in Washington this winter, and a movement on the part of the Baltimore Kennel Club to hold one at the capital—where such displays have always paid—is contemplated. We think it a good plan. It is about time the Baltimore Kennel Club gave a show. Quite a number of gadwall ducks—a rare bird east of the Alleghenys—have been shot near Washington this fall, the marketmen invariably call them female redheads. Hanging up in the markets of the capital I saw numerous woodpeckers, jays and other insectivorous birds for sale, mostly at the stalls of the negro countrymen. Can these birds be purchased for the table, or are they shot for ornamental purposes? It seems a shame that such should be allowed within the shadow of the Smithsonian Institute.—HOMO.

PENNSYLVANIA THREE YEARS' QUAIL LAW.—Williamsport, Pa., Dec. 21, 1885.—*Editor Forest and Stream:* In regard to prohibiting the shooting of quail in Pennsylvania for three years, I most heartily agree with "Homo," and feel confident that there is not one sportsman in this city who would not favor such a move. By all means let there be a three years' quail law. Four or five years ago quail were quite plenty in this section, but to-day I know of but three or four small coveys within a radius of ten miles from Williamsport, two of which I planted two years ago, and now have some which I will put out in the spring. Rabbits and grouse are plenty, it being no unusual sight to see forty or fifty rabbits hanging in front of a market stall on market days (Wednesday and Saturday). Red and gray foxes are also plenty, and the owner of a good foxhound need not want for sport in this section.—REDE. [All that Pennsylvania needs in this respect is enforcement of the present law, which is good enough.]

PROPOSED LONG ISLAND GAME CLUB.—An advertisement in another column proposes the formation of a new game and fishing club for Long Island. This region is so easy of access that it seems strange that its desirability for this purpose was not long ago seen and taken advantage of. It was in the case of the Southside Club at Islip, and the splendid success which this organization has made of its preserves shows what can be done on the island by judicious management. We have little doubt that at some time in the not very distant future Long Island will be as great a shooting and fishing ground as it ever was.

SHOOTING AT GEESE AND SWANS WITH RIFLE.—Easton, Md., Dec. 14.—*Editor Forest and Stream:* Having occasional chances for shots at large wildfowl from the shore with a rifle, I write to the various rifle experts, through the columns of your valuable paper, for information as to the best caliber of rifle and ammunition (as to weight of powder and lead) to be used for above purpose; also, as to what sights are best adapted. The distance to be shot over is seldom less than 300 yards and running up to, say, 1,000 yards. Wildfowl, especially swan, will often allow the shooter to try several shots, so that he has a chance of a sighting shot or two to regulate the sights. I am, of course, speaking of sitting shots on the water. Any information gentlemen interested in rifle shooting can give me will be duly appreciated by—SINKBOAT.

HAVRE DE GRACE.—Washington, D. C.—I learned at Havre de Grace on the 23d inst., that the ice which had made on the flats some two weeks since having now broken up, had driven the ducks south when the feeding places closed up, and the fowl had not returned nor are likely to until their northern migration in the spring. No fowl can be found now at Havre de Grace or at the Gunpowder or Bush rivers, the great bulk of them being in the North Carolina sounds. The town of Havre de Grace, which depends almost entirely upon its near fowl shooting, is to-day a very dull and unhappy one. Canvasbacks shot some time since are bringing $7 per pair at the town.—HOMO.

LONG ISLAND GAME PROTECTOR.—A correspondent writes: "Would you be kind enough to use your influence in favor of Gilbert A. Penny, of Good Ground, for State game protector? He is just the man for the business, and lives in just the place where protection is needed the most. It is too bad the way birds are netted and fire-lighted and shot on their feeding grounds nights in this bay. Howell, who is opposed to Penny, does not know anything about the duties of a game protector, and lives ten miles away from the bays, and would not be interested as much as Penny."

GALVESTON, Tex., Dec. 19.—The weather has been unusually warm here, and duck shooting has been on the decline and has not proved to be as good as I thought it would. The ducks have all left us again and have gone further East. Two or three days ago I saw a flock of geese going east as fast as their wings could carry them. They all seem to be going east. The snipe have all left us, also the plover; and as for poor Bob White, he has been thoroughly cleaned out from this place, thanks to pot-hunters and no game laws.—REDBREAST.

DEATH OF BENJAMIN TATHAM.—Benjamin Tatham died Dec. 25, at his home in this city, in his seventieth year. He was the head of the firm of Tatham & Brothers, the shot manufacturers at 82 Beekman street, and in Philadelphia. The other members of the firm are Charles B., George N., Henry B., and William P. Tatham. Mr. Tatham was a prominent and active member of the Society of Friends and was identified with many benevolent enterprises, to which he gave valuable aid in the shape of money, advice and personal work.

INDIANA.—Fairland, Dec. 23.—We have had a nice fall for field sports. Quail are somewhat more plentiful than for a few seasons past—gradually recovering from the effects of the great freezeout of 1879. Hares not so numerous. Indeed the boys complain very much of their scarcity. The trouble is that too many were killed last winter during the long continuance of the snow.—C. W. W.

VICKSBURG, Miss., Dec. 23.—The shooting season is a little late with us, caused by low water in the Mississippi. We have some mallards in the swamp and a few teal, but not as yet in paying quantities.—P.

COOKING WOODCHUCK.—Springfield, Mass., Dec. 19.—"Chuck Hunter's" article read with interest. Will "Chuck Hunter" or some other hunter give some good receipts for cooking the game?.—WOODCHUCK.

Sea and River Fishing.

TROUT FISHING IN NEW BRUNSWICK.

STARTING from my home on a July day I arrive at my destination, which is a little town called Richibucto, N. B., in a little over two days. Having been there twice before, I of course know most of the streams where the trout were to be found. Having rested from my journey, I made ready to start for a place called Peter's Pond, which is about four miles from where I was stopping. When I arrive at the pond I find the Indian whom I had engaged all ready, awaiting me with his birch bark. It takes but a short time to rig the rod, and stepping into the canoe we start. The Indian, with that noiseless dip which only a native understands, shoots the canoe forward as if propelled by unseen hands. Arriving at the locality, I reel out my line and make a cast which bears no fruit. From the next I get a rise which terminates in my favor, and land a beauty about three-quarters of a pound. From that time onward I have some excellent sport, and catching enough for a good supper, start home tired but happy.

Of all the times I have fished on Peter's Pond I have never yet experienced what is called fisherman's luck. The next day I start for Teedie's Brook, which is said to be the best stream in the province; and surely it deserves the name. It runs for about a mile through a meadow, where the smaller trout are to be found. Following the stream along one gradually enters a scene which he instinctively knows is trouty. On either side the alders overhang the stream, under whose shade the gamy trout disport themselves.

Wading down it, with the water waist deep, I drop my flies in pool and rill and at last reach a place which looks promising for big trout. Casting my line

> "Beneath a time-scarred oak whose leafy boughs
> Still in its age when summer sun beats down,"

I have a rise which makes the water churn. The tail fly has hooked a trout which to my eager eyes looks like a young whale. I assure you I only see him for a short time when away he goes and then commences that inevitable fight which

is sure to take place when one has hooked a big one. I tried in vain to stop him, but finding it useless, of course, do the other thing, and that is go with him. He stops after a few minutes, which seem hours, and sulks. Then away he goes again trying all manner of devices to get the hook out of his mouth. In this way he worries himself out and begins to show the signs that foreruns the death of all trout. Now he is almost within reach of my net, now he darts away as though inspired with a new life, but it is only momentary, and at last is in the fatal meshes of the landing net, a place where all good trout should die.

That day by me and my friend there were one hundred and some trout killed, forty of which weighed one hundred pounds, and thinking some of my friends in B. would not believe it I sent them to an acquaintance who keeps the largest sporting goods store in that place. When I arrived I went to see him, and he told me that he and his clerks had all they could eat of them and if I had not sent them would hardly have believed I caught such big ones on a six-ounce rod. I will say that any one understanding trout fishing can do almost as well. The reason I say "almost" is because the natives around there informed me that my fish for that season were surpassed by none. Any one going to Richibucto can get board from $5 a week upward.

The striped bass fishing is excellent, and snipe and duck shooting fine in season. I have seen but very few woodcock, but was told there were quite a number. Hoping that I may have the pleasure of meeting some of the correspondents of FOREST AND STREAM up there next summer I close.

W. B. S.

SING SING, N. Y.

THE NEW YORK FISH COMMISSION.

Editor Forest and Stream:

In my communication in relation to the protest of the Anglers' Association of the St. Lawrence River against the further continuance in office of Commissioner Blackford, which appeared in your issue of Dec. 17, a brief reference was made to the several acts creating and continuing the Commission. As it is believed that the Governor and his constitutional adviser, the Attorney-General, are inclined to concur in the view taken by this Association, viz., that the term of office of the Commissioners is five years, and that the Governor has the power to appoint their successors, it may be well to refer to these acts somewhat more critically. The following quotations contain all that has any bearing on the question at issue:

Laws of 1868, Chapter 285, entitled "An Act to appoint Commissioners of Fisheries for the State of New York." Section 1. A Commission of Fisheries for the State of New York is hereby established. Section 2 prescribes the duties of the Commissioners. Section 3. Horatio Seymour, Seth Green and Robert B. Roosevelt are appointed under this act to hold office for two years.

Laws of 1870, Chapter 567, amending the above act. Section 2. All vacancies occurring in said Commission shall be filled by the Governor of the State, and the term of office is hereby extended three years. * * *

Laws of 1873, Chapter 74, entitled "An Act to continue the Fishery Commission of the State of New York." Section 1. The Fishery Commission of the State of New York, created by act passed April 22, 1868, Laws of 1868, Chapter 285, is continued with the powers conferred upon them by the said act. * * *

Laws of 1869, Chapter 309. Section 2. The Governor is authorized to appoint a resident of the counties of either Kings, Queens or Suffolk an additional member of the Commission of Fisheries of the State of New York, and to supply his place should a vacancy occur therein, as provided in chapter 567, laws of 1870.

These acts are all grouped together in 3d R. S., 7th ed., pp. 2,113-5.

The only acts limiting the tenure of office are the first two, passed in 1868 and 1870.

But if these constituted all there is on the subject, then there is no Fishery Commission. It expired by limitation at the end of five years.

If it did not, why was it necessary for the Legislature to pass an act in 1873 in order to continue the Commission?

To get at the exact status of the Commissioners to-day, these acts must all be taken together and then the intention of the Legislature becomes very clear.

1. It proposed to name the Commissioners, and not leave it to the Governor to do so.

2. It intended at first to create a Commission for two years only.

3. In 1870 it intended to continue the Commission till 1873, and made provision for filling vacancies, but not for appointing successors, for there could be none. The Commission was then to terminate.

4. In 1873 it determined upon an indefinite continuance of the Commission, and so enacted, but again made no provision for appointing successors, for again there could be none.

The Commissioners then in office were recognized and instructed as to their duties. And they were to hold "during the pleasure" of the Legislature, which was the appointing power. "Every office of which the duration is not prescribed by the Constitution, or shall not be declared by law, shall be held during the pleasure of the authority making the appointment." 1 Rev. Statutes, 7th ed., p. 365, § 8.

5. The only power it conferred upon the Governor was to fill vacancies, but a vacancy can only occur during a term. The statute on that subject is as follows: "Every office shall become vacant on the happening of either of the following events: (1) The death of the incumbent, (2) his resignation, (3) his removal from office, (4) the ceasing to be an inhabitant of the State, etc., (5) his conviction of crime, (6) his refusal or neglect to qualify, etc., (7) a decision declaring his appointment or election void." 1 Rev. Statutes, 7th ed., p. 370, § 74.

If therefore the Commissioners are holding over after the expiration of their term, there is certainly no "vacancy," and that view is fully sustained by the courts.

It is difficult to see how any other construction than that suggested above can be put upon the acts in question. That is, the Legislature at first limited the life of the Commissioner to two, and then extended it to five years.

That it afterward continued it indefinitely, *i. e.*, during the life of its members or during its own pleasure, with power to the Governor to keep it alive by filling vacancies. And this is the view commonly entertained.

The Governor is an accomplished lawyer, and it is to be hoped that before acting he will personally examine the laws in question, and rely solely upon his own judgment as to the powers they confer upon him

ANGLER.

A NEW YEAR FISHING TRIP.

THE first day of January, 1877, found me in what is now Aiken county, Minnesota. At that time Fort Ripley was a well garrisoned frontier fort and Crow Wing, some eight or ten miles above on the Mississippi River, an advanced trading post, the licensed traders being the brothers McDonald, well known frontier characters. I had gone up from Dubuque with a surveyor who had a government contract to sub-divide a lot of townships in a tract that had just been purchased from the Chippewas. As I knew a few words of "Ojibwa," picked up in the Bad Ax country the winter before, and none of the rest of the party, six in number, knew one word, I had a big "bulge" on them and passed for an "interpreter." But such interpreting! One of the party noticed that my replies were often "gowin gandun" (I don't know how to spell it but that is the way it sounds) and he finally found out that this meant, "I don't understand," and he lost faith in the whole business. We had gone up early in October and had worked off to the eastward from Crow Wing toward the Mille Lacs, found some men stealing Government timber on the Anoka River, who, outnumbering our little party, antedated "Boss" Tweed's inquiry of—what are you going to do about it?" and as this was really no part of our business we did nothing. Lakes were plenty but we did not camp by them long enough to attempt fishing. The tent was usually in a frozen swamp where we had to dig for water, often impregnated with iron so strong as to discolor the camp kettles, or on the edge of a cranberry marsh where hundreds of acres of fine berries were waiting a harvester. Of fish we saw plenty. Every Indian wigwam had fish drying beside it. These were mainly pickerel, *Esox*, and lake trout, *S. namaycush*. I did not see a brook trout in that region, although they might have been plenty, but the Indians cured only the larger fish. These were on a platform of poles laid in crotches about ten feet high, and were dried, or partially so.

On several occasions I had exchanged "pequishigan" (bread) for "kenosha" (pike or pickerel) and it was an agreeable change from our staples of beans, pork and corned beef, but McBride, our compassman, always spleened against anything that an Indian had handled and wouldn't eat a fish of their curing unless he could wash it for half an hour before it was cooked. Henry Neville and I took turns, week about, one hunting for game and the other keeping camp, in a country overrun with hungry Indians who bought moccasins of buffalo skin, very poor they are, because deer were so scarce. I came into camp on the last evening in December with one coon, the result of three days' hunt and two nights' sleeping out. The boys "hefted" it and pronounced it fat and good enough for a New Year dinner. Crosby asked me if the death of the coon did not weigh on my conscience because it was so long since I had killed anything. Tom Davies suspected that the animal had died of old age. Pierre Gibbs tried to make out that it had been killed with an arrow instead of a bullet, although he knew that every adult redskin in that region used a gun of some kind. The fact of fresh coon outweighed all attempts at controversy as to the cause of its death and we sat down to our evening dinner of bean-soup, hot biscuit and boiled pork with the prospect of a feast on the morrow, for the last fresh meat was now only a remembrance, a venison ham, ten days in the background of memory. Between two spoonfuls of hot bean soup McBride said to me, "You are a fisherman but you never get us any fresh fish. You loaf through the woods with a gun and seldom kill anything while we are in a country where we find a lake every few miles and all the fish we get is from the hand of some dirty Indian.' That this charge was true I will at this late day confess, but at the time its very truth nettled me. I said: "Let Henry Neville stay in camp with me to-morrow and we will try a small lake some four miles north of the head of the Anoka and see if we can't get a fresh fish for dinner. I saw the lake yesterday while following a deer track which led to a deserted yard, and old Yellow foot who has hung about the camp for the last week, told me "Kigee Kenosha* pungee gumee," which means that—there are big pickerel in the little lake." Henry made answer and said: "I will go with thee."

The morning dawned bright and beautiful, the boys ate their breakfast and went out "on the line." Old Yellow-foot lounged into camp as the last axeman left. Henry cleaned up while I hunted up such tackle as we had and found a braided silk line but not a hook, the hooks had been lost somehow. Henry had some wire and we made half a hundred hooks, but whether they were the regular "Limerick," "sneck," "Pennell" or "Kirby" is impossible to say at this late day. They were simply fish hooks, and we could say of them as Macbeth did to the murderers:

> "Ay in the catalogue ye go for men,
> As hounds, greyhounds, mongrels, spaniels, curs,
> Shoughs, water-rugs, and demi-wolves are cleped
> All by the name of dogs."

So our hooks, though made of wire, were "hooks" and much better than those illustrated in Dame Juliana Berners' "Boke of Saint Albans" or by Leonard Mascall. Old Yellow-foot was to accompany us, in fact it would have been impossible to have given him a "cold shake" as long as there was anything to eat in the camp, and while we shouldered our tackle and provisions he took an implement which it pleased him to call "au-gau-quet" instead of the simple word axe and we moved on to the frozen lake. The old duffer did know where the springs came in and where we could get minnows for bait, and we supplied ourselves with them in good quantity and then proceeded to cut holes in the ice and set our lines.

As has been recorded, the day was fair, but the ice was thick. We cut and baited about twenty holes, lunching and smoking at intervals, and then went up in a ravine to have a grand lunch while the fish took hold. Old Yellow-foot never missed a chance at the fodder and encouraged us with hopes of "kingee kenosha," and we laid off until near sundown, when we went to the holes and lifted the lines with what adhered to them and started for camp.

The sun was just sinking as we entered camp and the boys were gathered about the kettle of festive beans when Crosby hailed us: "Halloo Nitchie,* what luck?"

"Not a durned fish," answered Neville, "but we've got all our bait left."

FRED MATHER.

*Here I would call the attention of etymologists to the derivation of the word "mascalonge" and its variations. My spelling of the Ojibwa name of pike, *Kenosha*, is entirely phonetic. I have no idea how it might be spelled. Give the o a nasal sound and twist it into "Kinoje" and it is not a far cry to "maskinoje" which most authorities try to twist into a French derivation with "mask" as a synonym of "face." I do not pretend to decide this matter for I am not learned enough in either French or Ojibwa, and know the latter tongue has received many additions since the "Chemokman" came among them. As an instance of this: A poor Indian had begged around camp for some days with more or less success, when one morning he came in and requested "pungee pegushigun." To my untrained ear this meant "pungee" (little) "puquishigan" (bread) and I told him "gowin pequishigan" (no bread); he insisted, and taking up a gun showed me that "pegushigun" meant percussion caps for a gun, and not bread—showing that he had made a word, or others had, for something new.

*Friend.

A SOCIAL ANGLING CLUB.

WE have just read a four page report of the annual dinner of the Fly-Fishers' Club of London in the *Fishing Gazette*, and have been struck by the fact that there is no association of this kind in America. There are angling clubs in plenty, but they usually own or lease waters and live for angling alone. The Fly-Fishers' Club does not live for fishing but for social purposes only, to meet at the rooms, look through the library, chat, smoke, talk of fishing and fishing tackle, and to have an annual dinner. These in themselves are a sufficient reason for its existence. It numbers 264 members, and up to December 5, last, had a balance in the bank of nearly $1,800. English anglers have long known that "it is not all of fishing to fish," and social clubs composed of anglers are not at all uncommon in that country. There is room for just such an organization here in New York and it could be made very popular if the right men could take hold of it.

English publishers claim that the bulk of their more expensive angling works come to America which, if true, shows that we have a large class who are interested in angling beyond the pleasure derived from actual fishing.

At the late dinner referred to Hon. Sir Ford North presided, and Mr. Wm. Senior (the well known "Red Spinner" and Mr. R. B. Marston, of the *Fishing Gazette*, were vice-chairmen. Over one hundred and fifty members were present and the reported speeches were capital. Among other things the president said: "Of late years one had heard a great deal about the fishermen of America. He confessed if any one had told him ten years ago that American fishermen deserved the name, he should have laughed at them. But either one's ideas got opened or Americans had come forward in the way which was not expected. At any rate, there was no doubt now that there were persons in America who, if they had not gone into fishing questions very thoroughly and deeply, at any rate had done a great deal toward contributing to the perfection of the tackle which was now used. In addition to that they had written some most excellent books. He need only mention one which he was sure many of them knew, though it had only recently been published. He meant a book on fly-fishing and tackle, of which Mr. Wells was the author. We knew now that there were many gentlemen in America who were first-rate authorities on the subject. When gentlemen, eminent in science or literature, came to this country, they were, upon introduction to the Athenæum Club, made honorary members for a certain time, which placed them on precisely the same footing as its ordinary members. He thought the model set there was one which, if they got on a little bit in the world, it would be very desirable for them to follow. (Hear, hear.) He should be very glad if they found the Fly-Fishers' Club was one to which American gentlemen who were fond of the pursuit might, when recommended, become members during their stay in this country. He was sure they would appreciate the opportunity they would have of seeing the angling works of England collected together better than most of them would have an opportunity of seeing in their own country, and it would also be a great satisfaction to know that they would have an opportunity of making the acquaintances and offering hospitality to such gentlemen. He hoped very much that as they got on a little bit and got established on a good footing, they might be in a position to have communion of that sort with the anglers of another country who spoke their own language, at no expense to themselves, but greatly to their benefit and pleasure."

Mr. R. B. Marston, whom we believe was the originator of the club, referred to the fact that both his father and his son were members of it, and he felt proud of it. "He would not go into the history of the club, but would simply congratulate the members who were present at their first dinner that they had survived the fearful crush on that occasion. The chairman had referred to one subject which he should like to mention before he read the report as to the state of the club—viz., the question of publishing angling books. That was a thing which he thought the club should never attempt—particularly those with colored plates—the expense was so great. (Hear, hear.) The other suggestion, that they should have a book in which anglers from all parts of the country could place their flies, so that all could see the kind of flies used in certain districts, would be most valuable, and would be obtained at no expense whatever. The chairman had referred to the question of honorary and foreign members; but he might say they had some honorary members already. They had his friend, Mr. F. Mather, one of the best anglers and most genial fellows in the world, and if he came over from America, he was sure they would give him a hearty welcome. Then they had Mr. Harris, and Mr. Wells, the author of "Fly-Fishing in American Waters." They had also Mr. Cheney, and one or two other American gentlemen. On the Continent, there was Herr Max v. d. Borne, one of the best pisciculturists in the world, who had done much for fly-fishing, and who would be ready to do all he could for any of their members who went to Germany. Then there was Herr Emil Weeger, an Austrian gentleman, who would be most happy to make any friends welcome in Austria, and show them the best fishing there."

We have only quoted parts of the speeches which related to this country, as space forbids our giving all the good things which were reported. The Rod and Reel Association at present exists merely to hold tournaments but might be made the basis of such an organization as we have named. The Ichthyophagous Club is entirely social but it has no organization and its membership consists merely of those who, getting invitations, pay for a dinner ticket, and it is doubtful how long before the possibilities of the water to furnish new forms of horrible creatures for their delectation will be exhausted. We would suggest to the members of the Rod and Reel Association the advisability of their extending their organization in the direction named.

HABITS OF BLUEFISH AND TOMCODS.—A member of the Jersey City Heights Gun Club writes: "Will you kindly advise me the name of the best book in which I could learn of the habits of fish in American waters, especially those of bluefish and tomcods? I should like to settle a dispute about the manner of living of above named fish." Something on the habits of bluefish may be learned from "The

American Angler's Book," by Norris; "Fishing in American Waters," Scott; Reports of the U. S. Fish Commission, 1872–82. In none of these is the tomcod treated of at any length. In De Kay's "Fishes of New York," 1842, both species are described. If we knew just what points our correspondent wished to investigate, it is possible that we might enlighten him.

RAINBOW TROUT IN MARKET.—These fish are now plenty in Fulton Market, where they may be bought either alive or dead. The South Side Club, of Long Island, has recently sent a large number of fish from one-quarter to three-quarters of a pound to Mr. Blackford. The demand for them is not great so far, as the public has not been accustomed to buying trout at this time of year. The laws of New York permit their capture and sale at this season, although many of the fish look as if they would spawn in a few weeks.

THE CONNECTICUT COMMISSION.

WE have the twentieth report of the Fish Commissioners of Connecticut to the General Assembly at its January session, 1886. As the fiscal year of the State was changed by the last Legislature, so that it now ends on June 30 instead of on November 30, as formerly, the report only embraces the seven months beginning Dec. 1, 1884, and ending with last June. During that time the Commissioners have hatched and planted 5,733,000 shad, and 450,000 young trout. In addition to these they have hatched 100,000 salmon eggs which were presented to the State by Prof. S. F. Baird, U. S. Fish Commissioner, and placed the fry in the Farmington River. From the same source they also received 30,000 Michigan trout eggs, the fry from which were planted in the streams of Hartford county.

In the Connecticut River the catch of shad in 1885 was 190,300 fish, being an increase of 40,255 over the previous year. In the Housatonic River the catch in 1885 was 50,689 fish, a decrease of 1,311 from 1884, though the number of seines and gill nets had increased. In the hatching of shad the Commission has abandoned floating boxes and substituted the jars. Mr. Henry J. Fenton, Supt. of Hatcheries writes on this subject to the Commissioners as follows:

"Gentlemen—I herewith submit my report of shad-hatching operations on the Housatonic River at Birmingham, Conn., for the year 1885. I completed the new shad-hatching house, as per orders, the 15th of May, in the dry canal of the Ousatonic Water Company, who kindly gave me the privilege to erect the building there, and use of all the water necessary to conduct the hatching, by putting a pipe through their head-gate into the pond, which made a most desirable location to operate the McDonald shad-hatching jars. The jars arrived from Washington, D. C., in good condition, in time to commence taking spawn the 18th af May, and I continued taking them until the 16th day of June. The jars worked to my entire satisfaction, and with the most satisfactory results; the loss of eggs being a mere trifle, scarcely two per cent., while, by the old method, the loss was from five to fifteen per cent. The number of eggs taken each day, and the fish planted will be seen by the written report, all of which is respectfully submitted."

On the subject of river pollutions the report quotes from the New Haven *Palladium* on "Poison in the Housatonic," which says: "A large lot of chemicals used at the Wilkinson paper mills in Shelton was emptied into the Houstonic River on Thursday, and soon many fish floated on the water. Men and boys seemed to go crazy with excitement at seeing so many fish at their mercy. Boats were procured and soon the river was alive with men and boys, some in a state of nudity, gathering large shad and other fish that had not life enough in them to escape their pursuers. Several hundred fish must have been thus caught, although who would want to eat them is a mystery, and spectators standing on the bridge saw many float down the river, whose waters were discolored with the acids far below the rink. If the water was so poisonous to the large fish what must it have been to the millions of young shad that has been hatched and emptied into the river the past season."

Again the same paper says: "The slaughter of fish took place yesterday. The paper mill emptied its refuse into the river and the chemicals in solution immediately filled the water with dead fish. Large bass, pickerel, shad, and others went floating down. Parties in boats secured large numbers. From three to four times a year chemicals are dumped and all fish in the track are killed."

In the matter of fishways the report says: "No further action has been taken in reference to the building of fishways. A recent letter from Col. McDonald states that the work of constructing fishways over the Great Falls of the Potomac is progressing, and will probably be completed this year. It is hoped that this may solve the great problem of passing shad through fishways, and the result will be watched with the greatest interest."

An appendix gives several laws relating to the fisheries among which we note the following: No person shall sell, exchange, or offer to sell any dead brook trout less than six inches in length, penalty not more than seven dollars. No person shall, between sunset and sunrise, steal, or attempt to steal, fish from any pond, weir, or net; penalty not to exceed $100, or imprisonment not more than sixty days, or by both fine and imprisonment.

POINTS WORTH CONSIDERING.

1. Because of the compact style of its typography the FOREST AND STREAM actually contains, weekly, more reading matter pertaining to its chosen field than is found in any similar publication in the world.

2. In general excellence the reading columns of the FOREST AND STREAM are of a higher grade than those of any similar publication the world.

3. Taking into account the amount and the character of weekly reading given, the FOREST AND STREAM is away ahead of any similar publication in the world.

4. If a sportsman wishes a sportsman's paper, he will be better suited by the FOREST AND STREAM than by any similar publication in the world.

HOMEOPATHY FOR HORSES.—An article has been going the rounds of the papers, which states with some particularity that a horse being severely diseased and having been given up to die by two celebrated "old school" veterinary doctors, was speedily cured by being put into the hands of a homeopathic veterinary, and this is cited as being something of a wonder. We are at a loss to know where these wise men could have lived for the last twenty years, that such a fact could be news to them. It is now twenty odd years since Humphreys' Homeopathic Veterinary Specifics have been in use, and tens of thousands of stables are using them exclusively, with just such success as is heralded in that paragraph, and the fact is well settled that horses, cattle, sheep, dogs and hogs are as readily cured by the "Veterinary Specifics" as babies and children by the doctor's "Family Specifics." Not only are liverymen, horse railroad, express and coach companies using them, but cavalry officers of the United States Army have endorsed and recommended them, and the man who made the miraculous cure described above has used them for many years with the marked success above related.—*Adv.*

FIXTURES.

BENCH SHOWS.

Jan. 5 to 12.—First annual exhibition and dog show of the Central Indiana Poultry and Pet Stock Association, at Indianapolis. J. W. Elliott, Secretary.

Jan. 19, 20 and 21, 1886.—Annual Exhibition and Beneh Show of the French Creek Valley Poultry and Pet Stock Association. A. L. Braden, Secretary.

Jan. 26, 27, 28, 29 and 30.—Fourth annual dog show of the Southern Massachusetts Poultry Association, at Fall River, Mass. R. G. Mosher, Secretary.

Feb. 8, 9 and 10.—Fourth annual exhibition of the New York Fanciers' Club, at Madison Square Garden, New York. Chas. Harker, Secretary, 62 Cortlandt street.

March 16, 17, 18 and 19, 1886.—Western Pennsylvania Poultry Society's Dog Show, at Pittsburgh, Pa. C. B. Elben, Secretary.

March 23, 24 and 25, 1886.—First Annual Dog Show of the New Jersey Kennel and Field Trials Club, Newark, N. J. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

March 30 to April 2, 1886.—Third Annual Dog Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Edward A. Moseley, Secretary, Boston, Mass.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **3092.**

EVOLUTION OF THE MASTIFF'S HEAD.

WE print this week, as a special supplement to the FOREST AND STREAM, views of six mastiff heads, three of the type of twenty years ago and three of recent date. A comparison of the three heads on the upper line with those below them will show the great change which has been brought about by selection and careful breeding in these dogs. While these illustrations are of especial interest to breeders of the mastiff, they are scarcely less so to those who are interested in other breeds, for they indicate very forcibly what changes can be made in a type in any given direction, and further, that such changes can be brought about in a comparatively short space of time. A similar series appeared a short time ago in the *American Kennel Register*, and we are indebted to that journal for the loan of the material from which the present illustrations have been made. Very happily timed is the article on the mastiff from the pen of Mr. C. H. Mason, which appears in another column.

GRAPHIC'S ALLEGED FLUSH.

TO the public and all fair-minded sportsmen who love a good dog for the pleasure he can derive from his ownership, we will say, we decline to discuss through the columns of FOREST AND STREAM or any other paper any question affecting dogs, field trials or bench shows with any professional dog dealer or handler. We, however, value the good opinion of all honest men no matter what their vocation, and that the latter may know the truth, make the following statement:

1. Neither of us saw Graphic make any flush on Friday afternoon, nor did we see any birds except larks get up anywhere near the dog.

2. Upon careful inquiry made Friday night and Saturday morning we could find no one else who saw any flush.

3. We did find many who saw the whole heat Friday afternoon and who were positive no flush was made.

4. Mr. Heath took especial pains Friday night to ascertain through proper inquiries whether a flush had been scored against Graphic, and was informed that the flush had been so scored, and on Mr. Coster's testimony alone, the other two judges not having seen it.

5. Not satisfied with this information and as a further precaution, we sought out Mr. Wilson Saturday morning, and saw scored on his judges' book the flush against Graphic and heard the statement that he (Mr. Wilson) did not himself see the flush.

6. The notice of withdrawal was properly directed and handed to Mr. Coster, the secretary of the club.

7. No opportunity was given Mr. Heath to discuss officially why said flush was so scored.

8. Mr. Anthony rode beside Mr. Coster as he had a right to do as the representative and deputy of Mr. Heath, and at the latter's request, besides which Mr. Anthony sold Graphic to Mr. Heath subject to all his (Mr. Anthony's) rights in the running—the dog was entered in his name and consequently he had the privilege in any event to be with the judges and follow the dog.

9. Both Mr. Coster and Mr. Anthony were over seventy-five yards in the rear of the other two judges, and in fact Mr. Coster did not appear to be judging at all, and had not Graphic been brought back by his handler (after quartering out the whole ground in front of Beaufort on the right) and thrown across the ditch to the left, he (Mr. Coster) would have been more than one hundred yards to the rear of the dogs.

10. The statement "that Messrs. Donner and Coster owed their appointment as judges to the unanimous voice of owners and handlers who were present," is false. Neither of us were consulted as to Mr. Coster's appointment as judge in the pointer stake. We did not agree to Mr. Donner, but on the mistaken idea, so far as Mr. Anthony was concerned, that he was not a member of the Westminster Kennel Club. Mr. Wilson, though we had no voice in his selection, was perfectly satisfactory.

Mitchell, our handler, though having more dogs entered than any other handler, was not consulted at all. He had four out of eighteen starters in the All-Aged Pointer Stake, four out of thirteen in the Derby, and one in the All-Aged Setter Stake.

We will add that we will match Graphic (against any dog in his class living) on the bench, whether owned in Europe or America, "the acknowledged best pointer living" not excepted, for the championship of the world.

Also a dog and bitch, his progeny, against any small-sized dog or large-sized bitch the progeny of any stud dog now owned in the United States.

Also a brace, his progeny, against any brace now owned in the United States. These contests to take place during the month of May, 1886, in the city of New York, the judging to be by points according to Stonehenge, and a record of the points given each dog to be made and published by the judge or judges as the basis of the several awards.

Also, in the field:

1. Against Mainspring, the winner of the All-Aged Pointer Stake E. F. T. C., 1885, for an all-day's race, to be run either at High Point or Salisbury, N. C., at any time, as may be agreed during the second week in March, 1886. Capt. McMurdo to handle Mainspring and Mitchell to handle Graphic.

2. Also against both Croxteth and Drake (respectively the winners of the All-Aged Pointer Stake 1883 and 1884), the races to be run all one day and during the week prior to the race with Mainspring, and with an interval of three days between each race. Thurtle and Mitchell to handle.

3. Mr. B. F. Wilson, of Pittsburgh, to be the sole judge, and retrieving not to be counted.

We make this offer not in any offensive sense. Nor have we singled out Mainspring as one of the contestants for any other reason than he was the winner of the All-Aged Stake this year, having directly or indirectly beaten every dog in the stake, except Graphic or Spot, the latter being the winner up to his withdrawal and having won his third series. Also because Mainspring is a descendant of Mike Romp, a strain claimed to be superior in the field to any other strain of pointers living.

If Graphic or his progeny are fairly beaten in either or all the contests, as they may be, we shall not be found wanting either in good nature or generous praise for the owner, breeder or handler of the opposing dog or dogs.

The acceptance of any of the above challenges to be made in writing to the undersigned, and directed to No. 44 New street, New York city, on or before Feb. 1, 1886.

CHAS. HEATH,
JAS. L. ANTHONY.

THE ENGLISH MASTIFF.

Editor Forest and Stream:

It was not without a pang of regret that I put aside the December number of the *American Kennel Register*, which contained the last of Mr. Wynn's able and instructive articles on the origin and history of the English mastiff. This last contribution to what may be termed canine literature has not been excelled; in my opinion it is the best essay on the subject that has ever been written. Each important statement is indorsed either by documentary evidence or common sense argument, and the author appears to have been just in his allusions to rival breeders. True, there are one or two sharp hits at certain persons whose names I need not mention; but there is nothing of an offensive nature in any one of the articles, all of which are chock full of rich information. Like every man whose efforts, no matter in what sphere of life, have been crowned with success, Mr. Wynn has made enemies, and plenty of them; but he can afford to let minnows swim around him and take an occasional nibble at his coat tails if doing so affords them either pleasure or amusement.

The first time I met Mr. Wynn was in the judges' ring at the Chesterfield show about six years ago. We had a dog each in the same class and the judges, Messrs. Hodson and Mellor (both parsons), were not long in sifting the wheat from the chaff. When the rubbish had been cleared out I found myself standing by Mr. Wynn and his dog—Scalford King was his name I think—Creole was my entry. This was about the time when a great noise was being raised about level teeth, and Mr. Hodson had made a big blunder in ordering out of the ring all the undershot specimens at a certain show. His wayward nephew, Vero Shaw, who always carried about with him a cartload of stupid ideas and very few good ones that were not borrowed, followed suit and was promoting his views in the usual *ipse dixit* fashion when Messrs. Hanbury and Wynn shouldered the not very gigantic task of cooling him off. Shaw alludes to this matter in his "Book of the Dog" as follows: "Mr. Hodson, who had most properly turned out of the ring all the cow-hocked and undershot specimens, remarked that he was convinced good mastiffs were to be had without these defects, and he was determined not to be a party to the awarding of prizes to dogs so malformed. Subsequent events have proved the soundness of his decision." It is scarcely necessary to say that subsequent events have proved nothing of the sort. "Stonehenge," in his last volume, says: "A slight projection of the lower teeth may be overlooked, and good judges continue in awarding prizes to undershot specimens." Shaw's motto was *humanum est errare*, and he was a wretched judge of dogs. I once saw a dog that was led into the ring by an attendant ordered out by Shaw for being "worthless." The owner of this dog and myself put up a joke for Shaw, and sent the dog into the ring again, with another man at the end of the chain. To cut a long story short, he gave the dog the prize, and, to make matters worse, told the owner it was a very good specimen. This took place at the Darlington show. Almost precisely the same thing has been done here by an individual who still believes himself to be a judge. But more of this anon.

Creole, as mastiff men know, had a level set of teeth, and that is one reason why I felt sure she would beat Mr. Wynn's dog, who was undershot. Mr. Hodson stepped over to where Creole was and examined her mouth, then it was King's turn. Mr. Wynn bared the dog's teeth, and in the coolest manner possible looked straight into Mr. Hodson's face and said, "He isn't sufficiently underhung for my fancy." That was a facer for the judge who would "not be a party to the awarding of prizes to dogs so malformed," and it was one for me when I saw the blue ribbon handed to Mr. Wynn. A protest would have been in order, but profound respect for the black cloth controlled me and nothing was said. Mr. Wynn had been previously represented to me as a great "kicker"—a selfish chap that could not see anything good about anybody's dogs but his own. My informant was evidently mistaken, as I met Mr. Wynn twice after the Chesterfield show, and beat him on each occasion. If he "kicked," I never felt the blows, but there remain pleasant recollections of a charming conversation that was not ended until we saw before us visions of very strange things. Some of these loomed up from Devonshire, and I distinctly remember a Lyme Hall mastiff, the sire and dam of which had been seen going into the ark; huge bundles of photographs taken on Mount Ararat; an ancient leather bag made from the hide of Balaam's ass; an immense pair of gig lamps, stronger in magnifying qualities than any I had ever seen, and—a hat. I shall never forget this last-named relic of antediluvian days. It was the only real hat I had ever seen, and I have never seen one since. Many futile attempts have been made by mastiff men to ascertain the dimensions of that hat; they remain unknown to all but the maker and owner. We know that it was large enough to cover, and that it did cover, a whole kingdom; but we know no more. Can Mr. Watson, who was in England not long ago, or Mr. Wade, who has had a steamship full of correspondence with mastiff breeders, give the history of that hat? I doubt it.

Perhaps now that Mr. Wynn has completed his unequalled essay on the history of the mastiff, he will describe the successful stud and exhibition dogs of the present day. Such a contribution, emanating from such a source, would be not only interesting to all mastiff breeders in this country, but would be very instructive and invaluable for reference.

The *American Kennel Register* of November turned out an excellent illustration of mastiff heads, but being crowded with entries of newly registered dogs, there was left no available space for an article. This is to be regretted, the more so because the editor is a popular judge and an excellent critic. In the absence of editorial comment I feel tempted to have my say about one or two of these heads, which appear to have been very carefully selected with a view of showing the marked improvement that has taken place within the last twenty years.

The *entente cordiale* existing between myself and many of the readers of your kennel columns is sufficient guarantee that my motive will not be misconstrued. All of us have not had equal facilities for gaining information, and certainly Americans have had limited opportunities of adding to their knowledge of non-sporting dogs. But no matter how scanty our experience, we should strive to help one another, and we can do so to some extent by friendly discussions in the better class of papers, and by frowning down all that is unsportsmanlike and unmanly. Mastiff interests have suffered se-

EVOLUTION OF THE MASTIFF'S HEAD.

[SUPPLEMENT TO THE FOREST AND STREAM.]

verely during the crisis through which dog shows have been passing, but there need be no fears for the future. Dr. Perry, Mr. Wade, the Winlawn Kennels and others are hard at work, and may succeed in breeding good specimens. See what these men have had to face and you will cease wondering why America has never produced a first-class specimen.

The back numbers of FOREST AND STREAM contain a grand and everlasting monument to the ignorance—not prejudice—of certain persons whose career ended with Mr. Lincoln's death. One or two illustrations will suffice to show how perplexed must have been those breeders who had no fixed ideas. At one of the New York shows Gurch (second prize) beat Salisbury (third prize); I paid $1,000 for the latter and sold the former for something less than $200. Grim (first prize) was perhaps worth $10 to some people, I would not have given $5 for him. Take Ilford Cromwell—his dog was not worth a card at some shows and his owner could not dispose of him until Dr. Perry made a bid of $50, which was accepted. Mr. Wade had to do a lot of talking before the Doctor could be induced to pay $50 for such a brute. Mr. Wade was the only man that could see $50 in such a "funny looking dog." At New Haven I had the pleasure of awarding him first prize and special prize for the best mastiff in the show, and all of a sudden people began to see something good in him. Mr. Dalziel at once recognized his good qualities, and went as far as saying he was one of the best brindle mastiffs he had ever seen. If you should make an offer of $500 for Cromwell it would be refused, and you could buy the $600 Hero II. for less money than the $50 "funny looking dog." Prussian Princess, one of the best bitches ever seen in this country, and a winner at the best English shows, was described in a Western paper as being something worse than a mongrel, and Homer, who is about the best home bred specimen we have, was said to be a worthless cur. The result of all this was that Dr. Perry withdrew his dogs and will not exhibit them again until all chances of their being mangled have vanished, I don't know, but I am told the names of Watson, Dudley and Exley are not entered in his black book. I state these facts merely to show that if mastiff breeders have made slow progress, they are not so much to blame as some persons might suppose.

Now for the *American Kennel Register's* illustrations. Duchess, said to be Hanbury's, is first on the list. She was whelped in 1860 and was by Bill George's Tiger out of Empress, by Ansdell's Leo. She won several prizes, two of which were first prizes, at Birmingham, and at the Islington show, 1864, she beat Governor. Although I have seen this bitch I do not remember her, but I have an idea that her head was much shorter than is shown in the pictures I have seen of her. Mr. Wynn says she had a short muzzle, but the *Register's* illustration, also photographs I have seen, show her to have had a round head, heavy ears, and a long light muzzle. Nichols's Duchess had a head of the latter type—too houndy and long and lacking in width of muzzle. The illustration answers equally well the purpose for which it was made, whether it be a likeness of Hanbury's bitch or Nichols's.

Governor, bred by Mr. Lukey, was whelped 1861, and was by Garnier's Lion out of Lukey's Countess. He took third prize at Islington 1862, second prize 1863, and third prize 1864. The *Register's* illustration shows him to have been faulty in head, ears and in muzzle. He may have been a big, truly-formed dog, but every picture I have seen of him gives him a wretched head. Not having seen him I must be careful lest I should do him injustice.

Turk, bred by Miss Aglionby, was whelped 1867 and was by Field's King out of Miss Aglionby's Hilda. He won innumerable prizes and was well known to all showgoers. Mr. Robinson, his owner, also owned Punch, and the two dogs were well worked during the show season. Turk's most formidable opponent was Lion, owned by Miss Hales, of Canterbury. Turk and Punch were better in head properties than Lion, but the latter was a better built dog than either of his opponents, and it is a pity he had such a faulty head; it was much too long and houndy in appearance and his ears were large and heavy. None of the pictures I have seen of Turk do him justice, and the illustrations are better, as a rule, than the photographs. True, his head was not equal to the head of a Wolsey; but it was a good mastiff head, and he was neither round in skull, snipy in muzzle, or lacking in wrinkles. All pictures deprive him of the kindly expression and dignified bearing that were his. Punch was offered to me for £30. He was a long-legged, cow-hocked specimen, and I never liked him. The last time I saw these dogs was at the Halifax show, 1871. Turk took first prize and Punch second prize. Lion was lame, and was put back on that account.

Colonel was whelped 1875 and was by Col. Mellor's Ben out of Parkinson's Jeannette, by Exley's Victor. He won prizes at almost every show throughout England, and the first time I saw him was at Birmingham, 1876, where he took second prize in the open class, The Shah taking first. I came very near being the owner of Colonel, and was just on the point of purchasing him when Mr. Alston of Sale stepped in and outbid me. He was not a big dog, but he was a good one. True, his feet were not of the best, and that he was light of bone, and had a way of standing with the near fore foot twisted out, that did not add to his beauty. In other respects he was a truly formed dog and was at all times a hard one to beat. He had good head, fair girth of skull and was much above the average in muzzle. His ears might have been smaller, but they were as black as indigo and his mask was exceptionally good. Although his keeper, George Stables, swore he was "the best blooming mastiff in the world," I held another opinion and much preferred Wolsey. This magnificent son of Rajah was the grandest specimen I have ever seen. True, he was not so strong in loin or so good in eyes as Colonel, but he showed far more character and had a much grander head. Colonel and I are old friends, and I have many a time left a comfortable first class to pay him a visit in the luggage van. (Steam cars and baggage are not known in old England.) When I passed down the benches at a dog show on a tour of inspection he was on his legs the moment he saw me. A shake of the paw did not satisfy him, he must lick my face as well. The latter privilege I seldom allowed.

Ben, the sire of Colonel, was a big heavy-boned dog, fairly put together, but his head was very deficient. I never saw his dam Jeannette, but suppose she was a much better specimen than Ben, and her sire Victor, owned by Mr. Exley of our town, was a very useful dog. Victor begot Bosco, a very grand young dog; he took second prize at Bradford, 1880, when he was about fourteen months old, and I bought him just after the show; £100 was the price paid for him, but I did not keep him more than a few days, as Mr. Royle of Manchester, now well known as a very successful exhibitor, never let me have any rest until I sold the dog to him. He made me an offer of £200, and at that price Bosco changed hands. In my opinion it was a very low price for such a dog. A few days after this, Mr. Royle sent him on to the Darlington show, and it cost him his life. After taking first prize in a good class, he contracted a severe cold and died within twenty-four hours from inflammation of the lungs.

Elaine, by Crown Prince out of Lady Rowena, was whelped 1883, and has taken premier honors at the best English shows. I have not seen this bitch, but pictures show her to be a grand specimen, very good in head properties. If we compare this bitch's head with that of Duchess, we must allow that mastiff breeders have not been idle. The dogs might be of different breeds so marked is the difference.

Pontiff, a good-headed son of Old Rajah and Princess, was whelped 1879. He had won several first prizes in good company, and at the best shows; he beat Nero (Miss Hesketh's) at the Alexandra Palace, 1881. I have not seen Pontiff, but his pictures give him a grand head, but rather big and heavy ears. His mask and ears are not dark enough. Nero (Miss Hesketh's) was a much better dog than Beaufoy's Nero. The latter I never liked. He was a big well built dog, but his head and tail were too much for me. Miss Hesketh's Nero had a grand front, and was especially good in muzzle. Compare Pontiff's head with Governor's, and we have another illustration of what brains and perseverance can accomplish.

CHAS. H. MASON.

BAY RIDGE, L. I., Dec. 28, 1885.

PACIFIC COAST FIELD TRIALS.

Editor Forest and Stream:

The third annual field trials of the Pacific Coast Field Trials Club were begun here on Tuesday, the 15th instant. The first day's efforts were rather discouraging, as but few birds were found, although they were plentiful in this neighborhood a few weeks ago, when the committee inspected the ground. But one heat was run on the first day, and that was between Barney's Tom Pinch and Henry Bassford's Solano B. The youngsters were worked for four hours without the judges being able to come to any conclusion, and the conclusion of the heat was postponed until the following day.

On Wednesday it rained, and the low chemisal was so wet that no work was attempted. The Derby was, however, concluded on Thursday, the dogs being worked on new ground, where birds were found in goodly numbers, but quite wild.

The Derby winners were J. M. Barney's Tom Pinch, Henry Bassford's Solano B., and George W. Bassford's Victor II.

The winner of first is a handsome, stylish, lemon ticked dog, twenty months old, by Tom (Sensation—Colburn's Belle) out of Beulah (Flake—Lily). He was presented by John A. Wise, of Virginia, to Mr. Barney.

The winner of second is a liver and white dog, eighteen months old, by Glen (Ranger Boy—Beautiful Queen) out of Josie Bow (King Bow—Josie).

The winner of third is a lemon and white dog, litter brother of Solano B.

The All-Aged Stake was begun to-day, and W. Schreiber's lemon and white pointer Mountain Boy (Grouse—Nell) beat J. M. Bassford's liver and white pointer bitch Mountain Queen (Ranger—Queen).

POINT REYES, Marin County, Cal., Dec. 17.

In the All-Aged Stake the first prize went to William Schreiber's lemon and white pointer dog Mountain Boy (Grouse—Nell); second to J. M. Bassford Jr.'s lemon and white pointer dog Lemmie B. (Prince Ranger—Gracie); third money was equally divided between J. G. Edwards' black, white and tan English setter dog, Royal Duke II. (Regent—Dolly); J. M. Bassford Jr.'s liver and white pointer bitch Beautiful Queen (Ranger—Queen), and C. N. Post's black, white and tan English setter bitch Janet (Count Noble—Dashing Novice). The judges in the Puppy Stake were C. N. Post, J. G. Edwards and H. H. Briggs. In the All-Aged Stake the judges were Payne J. Shafter, J. Martin Barney and H. H. Briggs.

The trials were not a very decided success. The grounds proved bad, the birds were scarce and wild, the weather stormy. EXPERTUS.

SACRAMENTO, Dec. 22.

NEW YORK DOG POUND.—It is rumored that the dog pound in this city may be reopened at this season and the dog catchers put to work. To such a pretty pass have things come when the public officials can be influenced in this fashion by sensation mongering newspapers. Instead of muzzling the dogs it would be a good plan to muzzle the editors who are creating all the hydrophobia scare there is. Meanwhile, owners of valuable dogs will do well to guard them from the official executives of the foolish city government.

OBO III.—Saco, Me., Dec. 22.—*Editor Forest and Stream:* I have been informed that Dr. Chapman, of New Haven, Conn., has just claimed the name Obo III. for his spaniel in the *American Kennel Register*, and I write this to inform you that my dog has a prior claim to the name, as he was registered in the *A. K. R.* last January, and the name claimed and the sale reported in FOREST AND STREAM of Jan. 8, 1885. His number is 1981. He is a valuable dog and I object to any one else claiming the name.—MRS. R. L. BOWERS.

IMPORTATIONS.—Arthur Wallack, of New York, has received from England the St. Bernard dog Courage II. (Oscar II., K.C.S.B. 12,856—Snowdon, K.C.S.B. 9,390), four years. Jas. L. Anthony, of New York, and Chas. Heath, of Newark, have purchased the pointer Bracket (Graphic—Bloomo), bred by E. C. Norrish, and winner of first at Birmingham last November.

NEWARK BENCH SHOW.—It is reported that the New Jersey Kennel and Field Trial Club have selected as judges of the March Newark show: Pointers and setters, J. H. Whitehouse, Teply Court, Worcestershire, Eng.; St. Bernards and other large breeds, J. H. Dudley, Camden, N. J.; small dogs, J. F. Kirk, Toronto, Canada; spaniels, A. C. Wilmerding, Bergen Point, N. J.

KENNEL MANAGEMENT.

☞ No Notice Taken of Anonymous Correspondents.

V. P. C., Cooperstown, N. Y.—I have a beagle puppy seven months old, while out in the woods to exercise he was taken with a spell of barking and howling which lasted about half an hour, and then would run about in a very uneasy manner. On the way home pup got a great fright from a dog and at intervals of a few moments would continue to bark and howl. After getting home the puppy was very uneasy and I became afraid of him, running about and howling every few moments. This was last Friday, since I have given him a dose of castor oil, also a dose of castor oil and buckthorn and white poppy. He appears better, does not howl more than three or four times a day, but is very uneasy at times, while at others he will play about and appear quite like himself. I noticed he is inclined to bite or chew his hips once in a while. Have noticed no worms in stools. Ans. Your dog will probably come around all right with very little treatment. The fits are produced probably from stoppage or constipation aided by too much meat in food. Do not feed raw meat, and if your dog is very fat give him less food. If castor oil and buckthorn do not operate freely, give him eight grains of calomel at night. If dog is no better report again.

P. H., West Winsted, Conn.—My young Laverack dog, ten months old, is ailing. Just noticed it yesterday morning; eyes very red; gets up and constantly on move; coughs a trifle this morning; eyes discharge water and a little matter; appears sick at stomach and vomits some bones, grass, etc.; groans when lying down and breathes very hard and short and is shivering nearly all the time; nose is quite cool and moist; pulse quite rapid; bowels in good shape of yellow color; never has been troubled with worms or seen any pass from him. Ans.—Your dog has the distemper. Give four drops of tincture of aconite root every hour until the fever abates. Give a pill of 10 grains of quinine at once. Keep the dog in a warm, dry, sunshiny room, and change the bedding twice a week. Feed with fluid diet, beef soup without fat, milk with lime water, gruel and porridge. If you see no improvement, report again to us.

J. F. R., Grand Rapids, Mich.—My three dogs have some kind of rheumatism. They keep jerking one, and sometimes both, forelegs when lying down or standing up, and cry fearfully. Ans.—Your dogs suffer from severe nervous disturbance. On what it depends it would be hard to tell you from your meagre description of symptoms. Eliminate worms by carefully watching discharges and by keeping the bowels free. See that the food is wholesome. Give plenty of exercise. For medicine give ten drops of the tincture of nux vomica morning and evening in a little sweetened water or mixed with the food.

KENNEL NOTES.

KENNEL NOTE BLANKS.—For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." All Kennel Notes must be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

☞ Notes must be sent on the Prepared Blanks.

Ringwood II. By John Ingham, Westerly, R. I., for white, black and tan beagle dog, whelped Dec. 10, 1883, by Ringwood (Lord de Freyne's Ranter—Earl of Lewe's Beauty) out of Thorn (Victor—imported Lucy).

Sousie. By Will G. Simons, Manchester, N. H., for red Irish setter bitch, whelped May 10, 1885, by champion Elcho, Jr., (champion Elcho—champion Noreen) out of Ruby (champion Berkley—Sirene).

Nellie Grey. By Western Reserve Mastiff Kennels, Palmyra, O., for light fawn mastiff bitch, whelped Sept. 26, 1885, by Cæsar (A.K.R. 12) out of Oma (A.K.R. 201).

Kingdomcome. By Elm Grove Kennels, South Norwalk, Conn., for liver and white ticked pointer dog, whelped July 7, 1885, by Duke Royal (A.K.R. 2472) out of Gala Day (A.K.R. 2634).

Daisy Robin. By Clifton Kennels, Jersey City, N. J., for lemon and white pointer bitch, whelped July 22, 1885, by champion Robin Adair (A.K.R. 2030) out of champion Daisy Bravo (A.K.R. 562).

Finn II. By John Kelley, Newburyport, Mass., for brindle and white bull terrier bitch, whelped July 8, 1884, by Jack (Dixie—Fauchon) out of Fan (Crib—Gipsy).

Rush IV. By E. P. Sweet, Providence, R. I., for lemon and white pointer dog, whelped May 30, 1885, by Rush III. (A.K.R. 402) out of Flirt (A.K.R. 1248).

Telie Doe. By Geo. W. Dixon, Worcester, Mass., for pug bitch, whelped Sept. 6, 1885, by imported Tuck out of Toodles (A.K.R. 2147).

Ringwood's Belle. By L. W. Laing, White Cloud, Mich., for white, black and tan beagle bitch, whelped April 28, 1885, by Ringwood (Ranter—Beauty) out of Collette (Chanter—Beauty).

Mikado. By Herbert Flint, Haverhill, Mass., for black cocker spaniel dog, whelped Aug. 30, 1885, by Obo II. (A.K.R. 432) out of Althea (A.K.R. 842).

Cappell G., Caleb G., Cornelia G., Cleola G., Clotilda G., Christiana G. and Candace G. By L. Shuster, Jr., Philadelphia, Pa., for black, white and tan English setters, two dogs and five bitches, whelped Aug. 16, 1885, by Gladstone (Dan—Petrel) out of Cornelia (A.K.R. 950).

Bessie. By J. Satterthwaite, Jenkintown, Pa., for black, white and tan beagle bitch, whelped Feb. 17, 1884, by Racket (Rally—Louise) out of Fly (A.K.R. 1012).

Dot. By J. Satterthwaite, Jenkintown, Pa., for black, white and tan beagle bitch, whelped March 24, 1885, by imported Kino out of Fly (A.K.R. 1012).

Ned B. By J. A. Rockwood, West Medford, Mass., for black, white and tan English setter dog, whelped Aug. 22, 1884, by Foreman (Dashing Monarch—Fairy II.) out of Pet Berwyn (Dashing Berwyn—May Druid).

Alert, Anslem and Annette. By Shaw & Bates, Clinton, Mass., for mastiffs, two dogs and one bitch, whelped Sept. 6, 1885, by Agrippa (A.K.R. 449) out of Antea (A.K.R. 200).

Fanny Gordon. By E. V. Hale, Cleveland, O., for black and tan Gordon setter bitch, whelped June 5, 1885, by Argus out of Dora.

Mountain Harry. By E. V. Hale, Cleveland, O., for harrier dog, whelped Oct. 3, 1885, by Sankey out of June.

Nellie Bow. By E. V. Hale, Cleveland, O., for liver and white pointer bitch, whelped July 5, 1885, by Jacob out of Lady Bow.

Clotilda. By W. T. Reynolds, Poughkeepsie, N. Y., for black cocker spaniel bitch, whelped April, 1885, by Obo II. (A.K.R. 432) out of Hornell Ruby (A.K.R. 67).

Blanche. By F. B. Tirrell, Weymouth, Mass., for liver Irish water spaniel bitch, whelped Feb. 15, 1885, by Barney S. (Larry—Floaty II.) out of Maggie B. (Neptune—Daisy).

Tina. By J. A. Rockwood, West Medford, Mass., for blue belton English setter bitch, whelped May 22, 1885, by Dashing Berwyn (Dash II.—Countess Bear) out of Dryad (Druid—Nilson).

Foreman's Boy. By D. A. Goodwin, Jr., Newburyport, Mass., for black and white English setter dog, whelped June 5, 1885, by Foreman (Dashing Monarch—Fairy II.) out of Jolly Nell (Prince—Jolly May)

Judy. By H. B. Brackett, Littleton, N. H., for bull-terrier bitch, whelped June 20, 1885, by Snap (Old Paddy—Molly) out of Bettina (Cubb—Sic).

Vida. By Albert B. Wilson, Roslyn, N. Y., for St. Bernard bitch, whelped Nov 20, 1887, by Og out of Magog.

Lendime. By Albert B. Wilson, Roslyn, N. Y., for blue ticked English setter bitch, whelped Oct. 23, 1884, by Glen (Frank—Dio) out of Frisk (Joe—Dy).

Emperor. By C. T. Brownell, for black and tan Gordon setter dog, whelped August, 1885, by Ben Butler (Flash—Chloe) out of Jennie (Cute—Bessie).

Dude. By C. T. Brownell, for fawn body, black points, pug dog, whelped May, 1885, by Dandy (Dandy—Judy) out of Judy (Max—Nell).

Nana. By C. W. Willard, Westerly, R. I., for white, black and tan beagle bitch, whelped Aug. 23, 1885, by Little Duke out of Gypsey Queen.

Zephyr. By C. W. Willard, Westerly, R. I., for white, black and tan beagle bitch, whelped Aug. 23, 1885, by Little Duke out of Gypsey Queen.

Cyclone. By C. W. Willard, Westerly, R. I., for white, black and tan beagle dog, whelped Aug. 23, 1885, by Little Duke out of Gypsey Queen.

Jake. By A. H. Spicer, Westerly, R. I., for white, black and tan beagle dog, whelped Aug. 23, 1885, by Little Duke out of Gypsey Queen.

Frank P., William P. and Noble P. By J. J. Prentiss, Chicago, Ill., for two black and white and one black, white and tan English setter dogs, whelped Aug. 9, 1885, by Paul Gladstone (Gladstone—Lavalette) out of his Jessica (Count Noble—Nellie).

Bessie P., Daisy P., Flossie P., Juno P. and Nellie P. By J. J. Prentiss, Chicago, Ill., for two chestnut, white and tan, one chestnut and white, one white and tan, and one black and white English setter bitches, whelped Aug. 9, 1885, by Paul Gladstone (Gladstone—Lavalette) out of his Jessica (Count Noble—Nellie).

Fancy. By Scott Frye, Bath, Me., for liver and white cocker spaniel bitch, whelped May 23, 1885, by Rex (Diamond—Quand) out of Edith (Brush II.—Olivia).

Leo. By Fred M. Brasher, New York, for red Irish setter dog, whelped Dec. 10, 1884, by Chief (Berkley—Duck) out of Moth (Larry—Jessie).

Don. By Fred M. Brasher, New York, for black and white spotted coach dog, whelped Jan. 6, 1883, by Dick (Spot—Kittie) out of Nellie (Rover—Dot).

Woody Crest Kennels. By C. N. Boyd, Woody Crest, Jerome avenue, New York city.

Belmont Hunt. By Chas. F. Oat, West Chester, Pa., for his kennels of foxhounds and beagles.

BRED.

☞ Notes must be sent on the Prepared Blanks.

Dora—Pompey. C. M. Whitcomb's (Boston, Mass.) black cocker spaniel bitch Dora to C. G. Browning's Pompey, Dec. 5.

Pug—Treasure. Chas. Steinkamp's (Newport, Ky.) pug bitch Pug (Punch—Judy) to Kentucky Pug Kenuels' Treasure (A.K.R. 472), Nov. 25.

Belle—Chief. Dr. I. A. Temple's (Toronto, Can.) red Irish setter bitch Belle to Max Wenzel's Chief (A.K.R. 231), Dec. 21.

Madge—Chief. W. H. Burr's (Phœnixville, Pa.) red Irish setter bitch Madge (Glencho—Norah) to Max Wenzel's Chief (A.K.R. 231).

Grace Glencho—Chief. I. M. Freeman's red Irish setter bitch Grace Glench (Glencho—Flame) to Max Wenzel's Chief (A.K.R. 231).

Swiss Rhona—St. Maurice. Hospice Kennels' (Newark, N. J.) St. Bernard bitch Swiss Rhona (A.K.R. 3030) to their St. Maurice (A.K.R. 3029), Dec. 12.

Sheila—Otho. Hospice Kennels' (Newark, N. J.) St. Bernard bitch Sheila (A.K.R. 795) to their Otho (A.K.R. 483), Dec. 15.

Belline II.—Otho. Hospice Kennels' (Newark, N. J.) St. Bernard bitch Belline II. (A.K.R. 3033) to their Otho (A.K.R. 483), Dec. 19.

Dashing Jessie—Glen Rock. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Jessie (Dashing Monarch—Blue Belle) to his Glen Rock (Druid—Princess Draco), Nov. 30.

Armida—Glen Rock. L. Yearsley, Jr.'s (Coatesville, Pa.) English setter bitch Armida (Leicester—Pocahontas) to E. W. Jester's Glen Rock (Druid—Princess Draco), Dec. 1.

Dashing Belle—Glen Rock. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Belle (Dashing Monarch—Blue Belle) to his Glen Rock (Druid—Princess Draco), Dec. 9.

Midget Dell. Benj. Earl's (Providence, R. I.) beagle bitch Midget to A. H. Wakefield & Co.'s Dell (A.K.R. 319), Nov. 15.

Tilly—Little Duke. Chas. H. Lounsbery's (Providence, R. I.) beagle bitch Tilly (Smuggler—Little Beauty) to A. H. Wakefield & Co.'s Little Duke (A.K.R. 1094), Nov. 8.

Little Beauty—Little Duke. Chas. H. Lounsbery's (Providence, R. I.) beagle bitch Little Beauty (A.K.R. 2590) to A. H. Wakefield & Co's Little Duke (A.K.R. 1094), Nov. 20.

Ruby—Bragg. P. D. Harp's (Simcoe, Can.) cocker spaniel bitch Ruby to Fleetfoot Kennels' Bragg (Wildair—Little Buttercup), Sept. 28.

Dot H.—Col. Mac. Fleetfoot Kenuels' (Delhi, N.Y.) cocker spaniel bitch Dot H. (Brag—Chipper) to their Col. Mac (Col. Stubbs—Beauty), Nov. 6.

WHELPS.

☞ **No'es must be sent on the Prepared Blanks.**

Brenda II. E. A. Moore's (Melrose, Mass.) mastiff bitch Brenda II. (A.K.R. 2219), Dec. 19, twelve (nine dogs), by his Ilford Caution (A.K.R. 2980).

Jessica. J. J. Prentiss's (Chicago, Ill.) English setter bitch Jessica (Count Noble—Nellie), Aug. 9, ten (four dogs), by Wm. B. Gates's Paul Gladstone (Gladstone—Lavalette); one dog and one bitch since dead.

Lillie. Coffin, Zimmer & Co.'s (Glens Falls, N.Y.) mastiff bitch Lillie (A.K.R. 2981), Dec. 10, one dog, by J. L. Winchell's Boss (A.K.R. 2218).

Floy. Coffin, Zimmer & Co.'s (Glens Falls, N.Y.) fox-terrier bitch Floy, Dec. 8, four dogs, by their Jim, Jr. (imported Jim—imported Silver).

Nellie. J. Oscar Jones's (New Haven, Conn.) Irish setter bitch Nellie (Doc—Flirt), Dec. 17, four (two dogs), by J. J. Phelps's Rococo (A.K.R. 2182).

Dora. Clifton Kennels' (Jersey City, N. J.) pointer bitch Dora (A.K.R. 1785), Dec. 21, nine (five dogs), by their Donald II. (A.K.R. 2545); all liver and white.

Lady Belle. Wm. Eaton's (New York) pointer bitch Lady Belle (A.K.R. 1788), Dec. 18, six (three dogs), by Clifton Kennels' Donald II. (A.K.R. 2545); all liver and white.

Wallkill Chloe. Archibald Gordon's (Middletown, N. Y.) cocker spaniel bitch Wallkill Chloe (A.K.R. 2901), Nov. 29, four (three dogs), by champion Obo II. (A.K.R. 432).

Gilt. C. M. Pettingill's (Cummington, Mass.) cocker spaniel bitch Gilt (Col. Stubbs—Diamond), Dec. 12, three (two dogs), by I. M. Dewey's Pilot (Sam—Daisy Dean).

Music. H. F. Schellhass's (Brooklyn, N. Y.) beagle bitch Music (A.K.R. 1411), Nov. 20, nine (four dogs), by his Trailer (A.K.R. 2525); three dogs and five bitches since dead.

Lorraine. J. A. J. Sprague's (Englewood, Ill.) red Irish setter bitch Lorraine (Elcho—Rose), Dec. 13, ten (eight dogs), by his champion Brush.

Pet H. Fleetfoot Kennels' (Delhi, N. Y.) cocker spaniel bitch Pet H. (Col. Stubbs—Beauty), Nov. 16, four (three dogs), by their Brag (Wildair—Little Buttercup).

Daisy M. Fleetfoot Kennels' (Delhi, N. Y.) cocker spaniel bitch Daisy M. (Col. Stubbs—Bess), Oct. 1, six (three dogs), by their Brag (Wildair—Little Buttercup).

Nellie Pride. Louis E. Haag's (Indianapolis, Ind.) Scotch collie Nellie Pride (A.K.R. 2819), Dec. 7, eight (five dogs), by W. Wilkison's Frank H. (Gary—Lady).

Flora. Woody Crest Kennels' (New York) collie bitch Flora (Highland Laddie—Beauty), Oct. 11, four (one dog), by their Hero (Kent—Bessie).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Fairie Queen. White bull-terrier bitch, whelped Nov. 8, 1885, by The Earl out of White Rose (A.K.R. 2906), by Frank F. Dole, New Haven, Conn., to C. H. Stevens, Hoboken, N. J.

Ivory. White bull-terrier dog, whelped Nov. 8, 1885, by The Earl out of White Rose (A.K.R. 2906), by Frank F. Dole, New Haven, Conn., to Phillip Raudolph, Phi adelphia, Pa.

Viscount. White bull terrier dog, whelped Nov. 8, 1885, by The Earl out of White Rose (A.K.R. 2906), by Frank F. Dole, New Haven, Conn., to Paul Claystone, Minneapolis, Minn.

Fly. Italian greyhound dog, 20mos. old, by Duke out of Topsie, by Jas. E. Hair, Bridgeport, Conn., to C. M. Elmore, Winsted, Conn.

Laone II. Orange tawny and white St. Bernard bitch, whelped Oct. 7, 1885, by Czar (Don—Gretchen) out of Laone (A.K.R. 2416), by Coffin, Zimmer & Co., Glens Falls, N. H., to Geo. Wilcox, same place.

Lulu. Orange tawny and white St. Bernard bitch, whelped Oct. 7, 1885, by Czar out of Laone (A.K.R. 2416), by Coffin, Zimmer & Co., Glens Falls, N. Y., to C. E. Huested, Nassau, N. Y.

Czar—Laone (A.K.R. 2416) whelps. Orange tawny and white St. Bernard dog and bitch, whelped Oct. 7, 1885, by Coffin, Zimmer & Co., Glens Falls, N. Y., to B. Fowler, same place, and bitch to Dr. A. T. Smith, Minneapolis, Minn.

Discord. White, black and tan ticked beagle bitch, whelped Aug. 11, 1885 (A.K.R. 2915), by Coffin, Zimmer & Co , Glens Falls, N. Y., to Wm. H. Peare, Fort Edward, N. Y.

Trailer II. White, black and tan beagle dog, whelped Jan. 15, 1885, by Bounce out of Myrtle, by Dr. M. F. Young, Littleton, N. H., to F. H. Twitchell, Lancaster, N. H.

Daisy P. Chestnut, tan and white English setter bitch, whelped Aug. 9, 1885, by Paul Gladstone out of Jessica, by J. J. Prentiss, Chicago, Ill., to J. Delamater, same place.

Niobe. Silver fawn pug bitch, whelped July 18, 1885, by Bradford Ruby out of Bess, by City View Kennels, New Haven, Conn., to S. H. Gow, Mamaroneck, N. Y.

Mikado. Apricot fawn pug dog, whelped July 18, 1885, by Bradford Ruby out of Flossy, by City View Kennels, New Haven, Conn., to L. Brandeis, Brooklyn, N. Y.

Elcho, Jr.—Ruby whelps. Red Irish setters, whelped May 10, 1885, by Will G. Simons, Manchester, N. H., a dog to W. B. Hull, Buffalo, N. Y., and a bitch each to Chas. S. Surran, Newport, Ky., and C. W. Roedenburg, Hoboken, N. J.

Donald II. (A.K.R. 2545)—Lady Bang (A.K.R. 698) whelp. Liver and white pointer dog, whelped June 29, 1885, by Clifton Kennels, Jersey City, N. J., to W. P. Stone, Harlan, Ia.

Tom. Black and tan Gordon setter dog, whelped Dec. 2, 1885, by Ben Butler out of Quail, by C. T. Brownell, New Bedford, Mass., to James Symon Fisk, Cambridge, Mass.

Fizzy—Lily whelps. Black, white and tan fox-terrier dog and bitch, whelped Oct. 25, 1885, by C. T. Brownell, New Bedford, Mass., to G. H. Sheldon, New York.

Zeulah. Black and tan Gordon setter bitch, whelped Dec. 20, 1885, by Dan out of Beulah, by C. T. Brownell, New Bedford, Mass., to W. B. Bowen, Rockland, Mass.

Fancy. Liver and white cocker spaniel bitch, whelped May 23, 1885, by Rex out of Edith, by Chas. E. Taylor, Bath, Me., to Scott Frye, same place.

Aunty Fuller. Lemon belton English setter bitch, whelped June 9, 1885, by Glen Rock out of Countess Flirt, by E. W. Jester, St. George's, Del., to W. R. Travers, Washington, D. C.

Dash. Orange and white English setter dog, age unknown, by Don out of Belle, by E. W. Jester, St. George's, Del., to J. R. Hoffecker, Middletown, Del.

Glen Lea. Black, white and tan English setter dog, whelped July 18, 1885, by Glen Rock out of Leah II., by E. W. Jester, St. George's, Del , to H. W. Gause, Wilmington, Del.

Glen Nettie. Lemon belton English setter bitch, whelped Dec. 16, 1885, by Glen Rock out of Dashing Belle, by E. W. Jester, St. George's, Del., to W. F. Streeter, Lehigh Tannery, Pa.

Countess Flirt. Black, white and tan English setter bitch, whelped Sept. 9, 1882, by Tempest out of Flirt, by E. W. Jester, St. George's, Del., to Geo. C. Sterling, New York.

Count Lofty. Fawn English mastiff dog, whelped Oct. 2, 1885, by Count Waldo out of Lofty, by E.W. Jester and J. V. Vail, St. George's, Del., to Dr. J. A. Hartmann, Latrobe, Pa.

Prince. Tawny and white collie dog, whelped Aug. 29, 1885 (——Friday), by E. W. Jester, St. George's, Del., to David Adams, same place.

Lew. Tawny and white collie dog, whelped Aug. 29, 1885 (——Friday), by E. W. Jester, St. George's, Del., to Thos. Davidson, Summit Bridge, Del.

Julius Cæsar. Liver and white native setter, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Nora. Black, white and tan beagle bitch, age and pedigree unknown, by E. W. Jester, St. George's, Del , to Associated Fanciers, Philadelphia, Pa.

Jane. Tan and white beagle bitch, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Dude. Black, white and tan beagle dog, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Lady. White and tan beagle bitch, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Tobe. Black, white and tan beagle dog, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

West. Black, white and tan beagle dog, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Dal. Black, white and tan beagle dog, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Jean. Black, white and tan beagle bitch, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Associated Fanciers, Philadelphia, Pa.

Frisky. Tan and white beagle bitch, age and pedigree unknown, by E. W. Jester, St. George's, Del , to Dr. J. A. Hartmann, Latrobe, Pa.

Ready. Red tan beagle dog, age and pedigree unknown, by E. W. Jester, St. George's, Del., to Dr. J. A. Hartmann, Latrobe, Pa.

Babie. Fawn and white Italian greyhound bitch, whelped Dec. 27, 1884, by Fido out of Daisy, by E. W. Jester, St. George's, Del., to H. C. Burdick, Springfield, Mass.

Obo II. (A.K.R. 432)—Critic (A.K.R. 303) whelp. Black cocker spaniel bitch, whelped July 10, 1885, by W. O. Partridge, Boston, Mass., to A. C. Collins, Hartford, Conn., and resold by him to F. Stengelin, same place.

Bragg—Daisy II. whelp. Black cocker spaniel bitch, whelped Oct. 1, 1885, by Fleetfoot Kennels, Delhi, N. Y., to Jesse D. Welch, New Haven, Conn.

Bragg—Jess whelp. Liver and white cocker spaniel dog, whelped Oct. 6, 1885, by Fleetfoot Kennels, Delhi, N. Y., to Geo. H. Carr, New Haven, Conn.

Trailer (A.K.R. 2525)—Silver (A.K.R. 2523) whelps. Two beagle bitches, whelped July 6, 1885, by A. H. Wakefield & Co., Providence, R. I., to Wm. Tallman, Tarrytown, N. Y.

PRESENTATIONS.

Flossie P. Chestnut and white English setter bitch, whelped Aug. 9, 1885, by Paul Gladstone out of Jessica, by J. J. Prentiss, Chicago, Ill., to Mrs. N. Swift, same place.

Bessie P. Chestnut, white and tan English setter bitch, whelped Aug. 9, 1885, by Paul Gladstone out of Jessica, by J. J. Prentiss, Chicago, Ill., to Samual Findley, same place.

Fly. Italian greyhound dog, 20mos. old, by Duke out of Topsie, by C. M. Elmore, Winsted, Conn., to F. E. Andrews, same place.

DEATHS.

Kate. Lemon pointer bitch, whelped March, 1876 (A.K.R. 917), owned by Chas. E. Coffin, Muirkirk, Md., Dec. 7.

Nelly Blythe. Pointer bitch, owned by Wm. Donner, Green Island, N. Y., Dec. 23; poisoned.

Rifle and Trap Shooting.

RANGE AND GALLERY.

A NEW TARGET.—Referring to the new target recently proposed by Mr. Farrow, I am surprised that the matter has not been discussed in your columns by many who are well qualified to present intelligent views on the subject. There are too many targets in use. The marksman cannot keep the run of them. It is not a sign of ignorance in any one to be unable to give the several dimensions of the half dozen targets in use at the present time. It is a crying evil which should be remedied at once. The Farrow target is a practical one and I think will meet the requirements of nearly all classes of target shooters. The German sharpshooters will probably still use their ring target for off-hand shooting, and the heavy telescopic hair trigger rest shooter will prefer string measure, but other classes of marksmen will find in the new target all they require for practice at 200yds. Several excellent plans for targets have been proposed, and for the regularity of the increase in the width of the divisions from the center outward reflect great credit on their designers. The main objection I would offer to their adoption would be that they do not preserve the divisions of tne third class Creedmoor target, and the measurements of some are in such small fractions of an inch that it would require an expert to draw the circles. This should not be the case as many shooters make their own targets, and if it be desired to adopt a target that will come into general use, such target must be so simple in its several dimensions that each and every shooter can manufacture his own. It is important that we avoid complicated fractions in the measurement of the circles of the 200yds. target, as many will want to reduce it to half size for practice at 100yds.—E. A. L. (Norristown, Pa , Dec. 20).

BOSTON, Dec. 25.—Many small-bore riflemen, as well as a strong delegation of military rifle shooters, faced the targets at Walnut Hill to-day. The conditions were rather trying, a fickle 12 o'clock wind disturbing elevations and windage, and causing high scores to be few and far between. The directors of the association announce that the Thursday shoots will be discontinued after Jan. 1. The scores:

Military Match (Standard American Target).

J. Francis	7	6	8	9	9	6	8	10	7	7—77
L. Herbert	10	5	6	5	4	8	5	6	3	6—61
W. Henry	3	8	10	6	6	5	2	5	5	8—53
W. H. Oler	5	5	6	1	6	3	5	7	4	7—49

Practice Decimal.

C. E. Berry	5	6	7	8	7	7	7	10	8	7—72
C. B. Edwards	6	5	5	8	7	9	7	8	8	7—70
J. Lemon (mil.)	5	7	8	5	4	8	5	8	5	4—59
J. H. Again	7	7	3	4	9	3	5	7	4	6—57
A. Lawton	7	5	5	5	8	5	5	8	5	4—57

Best Match.

D. Webster, A	8	9	10	9	9	9	8	10	10	10—92
T. Stewart, A	10	10	9	9	10	8	9	10	9	7—91
J. Hurd, A	10	10	9	8	9	8	9	10	7	9—89

State Militia Match.

Sergt. F. C. Sheppard	20	20	21	22

Dec. 26.—There was a slim attendance at Walnut Hill to day, and the few present found the worst shooting conditions of the year, the wind blowing strong from 12 o'clock. The scores:

Decimal Match.

J. Francis (mil.) B	10	7	10	7	8	9	8	7	7	10—80
C. E. Berry, A	9	10	9	8	9	10	7	4	6	8—80
W. Henry (mil.) A	9	4	6	7	7	8	10	8	5	6—70
A. Duffer (mil.) B	5	6	6	6	6	8	8	7	8	8—68
Fitzer, A	8	5	5	7	4	4	5	6	7	6—57
H. Spaulding	7	3	4	8	7	4	6	8	8	5—55

SARATOGA, Dec. 24.—The regular shoot at the Glen Mitchell Range by members of the Saratoga Rifle Club took place to-day. The weather conditions were at first tantalizing. The light was so bright and dazzling that the bullseye, when looked at over the rifles, would blink, wink and dance about as if bewitched, the wind seemed determined to be in accord, as it blew from all points of the compass, but from no point sufficiently long for dependence on it. Later in the day everything changed. As the sun lowered in the west the light became good and the wind settled down to a steady point and a half breeze from the northwest. Then good scores began to make their appearance. Massachusetts target, 200yds., off-hand. The following is the record:

W B Gage	11	11	11	11	11	11	11	11	11	11—111
W H Gibbs	8	11	11	11	11	12	10	11	11	12—108
F A White	12	11	10	11	11	8	10	9	10	10—102
J N Crocker, Jr	10	10	9	11	10	11	12	9	10	9—101
W H Bryant	7	8	7	8	7	11	6	9	9	7—77

The score above, expressed according to Creedmoor rules, reads thus: Creedmoor target—5555555555—50.

MANCHESTER, N. H., Dec. 25.—The strong, fluctuating wind made the making of high scores by the club men to-day a difficult matter, but the sport afforded was none the less attractive because of this. The best single scores by each man out of a possible 100, at rest, were:

C W Lyman	7	9	10	10	10	10	9	10	10	10—95
F J Drake	10	9	10	10	9	9	9	9	9	10—94
C D Palmer	8	9	8	10	10	10	10	9	10	9—93
G A Leighton	9	9	9	8	10	9	9	10	20	9—92
E C Paul	9	9	10	6	10	9	10	10	9	10—92
T C William	9	10	8	10	10	9	9	8	8	10—91
Frank Jay	8	9	10	8	9	10	9	10	7	6—86
J Hodge	8	9	9	8	9	9	9	9	7	7—84
C M Henry	6	10	10	9	7	8	10	8	8	8—84
N Johnson	10	9	7	7	8	7	10	7	10	8—83

HILLSIDE CLUB.—The Hillside Rifle Club, of Waltham, Mass., had a shoot Dec. 25, using the Hinman target, at 200yds. In a bad wind, the following scores were made:

Off Hand.

J Foster	7	6	8	7	7	4	7	7	10	7—70
F Wheeler	5	9	5	10	10	3	8	6	7	4—70
W Vaugher	6	5	8	7	10	5	9	7	4	4—65
L O Dennison	4	7	8	8	6	8	6	6	5	9—68
E A Emerson	8	6	5	10	5	7	4	4	5	8—62
W stone	4	5	10	2	10	2	8	7	9	5—62
J R Munroe	6	5	5	6	5	7	5	4	4	5—55
Edward Bassett	6	2	4	4	5	6	5	4	7	4—47

Rest Match.

E A Emerson	9	10	8	7	9	8	10	9	10	9—89
W Mitchell	6	8	6	6	6	6	7	6	6	10—67

A GRATEFUL PIKE.—R. W. Pike is a Chicago lawyer, who signs "Dane" to his articles on rifle ball trajectories. The other day Mr. Pike had occasion to use for his own advantage some of the data determined by the FOREST AND STREAM'S rifle trajectory tests, and he gracefully acknowledged his obligation by crediting the figures to "a report of the late rifle trajectory tests at Creedmoor, which appears in a New York canoe club organ." The compliments of the season to Mr. Pike, and more breadth to his caudal fin. In 1886 may many gudgeons swim into his lair.

ZETTLER RIFLE CLUB—Dec. 22.—Regular club shoot, ring target; possible, 120; gallery, 100 feet long: M. L. Riggs, 114; L. Flack, 107; B. Zettler, 112; C. G. Zettler, 110; G. Zimmerman, 114; B. Wahlter, 99; M. B. Engel. 109; D. Miller, 114.—N. D. WARD.

JAMESTOWN, N. Y., Dec. 26.—Inclosed find scores for Christmas day, rifle, 200yds., Creedmoor target:

Burns, Stevens	4 4 5 5 5 4 5 4 4 5—45
Starr, Ballard	4 4 4 4 4 4 3 4 5 4—40
Winslow, Remington	5 4 4 4 4 4 5 5 4 4—43

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

WELLINGTON, Mass., Dec. 25.—The attendance at the holiday match at Wellington to-day was up to the average. The result of the shooting was as follows: 1. Five pigeons—Bancroft first. 2. Five pigeons—Pond and Blynn first. 3. Five blackbirds—Bancroft first. 4. Five pigeons—Schaffer and Snow first. 5. Five pigeons—Pond first. 6. Five blackbirds—Wardwell and Parker first. 7. Five pigeons—Steele first. 8. Five blackbirds—Pond and Steele first. 9. Five pigeons—Parker and Bancroft first. 10. Five blackbirds—Pond first. 11. Five pigeons—Schaffer first. 12. Five blackbirds—Parker and Wardwell first. 13. Five pigeons—Blynn and Wilson first. 14. Five blackbirds—Snow and Wardwell first. 15. Five pigeons, straightaway—Sanborn, Wardwell and Parker first. 16. Five blackbirds, straightaway—Popanti first. 17. Five blackbirds—Wardwell first. 18. Five blackbirds, miss and out—Swan first.

The contest for the medals was renewed on the 26th, resulting in Adams taking first with 8 birds, Dickey second with 7 and Wilson third with 5. The other events were taken as follows: 1, Ten pigeons—Adams first. 2. Five pigeons—Pond first. 3. Five pigeons—Nichols first. 4. Five pigeons—Smith and Wardwell first. 5. Five pigeons—Wardwell first. 6. Miss and out—Taken by Pond. 7. Five pigeons—Adams first. 8. Five blackbirds—Nichols first. 9. Five blackbirds—Shumway first.

NEWARK, N. J., DEC. 25.—The Christmas tournament of the South Side Gun Club was the most interesting contest of the year. Seventeen sweeps and matches were shot at clay birds at distances varying from 10 to 18 yards. The shooting throughout was excellent, although a stiff wind was blowing across the shooting field. Among the guests participating in the sweeps, were members of the Elizabeth and Nimrod Gun Clubs. The South Side Club match at 20 birds, 18 yards rise, trap set at fourth notch and both barrels allowed. Seven members contested, with the following result: Hobart, 19; J. C. Day, 15; E. Unger, 15; Pickering, 13; Breintnall, 11; Freeman, 10; D Terill, 10. Day and Unger shot off for second place and the former won. The total scores for the day were: Breintnall, broke 24 out of 40, Philips 64 out of 105, D. Terrill, 17 out of 35 J. C. Day, 18 out of 40, P. M. Day, 16 out of 35, Horbart, 84 out of 105, Stringer 11 out of 60, E. Unger, 15 out of 35, Pickering, 13 out of 25, Freeman, 4 out of 15, Coriel, 8 out of 15, A Wheaton, 33 out of 60, Garrabrant 7 out of 15, Astfalk, 5 out of 15, Dean, 10 out of 15, W. Parker, 15 out of 25, H. Knight, 20 out of 35, Williams, 9 out of 15, Haskard, 11 out of 25 Hedden, 9 out of 20, Glaze, 16 out of 45, Weston, 19 out of 30, Winans, 19 out of 35, W. Wheaton, 1 out of 5, J. Wheaton, 4 out of 10, Whitehead 4 out of 10.

In the side match Philips, Horbat and Terrill were pitted against Knight, Hedden and A. Wheaton, ten birds each, 16 yards, fourth notch. Philips' side won by breaking 14 out of 30, eight breaks being credited to Hobart. The other side broke 13. The South Side Club is negotiating for a supply of crows for the annual crow shoot.

TORONTO, Dec. 22.—A pigeon shooting match between N. Rodgers and J. Tyng came off at John Oulcott's, Eglinton, this afternoon. The weather was fine and helped to bring out a large number of sportsmen. The birds were all flyers. The match was shot under Toronto Gun Club rules, 25 birds each, 26 yards rise. As will be seen from the following score, a very close contest was witnessed:

Rodgers	0111111111100001010110111—17
Tyng	1111110111000001111010111—17

As both had killed 17 birds it was necessary that they should have another trial. They went back three yards from the original position and shot at five birds each, 29 yards' rise. The following was the result:

Rodgers	11001—3
Tyng	10011—3

In order to decide the tie they went back three yards further, shooting at 32 yards' rise. Tyng killed the two birds sent up, while Rodgers missed. The match was thus given to Tyng.

JAMESTOWN, N. Y., Dec. 26.—Match with shotguns on Christmas day, Peoria blackbirds, 18yds.:

Carnahan	1111111111101111100111101101—25
Burns	1111110110101111010101111111—24

Gosline	0101000100010111011010001110—14

NEWARK, Dec. 26.—L. B. Campbell, of Little Silver, and J. H. Outwater, of Moonachy, shot a pigeon match this afternoon at Erb's Grounds, on the Bloomfield road, which resulted in a victory for the South Jerseyman, who shot his opponent out in the thirty-fourth round. The match was for $300, 35 birds each, 25yds. rise, one barrel, find, trap and handle. J. Ryan, of Montclair, was referee, and C. Applegate and J. Erb judges. The score was:

Campbell	00111 10111 01101 11010 11111 01011 11110—25
Outwater	10111 01111 01101 10101 00110 11101 11000—22

WILLIAM GILES, an English shot, has come to this country and professes to want to shoot a match with Dr. Carver.

DR. CARVER, having presumably exhausted the match trap shooting mine, has been giving exhibitions of his skill at country fairs. Carver handles a gun in a style worth going a long way to see. Hundreds of silver coins, broken by his rifle bullets, are carried as pocket pieces.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc , of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

SECRETARY—Dr. C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, accompanied by the recommendation of an active member of the A. C. A., together with the sum of $3 for initiation fee and first year's dues, to the secretary, who will present the names to the commodore. Money should be sent by *registered letter*, or money order on Saratoga Springs, N. Y.

INTERNATIONAL CHALLENGE CUP.

Editor Forest and Stream:

I beg to acknowledge further contributions as follows: Through Henry A. Harrison, Purser Newburgh Canoe and Boating Association:

Mr. Nate S. Smith (A. C. A, No. 153)	$1 00
Mr. James T. Van Dalfsen (A. C. A. No. 561)	1 00
Mr. W. G. Van Dalfsen (A. C. A. No. 562)	1 00
Mr. Grant Edgar, Jr. (A. C. A. No. 563)	1 00
Mr. Henry A. Harrison (A. C. A. No. 620)	1 00
	$5 00
Mr. James Z. Rogers, Peterborough, Ont.	1 00
Mr. E. H. Barney, Springfield, Mass.	1 00
Mr. G. M. Barney, Springfield, Mass.	1 00
	$8 00
Previously acknowledged	64 00
Total to date	$72 00

WM. WHITLOCK, Chairman.

No. 37 WEST TWENTY-SECOND STREET, Dec. 19, 1884.

WIDE AND NARROW CANOES.

THE following letter was received for publication last week, but lack of space prevented its insertion then:

Editor Forest and Stream:

In his letter in the FOREST AND STREAM of Dec. 17, Mr. Clapham rather dodges the questions asked of him, and gives only some amusing generalities in place of any definite statements justifying or supporting his attack on the canoe. As far as his new boat is concerned, no matter what relation she may bear to existing canoes or to the A. C. A. rules, if she proves a safe, speedy and comfortable craft that will meet the requirements of any boating men, let us have her by all means, and if she is adapted for cruising and not merely for racing, the Association can do nothing better than to admit her.

I give Mr. Clapham all credit for his honest efforts to improve our sailing boats, but could he not have accomplished as much without starting out, like "Deja," with a wholesale attack on canoes? I doubt whether Mr. Clapham has ever been in a canoe, or whether he knows much more about them than another critic proved to, but this does not hinder him from saying that the two thousand or more who do use such boats do not know what they want. The canoe of to-day is the result of a thorough and complete system of evolution. She has been the subject of careful study by many able men for over twenty years, and for her purpose, including sailing on lakes and wide rivers, she is not surpassed by any boat afloat. I do not mean to say that no other boat can outsail a canoe, but that the latter represents a better average of desirable qualities than any boat of similar size. That she is unsafe, unhandy, cranky, dangerous or uncomfortable in a greater degree than is necessary in any small boat, neither Mr. Clapham nor "Deja" have yet proved. In her place, she is and probably will be for a very long time unsurpassed. The only point to determine is just when to abandon a canoe for a larger boat.

For ordinary racing as at the meets, she answers fully the purpose of hundreds who use her, which is very good proof, taken with her performances at times against much larger boats, of her excellence in that particular. For general cruising on American water courses with the average amount of land transport, beaching and stowage, for carrying one man and his stores, for propulsion by sail and manual labor combined, she is far ahead of any other type of boat yet produced. The work done by the ordinary 15x30 canoe speaks for itself. Cruises down the full length of the Delaware, the Susquehanna, the Hudson, St. Lawrence, Ohio and Mississippi rivers, in waters varying from a trout brook to Delaware Bay and the Gulf of Mexico, have been made over again without an upset. Such voyages are on record as established facts, but as soon as a man has a new boat to introduce he quietly ignores their evidence and starts out with the preamble:

"Whereas, all canoes are dangerous, unhandy, complicated, unsportsmanlike, and fitted with such pernicious devices as lug sails, cam cleats, paddles, steering gear, lead keels, patent anchors, aprons, hatches, etc., and do not combine in one small boat the speed of the racing shell, the sailing prowess of the Puritan, the stowage capacity of an ocean steamer, and the seagoing qualities of a pilot boat. Resolved, that all canoeists at once purchase and use So and So's patent brass mounted, copper-lined, combination canoe-cutter-sharpie with automatic sneakbox attachment, built of specially rolled sheet steel and thoroughly fastened with best brown paper, laid in vinegar cement." Now, gentlemen, who wish to reform the canoe, cannot you admit that the men who have devised, built and used canoes, know at least a little as to what they want and the qualities of the boats they use?

There are many open waters for which canoes are too small, but the length and breadth of Long Island Sound is traversed every year by them, and a Class B canoe, in the hands of a fairly expert man, exercising ordinary judgment and caution, as a sailor should, is perfectly fitted for summer sailing on this or wider waters. If, however, sailing in open water is the sole or principal end in view, then the field opens to the larger boat, a better sailer, perhaps, but not to be paddled, and less of an "all around" craft. There is room in this country for an immense fleet of these; large canoes, small sharpies, sneakboxes, canoe yawls, of models to suit all localities; but this does not prove a single fact against the good qualities of the A. C. A. canoes. As to Mr. Clapham's proposed 30-footer, criticise without knowing more about it, but I will venture to predict that, if built to his proposed specifications, as I understand them, 15 feet by 37, or even 42 inch beam, 6 inch draft, and say 115 pounds weight, without other ballast than a 30-pound board, that she will not be in any sense uncapsizable, and that she will not be either safe or handy for a man who has not the skill to handle a good Class B canoe.

To any canoeist Mr. Clapham's insinuations about lead keels on canoes and their other undesirable qualities will carry no weight, but lest they should convey a very false idea to novices, I venture to assert that not 5 per cent. of the existing canoes have lead keels or any considerable amount of fixed ballast, that canoes can be and many are sailed with no ballast, and that a good canoe in cruising trim can be made to float safely herself and load, and lend sufficient aid to her crew. A sailing race only between a canoe and the new boat would prove nothing in regard to the question in dispute. It would be easy to build a sailing machine that would outsail the average canoe, built under many rules and restrictions, in most weathers. Is Mr. Clapham looking for another glorious victory such as he boasts of, in which a large sail-boat, with racing sail, beat a jury-rigged canoe in little more than a drifting match? There is plenty of good work to be done, canoeists are growing up and progressing and some day will want larger boats. They will be glad of Mr. Clapham's aid, but he can accomplish just as much without depreciating and misrepresenting the CLASS B CANOE.

Editor Forest and Stream:

Perhaps, should Mr. Clapham and the other fellow give us a definition of a canoe, it might be able to understand why it is that he uses the term "canoe" to designate his "boat, roomy little cruiser."

If canoes are what they are stated to be—"a disgrace to her ancestors," "an umbrella," &c.—Mr. Clapham should avoid classing his boats with such disreputable craft. The very use of the word "canoe" therefore inplies either that he and the other fellow do not know what a canoe is, or that the canoe of to-day is not a canoe.

Mr. Clapham "whispers" that it was the other fellow. Why is this? Is Mr. Clapham ashamed of the fact that in order to strengthen his canoe he must endeavor to weaken and run down those now in use? He will not likely succeed in making converts from the ranks of canoeists by this method. That there are men who are not fit to be canoeists is well known. Perhaps I am unjust to Mr. Clapham. It may be that the other fellow is also responsible for the second article on "wide and narrow canoes." Should this be the case it might be well for Mr. Clapham to institute proceedings to restrain such articles which to say the least are apt to injure his reputation as a canoeist.

WASHINGTON, D. C. L.

Editor Forest and Stream:

I am tempted once more to risk making myself ridiculous by replying to a question which I could hardly have imagined could ever be seriously asked, viz, the second one of "Hal's," "What is the objection to making changes in the A. C. A. rules to meet that class of larger canoes?" To his first question I should say there is no objection in their proper place, though he gives me credit with being too narrow-minded to admit of any merit in a boat for which I have immediate personal use. But the most obvious objection to a change in the A. C. A. rules to admit boats of 42in. beam is, that it would at once cause a conflict of interests: the location for a meet most suitable to the majority of the Association, as at present constituted will not be acceptable to the new comers, as friend "Hal" is bound to admit, seeing he has already proposed a salt water meet.

I fancy, Mr. Editor, that when you used the words "legitimate cruising craft," which "Hal" quotes, yourideas were far from the salt water which surrounds your abode; for, if otherwise, where would this thing stop? If the rules were changed to take in 42in. boats, would not 48in. have an undeniable right to demand admittance? And so the thing would go, like the row of bricks of our childhood, until a certain party I wot of, now on the other side of the globe, engaged in a two years' cruise around the world in a 200-ton schooner, would on their return at once apply for admission to the A. C. A., for are they not "legitimate cruisers?" No, no, my dear "Hal," if your heart is set upon a 42in. craft, don't waste time trying to convince the A. C. A. they need such a class, but go and join the American Single-Hand Cruising Club, if indeed that body has not seen the testimony of "Charis" in that same FOREST AND STREAM to the effect that a 15½x42 "canoe" is not even a single hander, but a yacht requiring two men to manage her.

I should like to review "Hal's" entire article—especially such cool assumptions as that of the weight of a 42in. boat being no greater than one of 30in. beam—but out of consideration for your readers I refrain. But just one question I will permit myself: About those two canoes of the Newburgh Club in "Long Shanks'" lists—does he mean the Dido and Day Dream? And which one is it that is benefited by the change? Also, how does he justify a classification which separates two twin canoes (Sea Bee and Inertia), built from the same moulds by the same man? KATRINA.

A GUTTA PERCHA BOAT FOR "DEJA."—I have sold the Eagle for more than she cost after almost four years' use, and am confidently looking forward to a gutta percha ship large enough to admit of a little cabin without impairing her sailing qualities, and small enough to secure portability by dispensing with ballast. She will be moulded in one solid piece, smooth as glass, and capable of holding together longer than any toggled conglomeration of wood and copper. If canoeists will be kind enough to honor her with the dignified title of yacht I shall feel grateful, and hasten to assure them that I entertain the greatest respect for their good opinion, although a waterline length of 19ft. is rather limited for a "waltzer" of that description. One of the many correspondents who intends to build finds it necessary to limit his draft of water to 2ft. He is a resident of British Honduras, where the mouths of the rivers are shallow; but, like several others who have taken the trouble to write to me, finds my design just the thing for his part of the world, as it promises more comfort than a canoe, without any great excess of expenditure in either time or money. I think if this gentleman will do as several others have done—extend the forebody of my published design enough to secure an extreme length of 17ft. on the same beam and add only 3in. to the draft of water—he will secure the best results obtainable in so small a hull, because the ratio of increase in propulsion, as represented by an added but entirely safe sail area, far exceeds that of frictional resistance. The Eagle has fully demonstrated "a fact" quite as substantial and certainly just as logical as the canoe, namely, that speed results from a proper introduction of concentrated displacement. It is depth and body which tell. These two factors are quite as prolific as length, especially where comfort becomes one of the requisites. However, I have no misunderstanding with canoeists, and if they imagine that I am "a foe," it is simply a mistake on their part. I am only a sympathetic friend, who would aid them in their misfortunes by improving the primitive condition against which they are contending with such unequal odds. The "fighting" may be left to my new convert. "On, ye brave!" In the meantime I will furnish the lines of the gutta percha, which I hope FOREST AND STREAM will reproduce anon.—DEJA.

NEW YORK C. C.—On Christmas Eve two of the club, Mime and Jersey Blue, were out for a moonlight paddle until 1 A. M. On Christmas Day the crew of the Tomboy took their last sail, a pleasant one, in spite of the cold and a heavy east wind. On returning, her moorings were hove up, mast lowered and she was run in on the beach, where she now reclines under the windows of Marmalade Lodge. Next year she will come out with a heavier lead keel and a mizzen. Com. Munroe is now having a 15x28 canoe from Everson's shop, and Vice Commodore Stephens has partly decked a 15x30 canoe with two plate boards, one in the extreme after end. This latter boat, built from the owner's designs, by J. MacWhirter, is fitted with a peculiar arrangement of hatches, similar to those of the Pearl, and with a rudder fastening invented by her owner. A silk flag has been offered by a lady friend of the club for the first race won in 1886. Mr. Vaux has sold the Lark to Mr. Livingstone, also of the N. Y. C. C. The handsome canoe put up at the fair of the Staten Island Athletic Club was won by Mr. Charles Wardell, N. Y. C. C., owner of the Sunbeam.

A LONG CANOE CRUISE.—On July 4, Mr. W. E. Hermance started in a canoe, 15ft x34in., from Livingston, M. T., for a cruise down the Yellowstone, reaching St. Louis after a cruise of three months. In the first 600 miles there are but two towns, while there are nine rapids, all of which were run. At Kansas City Mr. Hermance was joined by his brother, who will accompany him to New Orleans, in a similar boat. The trip on the Yellowstone was enlivened by adventures with cowboys and hostile Indians, but St. Louis was reached in safety.

ROCHESTER C.C.—The annual dinner and election of officers took place on Dec. 8, the meeting being held first at the club rooms. The officers elected were: C. H. Moody, Captain; H. L. Ward, Mate; Geo. H. Harris, Purser; S. C. Eaton, H. J. Wilson and C. F. Wolters, Executive Committee. A new constitution and by-laws were presented, but action was deferred to the next meeting and the members adjourned to the Brockett House, where a dinner was laid for them.

A CHANGE OF PARTNERSHIP.—Mr. F. Joyner, of Glens Falls, N. Y., writes us that he has purchased the interest in the business of his son, E. Joyner, and will hereafter conduct the business alone, building the same line of canoes, light hunting boats and steam launches for which the firm has been so well known.

BROCKVILLE C. C.—This club will receive their friends on Wednesday, Dec. 40, at Victoria Hall, Brockville.

AMERICAN CANOE ASSOCIATION.—Mr. H. C. Randolph, Whitestone, N. Y., is a candidate for membership.

Yachting.

Address all communications to the Forest and Stream Publishing Co.

THE CRUISE OF THE PILGRIM.—I.

BY DR. W. H. WINSLOW.

THE Pilgrim was floated before daylight, August 15, and with cruising rig, sailed in the third class of the Hull Yacht Club regatta at 1 P. M., the same day, without winning anything but applause from the judges. We did not expect anything, and were rather pleased at the performance of the new craft under the cramps of newness. I had concluded to build a cruiser, late in the spring, having become pretty well posted during the winter by reading the FOREST AND STREAM, in the columns of which I had seen the plans and description of the Mamie. Somehow she just struck my fancy and suited my requirements and finances, and I began a correspondence with the builder which ripened into a specific contract for a similar craft. I gave him carte blanche as to lines, favoring the cutter type.

The boat is 21ft. water line, 25ft. over all, 7ft. beam, 5ft draft, with a slender overhang and a stern 2½ft. wide. The iron keel weighs 3310lbs., and there are 1300lbs. of cast iron ballast under the floor. The rail is 2¼in. high; the cockpit is 4ft. long, 3½ft. wide, six inches below the deck and six above, and has a 9in. wide seat upon the top of its staving. The cabin trunk is 7½ft. long, 5ft. wide and 1ft. high and has rounded corners, a 20in. wide gangway and two oval windows upon each side.

The cabin was arranged according to a plan I hit upon in cogitating over how I could make more sleeping room, and is somewhat unique and just adapted to a small cruiser. The whole interior of the boat was left open from the eyes to the run. An oil stove was fitted upon a shelf in the fore peak; a shelf above and a cross piece below furnished two good storage places. A series of divided and railed shelves for dishes and stores was built upon the right side as far as the starboard transom, yet leaving room for passage between them and the foremast. The port transom was lengthened when necessary by a grating seat that reached past the foremast and furnished a seat for the cook, and bedroom, but when not in use, was buttoned back against the sheathing. A small hatch was placed in the deck over this for ventilation and cooling off. The transoms were 18in. wide, a foot high, and extended from just behind the foremast clear into the run. Their inside space made four large lockers, their tops were covered by 4in. thick cushions for seats, and being 12ft. in length, they made two good beds on each side, end on.

A bulkhead only a foot deep formed the finish of the foward part of the cockpit inside and the after limit of the cabin proper, and, being cut through at each end, it gave a long locker for guns, &c., upon each side of the cockpit, beneath the deck proper. Just below this, close up to the cockpit floor, the square 32gal. water tank was cased in, having a faucet in its anterior face. There was room beneath the tank and between the transoms for a goodly sized ice box, and the gangway steps covered all. The remaining space under the cockpit behind the tank was cased up and made a good locker upon each side, leaving a passage upon each transom alongside of the tank and locker, about 2ft. square, clear into the run, which was lighted by two bullseyes set into the deck. This admirable arrangement not only afforded lots of snug and warm leg room for the two after beds, but left the whole run open to the cabin for stores, sails, &c., without cutting an after hatch. The value of these lateral passages for storing bedclothes and overcoats, &c., temporarily during the day was incalculable, and the amount of camp equipage and stores that little Jack stowed in the run loaded a down-east truck team.

The stern was narrow and the overhang of cutter type, therefore the room behind the rudder post was tongue shaped. At the extreme stern lay a rolled shelter tent which Jack had packed in closely, yet I, a 5ft. 9in. man, weighing 165lbs., and a little stiff from rheumatism, crawled back upon the port transom with arm extended and succeeded in getting two fingers hold of the cloth and pulled it out.

The head room was 4ft. 6in., enough for any one to dress in, and one could also push back the gangway slide and extend his length and caput to the gale if he so desired. More would have been preferable, but when one reflects that it necessitates in such a single hand yacht a higher trunk and more surface exposed to wind and sea, an elevation of the main boom and sails, and an excursion-barge style, one will prefer a little genuflexion.

The store-room, kitchen and reception room having been considered, it only remains to describe the latter when fitted up as a bed room. The cushioned transoms were covered with bed clothes, hauled out of the run, two pillows were placed side by side across their middle, so that the sleepers should lie head to head; a short mattress was laid upon the floor, 2ft. 6in. wide, from the foremast aft, and another bed made upon it. This still left room at its foot for undressing, and the clothes were placed under the pillows to make them higher. Thus this little 25ft. vessel afforded ocmplete and comfortable hotel accommodations for five persons, and when one was kept on watch, for six—unprecedented in so small a craft. There were six on board during the cruise as far as Portland, and five during the balance of the season.

The hull was that of a beamy cutter, the rig that of a sloop. The sails were the jib, mainsail, gaff topsail, and spinnaker. There was a 26lb. working anchor with 20 fathoms of riding rope, and a 42lb. anchor with 30 fathoms of rope for heavy weather, and this latter saved us from going ashore and let us sleep in confidence many nights, for winds and currents are treacherous. A light 12ft. cedar boat towing astern completed our outfit.

Provisions and ship stores were all aboard and stowed; adieux were said; the mainsail was hoisted; the yacht ensign run up to the main peak, and the South Boston Yacht Club signal to the truck; the anchor was pulled up and catted; the jib hoisted; sheets were trimmed down, and, with three hearty cheers from all hands for E. L. Williams, the builder, who was taking notes of our appearance in a boat a hundred yards away we started down Massachusetts Bay August 20, 1885. The wind was light and sea smooth as we crawled past Deer Island, and up toward Nahant, and the four liberated school boys laid around upon the house and deck in the sunshine and resolved that going to sea in a yacht was one of the most delightful things imaginable. Off Egg Rock a skimming dish sloop crept up behind and was about to pass us, when the wind freshened and shifted so that both boats had to trim down flat on the port tack. Then we held our own and ate up to the windward till the skimmer was half a mile to leeward and about abeam. Then the wind died away and we rolled and slatted in a dead calm for two hours, when the wind came out to the eastward, striking our adversary first and giving her a good start, so that she led us into Marblehead, where we arrived and anchored off the Eastern Club House, at 5 P.M. Everything was made snug, the oil stove lighted, the supper started and we amused ourselves looking through the marine glasses at a lawn tennis tournament behind the club house and at the pretty cottages and villas along the neck. There were few yachts in port and nobody took any notice of our little craft and the colors proudly floating up aloft.

Nowhere outside of Massachusetts Bay did any club men show us the least attention, except at Portland, where two gentlemen not only visited us and tendered the hospitalities of the club, but took the trouble to send aboard their craft, bring aboard a set of charts and instruct me upon a difficult piece of water that I had to pass through in my voyage to the eastward. Bless them for their kindness and intelligent sympathy. I wish I could give their names here that they might be known the world over. I concluded after a while that my beautiful, English looking craft excited envy in the minds of club men, and our bold sailing, far beyond the limits of pleasure sailing for little fellows made them green with jealousy, so I did not hesitate to anchor under their noses and blanket them whenever I had an opportunity, and never expected any more courtesies.

An anchor watch was kept, because Marblehead is a rough place in an easterly, but the night was quiet, and the boys had their first opportunity of studying stars and stellar spaces. After the deck was washed down and the ship pumped, breakfast was eaten on the house, and then a stroll was taken through the town, where some hoodlums were disposed to make fun of blue shirts, belts and sheath knives. We returned aboard with some fruit and newspapers, made sail at 11 A. M. with a good wind from the S. S. E., passed Cat and Baker's Islands, and shaped our course for Eastern Point, expecting to go into Gloucester, but up with the point, the weather was so favorable, we kept on our way along the north shore. We saw what we supposed was Thatcher's Island, with its two high light houses, and kept on seeking to open a passage between it and Milk Island, on which of course lay along shore so that we could not separate it from the mainland. So we thought.

Suddenly we noticed that the light-houses were traveling over the island, or, in other words, were going to the right faster than the island, and then, looking at the chart, we were startled to find we had Milk Island on our starboard bow, covering Thatcher's, and were trying to run between it and the mainland directly upon the rocks. There is a passage through here for light draft vessels at high tide to those who know the way, but it is not safe for a stranger. Fortunately we were not too far in, and, by trimming flat down, we headed around Milk Island and soon opened the passage inside of Thatcher's where we found buoys and a clear channel. Thatcher's is a bold, rocky-shored isle with rather level grass land and two magnificent light houses, and the scenery opposite along the coast and up to Straitsmouth Island and around to Rockport is grand and imposing. The southeast sea beats upon the adamantine walls of rock that gird the sea coast with a sullen roar; great streams of water rush far into crevices and crannies, seeking further and further, as they foam against obstacles, to find some place to break the barrier, and then retire quickly to the advancing swell to recruit their force and volume for another attack; huge billows throw themselves against the massive ledges, as if to break them off, and then fly into great sheets of spray which send a rainbow coloring over the cliffs and cover the scant herbage with glistening crystals of salt. The beauties of our coast are rarely seen by travellers, because few indeed skirt along the shore in slowly sailing crafts and have the leisure and love of nature essential to enjoyment.

While admiring the situation and regardless of the shore being a lee one I heard an ominous gulp and noticed that Billy had a pale face and dew upon his forehead, and was holding one hand upon the rail and making profound obeisances and unsavory contributions to Neptune. The other boys were lively and inclined to joking, but I cautioned them to be charitable, for the time would surely come when they would be called upon to do homage to the great ocean sovereign.

We had a free wind after passing Oak Rock buoy, and kept away for Straitsmouth, passed pretty near the island and jibed over for Rockport—one of the blindest harbors upon the coast. A stranger must be careful here. There are several quarries and great piles of broken stone around Rockport shores, and it is very difficult to say where the little haven is. The shore is bold, and it is better to run along shore, coming from Straitsmouth, inside of Harbor Rock buoy until the narrow entrance opens out and the breakwater (merely a high ridge of irregularly piled stones) is seen to starboard, when one can run in boldly, keeping a little to port, and anchor rather close in shore in order to keep clear of the fishing vessels, which frequently seek a harbor here. This is not in the Coast Pilot and may be useful.

We poked along anxiously till we found the way, and arrived at anchor in the inner harbor at 5 P. M.—not a bad run for a small craft, from Marblehead in six hours. We went ashore for milk, bread and newspapers, had a good supper of warmed turkey, succotash, etc., of which our seasick boy partook heavily, and we laid quietly all night.

The sea coast near this place is not yet occupied by summer cottages, but it is one of the finest of any we found.

Rockport is a queer antique sort of a place, and reminded me of Marblehead as it was years ago. I guess there is about one train a day to Boston, which will wait a few minutes for a passenger if he sends word he is coming. The people probably get up very early and go to bed early, and the man who does not go to church regularly is regarded with suspicion. Some fishermen we met were very peculiar in dress and language, but were kind and ready to aid us when in trouble next morning with the anchor. Good holding ground? I should say so. We had down the 26lb. anchor and six men and boys could not start it. One of the oil coated fishermen helped us run out a line to a mooring, warp our craft over and beyond the anchor, and then get it by capsizing and hauling it from the stern. It took all our force even then.

We slept late and, when the anchor was up, it was 11 A. M., and a heavy shower was coming up black and ugly from the S. W., so we held on and took a heavy fall of rain, dryly housed in the cabin, a more preferable place than on deck at sea. Then we had a hasty lunch of tongue, bread and jumbles, and started at noon with a strong S. W. wind for Portsmouth.

[TO BE CONTINUED.]

CRUISE OF THE COOT.

VI.

IT was a pleasant morning near the close of November when the Coot slipped her moorings off Fort Morris and filled away for a voyage which promised to be eventful and novel from the manner in which it was undertaken. Other small boats may have voyaged down to Florida waters by the inside route, but none had left any record of their haps and mishaps, none had undertaken the long passage single-handed, and, above all, none had dared to face the storms and icy seas of midwinter. Neither would the Coot, had the terrible weather through which she passed been foreseen. Instead of the usual mild days of December, interspersed with occasional frosts, which the Coot had expected, she found frigid winter coming in butt-end first in such earnest that boat and crew underwent hardships far beyond what either would care to repeat. More than once it looked as though the enterprise would have to come to a standstill and the crew, crying "peccavi," lift sheet for home by rail, leaving the Coot at the bottom for good. Nothing but an ignominious ending to this log could have spurred on the skipper to accept and openly court risks which good sense urgently counselled against, and it is only by hairbreadth escapes that the relater is still in this tearful vale, though now happily below the dreaded ice belt of permanent winter.

With the last stores on board, the five-gallon breaker filled with water, and the crew rigged out in sea-going jersey, rawhide shoes and worsted cap, a last adieu was waved to those on shore watching her departure from the Knickerbocker Y. C. quarters. As sheet was given and the yacht swung gracefully away, the song from which she had tailed for several weeks seemed to heave a sigh at the loss it was about to mourn, for it bobbed down deeply in disconsolate fashion, suspecting that the Coot would soon cuddle up to strangers in its place. And that the faithless Coot did with a vengeance whenever the chance offered. Away from under her stern the rippling waters gurgled in sparkling wavelets, for the sun was shining bright and warm, the sky was clear, and nature laughed in her pleasantest mood. So different from the weeks just passed, when leaden clouds hung sullenly from the vault above, threatening vengeance to aught that dared show sail. The skipper congratulated himself upon the change which wreathed the aspect of things in smiles, and hoped that pleasant days might be in store to see him well along on the watery path leading to the balmy regions of the generous south and her open-hearted people. An almanac lay upon the cabin table with the month of November turned open. There, staring me in the face, at the top of the page, with marble eyes and stony glare, was a naked little wretch ankle deep in snow, trying in vain to warm the tip ends of his fingers in the wool-like flames supposed to proceed from a roaring log fire. Loosely gathered about his plump anatomy, a garment, for lack of pins and buttons, streamed out to the gusts supposed to be blowing from the north pole, while the background was filled with portentous clouds rolling heavily along. This, then, was typical of November. But my November, as a matter of fact, was more like spring, and I laughed at the chilly little urchin and his futile efforts to stay the cold at a log fire, instead of slipping on shoes and pantalettes and clove-hitching that flying blanket about his chubby loins. In charming weather it was that the Coot set out upon her voyage, but alas, as this tale will tell, the almanac was only too near the mark, and my bright hopes were destined soon to be shattered.

Much still remained to be done aboard the yacht to render her a fit vessel for the dangers sure to be met. A score of trifling things still needed attention. A little caulking here and there, a few new cleats, a new peak block, reef nettles in the third row of holes, locker doors each side of the cockpit, a mast coat, painting inside and out and numerous other odds and ends, all of which were deferred to that indefinite period "when weather," which was confidently expected but which has not yet come. And for want of perfect preparation, the yacht and her crew suffered accordingly, for the most trifling omission may assume in critical times, a gravity out of all proportion to one's expectations. Thus it happened that a wretched contrivance in the way of mast bitts for belaying the gear nearly cost me a capsize, and always gave me anxiety. The bitts were so small that a turn or two with the halliards filled them up and gave no chance for a half hitch which would hold. To see the halliards come down and the gear forward in inextricable confusion became the order of the day. For riding to her cable, the Coot relied upon her stem head as a bollard. But the head was tapering and the hitches would slip off in a sea with the likely loss of the ground tackle. Fortunately this had been foreseen and the "bitter end" of the cable was made fast around the mast. When I got a chance I drove an iron pin through the stem head, a simple provision which remedied the defect. There was not a cleat or cavel about deck forward. Nothing but a ring for the painter.

The shabby equipment of the Coot, common to all small American yachts, placed me in sore trouble, and nearly lost me the boat on one occasion, of which this log will speak further on. The tiller, like all tillers, was a rambling fit in the rudder head, and would jump out at odd times. It was lost in a heavy gale, when disaster stared me in the face, and would have put an end to boat and man but for the presence of an old stick, which was made to do duty instead. The rudder had no "lock," and frequently jumped out of the lower gudgeon. It played me that trick in the Delaware River, and drove me high and dry ashore for twenty-four hours. The rudder stock was too small for the hole and wore itself away about the deck collar, thumping frightfully all night in a sea way, so that sleep was next to impossible. The blocks were all too small for the gear, a crazy hobby for "neatness" aloft obtained at a sacrifice of common safety. The sail had to be got down by might and main, and often that would fail to snug down the canvas. The boom would shin half way up the mast, so the luff could never be kept on a stretch, nor the yacht pointed as she ought to go. There was neither shoe nor strap underneath the keel. Frequent grounding had chewed away the wood nearly up to the garboards in places. This I proposed to look after in "warm weather" by outlying the chafed sections and inserting fresh oak pieces, and also adding a hard oak shoe before and abaft as a protection to the main keel. And so on through dozens of other complaints which might here be cited to show the wretchedly inefficient condition in which small yachts are delivered by the builders, whose only aim seems to be to pass off upon beginners a hasty job, half finished in some of the most important details, at consequent risk, even the imperilling of life.

This leads up to the suggestion that our yacht builders, honest enough though they be, have, as a rule, so little experience in yachting life that they cannot be trusted with the outfit of a vessel which is to be put to real service instead of horse play in the Sound or Great South Bay. For the Coot was no worse than a thousand similar boats which are vainly supposed to be very near perfection and whose builders would scout the idea of any deficiency existing. What can a sailorman think of a builder who supplies no means at all for securing the anchor on deck, not even as much as a cleat, and whose rudder unships in a little jump in a river, and whose sail cannot be hoisted to a taut luff or reefed close enough for a hard blow? And if builders are such lubbers that they cannot appreciate the simplest necessities of actual service, who else can the novice look to for advice and supervision in such matters? No wonder that sailing in small yachts in America is still deemed foolhardy adventure instead of growing into common practice. So far as the diminutive size of the Coot is concerned it has never yet been a serious objection to the cruise I have set out upon, but in her slovenly fittings and absence of decent equipment I have discovered such imminent danger that none should attempt to follow in my wake without overhauling their boats in every respect at the instigation of some one competent to supply the omissions. The principal yacht builder in New York at this day is utterly without yachting experience, and but for a few cruises made as a boy in a square-rigger has no claim to rank as a sailor, while the small fry who beget such boats as the Coot can scarcely feather their oars and are not conversant with the rudiments of the art for which they presume to supply the tools. In all the troubles which I have so far met, the want of knowledge, foresight, and care on the builder's part, have been the chief contributing causes, and but for the fact that I may be ranked as a pretty old hand at the business, disaster would have wound up my career ere this with the builder justly chargeable as a party to manslaughter. Yet none of the provisions to which I refer are items of great cost or much labor, for they merely represent contrivances, which, if small and obscure, are none the less essential to the safe management of a boat than the frame and fastening to her strength and lease of life.

To a light westerly breeze the Coot slipped through the water with the last quarter of the ebb horsing her down through Hell Gate, where a board had to be made to fetch clear of the tall electric tower on Hallet's Point, looking for all the world like a skeleton on stilts. Then, with sheet pretty well in, she pointed fair through the western channel along Blackwell's Island and into the East River. The wind was here exceedingly baffling. It came out now and then in strong puffs as if swept down upon the little Coot through the city gulches lined with brick and brownstone houses, then again it would fall entirely and leave the yacht with scarce steerageway, bobbing up and askew to the nasty cross swell kicked up by passing steamers and thrown back upon itself from piers and seawall close aboard. The outlying reef to the southward of Blackwell's Island was cleared on the last of the lee-going tide, and by dint of coaxing to occasional whiffs the boat was tooled along in the slack, by the huge soot-begrimed sugar factories on the Brooklyn side, after which the first of the flood had to be stemmed. Through a maze of ferryboats a devious passage was tediously forced until after drifting astern and forging ahead a dozen of times the Coot's mast was at last brought plumb under the huge flying span of the suspended structure which unites two great cities in the bonds of municipal sisterhood. A lumbering smack had just passed through the bridge a few lengths ahead of the Coot, and, catching a breeze of great strength, was soon away for Buttermilk Channel. But no such good fortune was in store for the Coot. She failed to pass the massive granite towers, and hung pertinaciously beneath the maze of girderwork and roping. After many a futile dart ahead she was obliged to succumb and drift helplessly astern with the flood. For three long hours had the yacht vainly striven to drive through. The Catherine Street ferry had commenced running again, and the Coot's maneuvering had all this time been right across the bows of the double-end side-wheelers, whose passengers crowded to the rail to watch the yacht in her tireless toils. Her bright yellow house and her lone crew with forlorn mien had become familiar marks of recognition to the steamers pilots, whose whistles were each time repeated with additional vigor as the annoyance to them grew more intolerable. But one and all managed to give the Coot a good berth, till at last patience was exhausted to the wheel of one ferryboat, whose captain sung out in a derisive tone: "You can't do nothing on this here tide. What are you bothering us in this fashion for? Better come to and wait for the ebb." He delivered his speech in a deprecating tone, as he took me for one of the many holiday sailors, who wilfully, or through lubberly tactics, make themselves a nuisance to the ferries in the East River. I had come to the same conclusion some time before, but in my anxiety to make an anchorage for the night off Staten Island, had bucked away at it longer than good judgment should have counselled. Indeed, it is at all times a thankless job to attempt beating a light, small boat against a tide of three to four knots' strength, and when the wind backed ahead, the Coot should have given it up at the outset. So helm was put up, boom eased away and the yacht run into Navy Yard Bay, where the Chester folding anchor was hove overboard for the first time in something like eight fathoms of water. The anchor nipped at once and appeared to catch a powerful hold, which impressed me favorably with its capacity. Subsequently I found that it would not serve as well in soft bottom, at least not in a blow, for it came right home to a slight pull on the line. For sand or hard bottom the sharp narrow arms without palms stood in good stead, as the anchor would quickly pry into the bottom. For mud and slime the arms lack enough surface. In such bottom I was obliged to trust to the 25lb. anchor of standard shape and that held the Coot in the softest of ground, through gales of great force accompanied by sea. Possibly a moderate broadening of the fluke ends might improve the Chester anchor so as to serve in all cases. For stowing in the cockpit or on the cabin floor, it is very convenient. An elongated palm slightly hollowed might be made to fay snugly against the shank, even if one palm would overlap the other to that end. They could be on a skew to that extent without impairing efficiency, as one of the palms of my ordinary anchor had been bent to twenty-five degrees without in the least interfering with a tight grip in the bottom.

Although high water was announced for 3 P. M., the flood continued o pour up the East River till 7 P. M. Long before that time patience had ceased to be a virtue, and the yacht was got under way. She drifted up river and down several miles of ground through being in too great haste. All the obnoxious work through the Grand and Houston street ferry with the Hunter's Point, Greenpoint and Roosevelt ferries thrown in, had to be gone through a second time and even a third time, till it appeared as though the Coot had become a fixture in their waters for all winter. Why did she do this useless knocking about? Because the wind would play the deceiver, blowing at one time from a favorable quarter, and with backbone enough to raise hopes of going through, only to settle again in the south and then fall away the next moment. It had been growing dusk. Lights, stray ones, here and there feebly glimmered through the haze of the evening. As it gathered into night they shone out brighter and brighter, while innumerable others sprang into being all around to cheer me up with their company. The brilliant line of piercing electrics arched in graceful sweep along the carriage way of the bridge melted the darkness about and poured a flood of silvery rays upon the heaving tides beneath Red lights, green lights, flickering flashes all about tumbled and danced in gleeful reflections. All was aglow, all looked happy, all pulsated with life as far as the eye could reach. Overhead, the deep blue dome was pierced with sparkling, winking little dots and myriads of pinpoints massed into the unfathomable mysteries of the Milky Way. Yet in all this radiant scene there was one dull, sombre object slinking along in stealthy gloom, carrying one disgruntled being as an offset to the joyful fringe surrounding. It was the Coot and her crew. Neither sidelights nor a ray from the cabin lamp shot forth to announce her inert state to passing vessels. While twilight's last moments still lingered, hope had not quite gone out, and the yacht was kept to her task, without accomplishing a fathom ahead. Back and across the river she stood, gaining a few inches to lose them on the next fling off. When night closed in earnest, an uneasy feeling overcame the crew, and, conscience-stricken, he argued, this sort of thing won't do. Boxing about the East River at 9 P. M. and not a match touched to wick was recklessness itself among the ceaseless travel of the ferryboats and working vessels suddenly cropping up end on, gliding noiselessly, swiftly by, with neither suspicion of the Coot's existence nor notice of her whereabouts. Tired out the skipper certainly was, and sorely disappointed he would have been at the smallness of the first day's results, had he not realized that many like failures would have to be accepted throughout the voyage just begun.

The Coot was slowly swung into her former anchorage abreast of Uncle Sam's old hulk, the ancient line-of-battle Vermont, whose yellow-daubed sides stood out in bold relief against a gray pack of rusty men-of-war out of commission moored inside the Cob dock. Once more the Chester was tumbled off the bows into deep water and its splash gave a period to the first day underway. Sail was stowed and a riding light lit just as the ebb showed first signs of birth, too late to be of any service in my behalf. With light in hand I proceeded on deck, when suddenly a grim phantom hove in sight close on the Coot's quarter. On and at me it rushed like a ghost. A long spar-like jibboom was poked nearly over the rail, then a jeer from the hand at the wheel was thrown aboard as a lumbering schooner was eased away just enough to clear my boat's side. "Say, Cap, got a bad place to stay there all night." This was cold comfort. A whole fleet of vessels bound South followed in the latter's wake, working the eddy in Navy Yard Bay, and gave me much uneasiness for my little cockle shell with her faint glimmer of an anchor light. As matters could not be mended by shifting for another and possibly more dubious berth, it was resolved to remain right there and keep a sharp watch on the anchor light throughout the night. I turned in for a cat nap with one eye open. Just ten minutes or so before rousing out for the first look around, such was the firm resolve.

When I awoke daylight was streaming in at the cabin windows. The Coot was still afloat, I was still alive and the Vermont's brindle coat shone forth in the morning sun with a feverish intensity which suggested warm and pleasant days which had flown. C. P. K.

STOVES AND CHARTS.

Editor Forest and Stream:

This is the time of year when, the pleasures of the summer being over, we live them again beside the stove and in all probability enjoy them more in the telling than in the doing. It is also the time for overhauling and adding all those little kinks which are so small in themselves, but so great in the comfort they give.

"Piscator," in your last issue, relates his experience with stoves. He is evidently a man after my own heart, and I should like to know him. I think, however, I can teach him a thing or two with stoves. After trying nearly everything in the market, I have at last settled on a benzine or gasoline stove (now, don't all pitch into me at once, for gasoline is not half the terror it is supposed to be), and, as it is a gem in its way, it will stand a description. It is what is known as a plumber's pot, used for heating soldering irons, and it will heat an iron red in six minutes. There are several forms of these pots made, most of them of tin. They are unusable for boats on account of liability to breakage, when the oil would escape and might prove dangerous. Mine is of cast iron, every opening to which is closed with a cast iron plug. When lit it can be upset and rolled around any number of times without either going out or danger of setting anything else on fire; and as it weighs twenty pounds, nearly all of which is near the bottom, it is firm on its feet. The oil is forced to the top through a syphon by compressed air, the air being compressed by the bulb of an ordinary syringe attached to the casting. The flame produced is blue and entirely without smoke. It is regulated by a stop cock the same as an ordinary gas fixture. It cost me only $5 complete, and burns two quarts of either benzine or gasoline in twelve hours' burning.

Now, there is Mr. Kunhardt. The idea of a man, usually so practical, fixing his charts in such a half-way fashion as he speaks of in his "Cruise of the Coot." Take, for instance, the coast chart containing our own New York harbor, the Upper Bay is nearly in the center of the chart. If he cuts this chart into quarters, he divides the bay. So in using any quarter he can only get bearings on one side of the bay, and should he want to tack across he would have to get out another quarter. If, now, instead of using an ordinary frame to hold the quarters he uses a frame with two glasses, putting in two pieces of the chart back to back, he has only to turn the frame to see the other side of the bay; and in running a coast line, by putting in the adjoining sections only one-half the number of changes need be made. In single-handed sailing, where one's hands are apt to be full, this is quite an item. W.

New York, Dec. 21.

THE ALTERATIONS IN THE SEA GULL.

Editor Forest and Stream:

In your issue of Dec. 10, 1885, I notice a communication headed "Notes from the Delaware," in which the writer of the article criticises the yacht Sea Gull, and attempts to support these views by statements which are incorrect.

As the planning, building and subsequent development of this yacht represents the actual practical experience of a Corinthian yachtsman, with a definite object in view—to obtain a compromise between the keel and centerboard types—and the boat has had some notoriety from being the only yawl rigged yacht on this portion of the coast and the Delaware for some years, besides her rather exceptional experience at sea, I deem it but just that a true history and statement of facts be presented.

The yacht Sea Gull was built some years ago on the Atlantic coast by the writer as a single-handed cruiser. The yawl rig was originally decided upon, the owner having had some personal experience with it in previous years. The length of the yacht was 25 feet over all, 22 feet 6 inches length of keel, 9 feet 5 inches beam, draft at bow 1 foot 6 inches, aft without board 2 feet 9 inches. A heavy keelson and keel, hard woods, copper and galvanized fastenings were used in her construction.

The definite stipulations were safety, room, stiffness, small draft and handy rig. The cruising ground was a dangerous coast, the daily running over the bars of inlets. During the first year after she was built she was catrigged for work in the narrow channels along the New Jersey and Delaware coasts, for which the kind of a rig is remarkably well adapted, but for a heavy seaway the catrig is utterly unfit owing to the weight of the mast in the eyes of the boat, and also the difficulty of managing the large sail and boom. Late in the summer of this first year the owner sailed her single-handed around from Atlantic City to Camden, where he equipped her according to the original plan as a yawl. The next four seasons, with one of my sons, and part of the time with my wife and little daughter, was spent on the coast, where her seagoing qualities were thoroughly tested. On one occasion we rode out a northeaster off Cape May. From experiences of this kind it was decided that an increase of freeboard would add materially to her good qualities. In 1882 she was raised about 14in. by Mr. James A. Collins, of Cooper's Point, Camden. During the year 1883, with almost constant cruising from May until late November, and April and May of 1884, the yacht's performance under every condition more than satisfied me of the advantages of the increased freeboard.

Allow me now to notice the statements of your correspondent, which are quoted verbatim: "It was this excessive freeboard that caused her to founder at sea. I doubt very much if this would have occurred in her normal condition."

This assertion is untrue, and has probably been taken from some of the many exaggerated reports published at the time in the newspapers. The following simple story of the yacht's experience will prove her weatherly qualities through a gale of remarkable violence, when a three-masted schooner went down with all on board not far from her.

The Sea Gull, under reefed mainsail, jib and mizzen, left Chincoteague early Wednesday morning, June 25, 1884, the wind blowing a stiff gale from the south. At about noon, when off Isle of Wight Bay, half way to the Capes, the wind suddenly shifted to the south by east without warning, and was soon blowing the worst gale experienced on the coast for years, and soon there was an ugly cross sea. The yacht wore off shore, when the mainsail was carried away. However, she worked well under storm jib and mizzen, but several seas coming aboard when attempting to lay to, her jib and mizzen were torn from the bolt ropes. A top-heavy boat would have been rolled over then and there. Fortunately, a sea drag had been rigged of spare spars, sail, the cabin steps and a fifty-pound anchor. This was hove over the bows with about thirty fathoms of hawser. This brought the yacht's head to the seas, when she rode comparatively easily. While running off the coast, the seas that came aboard filled the cockpit, but having four scuppers it was emptied immediately. The cabin doors being water tight, the cabin slide and skylight having been battened down, no damage was done. About 3 o'clock on Friday morning the rudder was carried away, having been strained probably at Chincoteague. At daylight a large steamer was sighted, the Richmond, Capt. Crossman, riding to. The storm showed little or no abatement, the two on board the yacht were much exhausted, the sails and rudder were disabled, and it was decided to abandon her. After considerable danger and difficulty, they were taken off by the steamer's cutter.

When last seen on Friday evening the yacht was riding to her sea anchor. On Saturday morning, June 28, the British steamship Kinsale found the Sea Gull riding to her drag, twenty miles from Cape Henry. She took her in tow to within five miles of the cape and there abandoned her, after apparently having stripped her of running rigging, cabin furniture, guns, watches, money and other personal property. July 1 the pilot boat Wm. Graves, of Norfolk, picked up the Sea Gull near Cape Henry and towed her into Hampton Roads uninjured, with the exceptions described.

Quoting again from your correspondent, "With so much weight above her loadline and so little below, it became necessary to place iron outside on her keel. This, from her flat round form, did little or no good, and again the doctor is called upon to save his patient." This statement is incorrect. In the first place, all past experience has proved her to be remarkably stiff. Her iron ballast for years has always been stowed and clamped down along her keelson on her timbers, and when several tons were added to since it was first put in. But to my mind there are great objections to movable ballast. The trim of a vessel, large or small, is everything. Great care is often required in the proper adjustment of the ballast. When unshipped, as it always should be when laying up in the fall, it is very troublesome to get her into trim again in the spring.

Again the difficulty in keeping the run clear, a most important precaution where weeks are spent on board. In the third place the loss of valuable storage room for articles not hurt by dampness. With an iron keel outside, properly bolted through the keelson, the distribution of weight carefully calculated, the writer prefers this mode of ballasting. In the second place it would not be an advisable mode of doctoring for "too much weight above the loadline," "to add a long sightly fantail" which has been done at this date.

The "respectful suggestion that the yacht be lengthened 5ft. forward, with long easy curved lines," is a good one, but not original with your correspondent above quoted, as it was part of a plan, discussed, drafted and decided upon nearly two years ago. The benefit of the last suggestion, and this I grant is original with your correspondent, "that during her doctoring it would not be a bad scheme to sink her down and make her, at least 2ft. deeper in the submerged body." This is respectfully declined, as it would completely unfit the yacht for the work for which she was designed. This principle in the doctoring of yachts is too often overlooked by the partisans of both the deep and the shallow types. Sea Gull.

Philadelphia, Dec. 15.

YACHTING IN CANADA.

WHILE there is not much likelihood of any probable additions of much note to the yachting fleet in the province of Ontario for next season, the sport has suddenly taken a fresh lease of life at the city of Quebec, in the province of that name. The ancient capital several years since possessed an excellent fleet, prominent among which was the centerboard sloop Dauntless, which was purchased by a company of gentlemen in this city in 1874, and has for the past four years been owned by Mr. David Pitreathly, ex-coumodore of the R. Q. Y. C. Yachting went out of fashion at Quebec, and for several years there was no organization among its yachtsmen; but last winter an effort was made to revive the sport, and in February a number of yacht owners sought the aid of Mr. J. U. Gregory, of the Marine Department, in establishing a yacht club in Quebec. This movement resulted in the formation of a yacht club with a membership of forty, which during the year has increased to over 200, with a fleet of thirty yachts. The first race of the season was for prizes given by the Marquis of Lansdowne, patron of the club, and was won by Curlew, Mr. Ritchie, and Guinevere, Mr. Peters. The second race was for prizes given by Com. Gregory and Vice Com. Ritchie, won by the Osprey, Messrs. Thorn and Shaw. The third race, for the club cup, was won by the Iris, Messrs. Grant, Peddington and Heatherington. Several new yachts are now building for next season. The L'Hirondelle, 47ft. over all, is building by P. Jobin for Com. Gregory. She will resemble the Dauntless in model. Mr. Leunbeux is also building a deep yacht, and a 30-tonner is building by Wiseman for several owners.

Belleville, Ont., Dec. 23. Port Tack.

DONALDSON'S "STEAM MACHINERY."—We have received a number of inquiries of late as to some text book on steam launches, and as the only popular treatise on the subject we would reccommend "The Practical Guide to the Use of Marine Steam Machinery," by James Donaldson. The author commences with a short notice of marine engines and with general instruction as to running of machinery. Preliminary preparations, filling the boilers, lighting the fires, oiling, running, laying up, etc., are described in detail; then the author takes an ordinary steam launch as an example, and describes the boiler, gauges, valves, eccentrics, etc. The third portion of the book deals with engines and boilers of various kinds, indicators, injectors and propellers, following which are descriptions of a number of small steam vessels, with full specifications for hull and engines, of an iron launch 65ft. long. The book is extremely practical and contains much valuable information. It can be had at this office.

OIL ON WAVES.—The following account of the use of oil in a heavy sea is given by Capt. H. B. Conby, master of ship Slieve More, in a late issue of the *Nautical Magazine*: "My ship, the Slieve More, outward bound to Bombay with coal, was burnt June 16, 1885, in lat. 2° 40' S., 63° 40' E. We were many days in the boat. On the 18th, 19th and 20th we had a heavy gale from the S. W. with a terrific sea. I never thought boats could live in such weather, and I believe ours could not have done so if it had not been for the oil we had with us (nearly 20 gallons). The boats were hove to for 60 hours, having a good sea anchor of boat sails securely lashed to mast and oars, which formed an admirable breakwater, spare oars, manned, helping to keep the boat end on to the sea. Oil (paraffin) we kept constantly dripping from a tin at the bows, and from stockings lashed to boat hooks, the effect was marvelous. As the boats slowly drifted before the gale and seas, the oil spread and was always ahead, and out past the drogue (which was reeved ahead of the boat about 10 fathoms), leaving a smooth lane and completely preventing the waters from breaking, though, of course, not lowering their height. It was a wonderful sight to see the turmoil of waters on each side of this smooth lane; the seas rushed past with a roar and great white tops breaking astern. The use of a long steering oar helped greatly to keep the boat steady. Boats kept company for four days and nights, each boat hoisting a light by night. Eventually we all reached the Seychelle Islands in good health, my boat having been picked up by a coasting brig."

A NEW GAS ENGINE.—The N. Y. Petroleum Gas Engine Co. have erected a handsome two-story factory at Brown place, mouth of Kills, Harlem River, adjoining William Kyle's boat shop. They will manufacture engines for steam launches, under a patent covering many novelties. Briefly described, the machinery for a 17ft. launch just completed is as follows: At the bow of the boat is a tank containing eight gallons of benzine or naphtha. This tank is connected by two pipes with the engine, which is in the stern. All the working parts of the engine are inclosed in a small iron chest. There are three cylinders: one used to pump the benzine to and from the tank, and two to operate on the propeller shaft. Above the chest is a small stack wherein is a coil of pipe containing benzine, which is vaporized and used in the cylinders, after which it is condensed and returned to the tank. To start the engine it is only necessary to pump a few drops of benzine on a suitable mechanism at the bottom of stack, apply a match, and in one and a half minutes enough power is obtained to start the yacht. The whole thing is so simple that any one can run it after ten minutes explanation. There is no dirt from coal or oil about the machinery. It is extremely light, and occupies only the two ends of the boat, thus leaving the middle body entirely clear for passengers. The hulls of the boats will be built by Mr. William Kyle. For small cruisers, yawls for yachts, it is likely these yachts will become very popular.

GERMAN RACING RULES.—Under the title of "Racing Rules," the *Ahoi* has issued a neat little volume bound in enamel cloth, containing much of practical value to yachtsmen. It contains a table of allowances calculated for the varying strengths of the wind, under four different systems; waterline length, the length and beam multiplied; the sail area and sail tons, sail area multiplied by length and divided by 170. A number of interesting subjects are also fully treated of; measurement, regatta committees, conditions, programme, classification, entries, prizes, courses, sailing rules, etc. The book concludes with tables of weights, measures, specific gravity, etc. It cannot fail to be most useful to the German yachtsman.

THE PURITAN'S CUP.—In accordance with the resolution passed on Oct. 22 by the New York Y. C., a handsome piece of silver has been prepared for presentation to the owners of the Puritan, and was exhibited at the meeting of the club last week. The cup is of solid silver, 22 inches high. On one side is the figure of a workman, in Puritan dress, examining a model of a yacht, which model is a miniature of the Puritan. The inscription on the other side reads: "Presented to the owners of ye Puritan by the New York Yacht Club, in commemoration of her victory over the Genesta, representing the Royal Yacht Squadron of England, in the match for the possession of the America's Cup, sailed September, 1885.

THE GREAT EASTERN.—This famous vessel has been sold in England for £26 300 to be used as a coal hulk at Gibraltar. She will take out a cargo of coal and will anchor permanently at Gibraltar, her supply being kept up as it is exhausted.

CARRYING PETROLEUM IN BULK.—In the United States, where wood is plenty, oil is mostly shipped in barrels, but in Russia the scarcity of wood makes it necessary to ship in some other form. For some time steamers in the Volga and Caspian have carried oil in bulk and three new steamers are building in Sweden for a similar use in the Black Sea. The first one completed, the Svet, will be 282ft. long, with 12 compartments for oil, each with a separate pipe. It has been proposed to build similar vessels for the English trade, but Lloyds as yet refuses to classify them.

A NEW SCHOONER FOR THE DELAWARE.—Dr. W. H. Vallette of Philadelphia, is now having built a schooner yacht 67ft. on deck, 20ft. beam, and 6ft. draft with 5 tons of lead on keel. Mr. A. E. Smith of Islip, L. I., is building the yacht which is now in frame. Laid up at Islip are Mischief, Schemer, Theresa, Fanny, Sagitta, Mystery, Vixen and Caprice. Schemer will have a new deck and tops, also new garboards.

ELECTION OF OFFICERS.—Hudson River Y. C.: Commodore, J. E. Drew; Vice Commodore, William Arndt; Secretary, E. R. Wilson; Treasurer, R. V. Freeman; Steward, J. T. Hufnagle; Trustees, J. Stilger, S. Bridge, L. Wolf, J. L. Kreymer and J. Reisenweber; Finance Committee, M. O'Neill, W. S. Page and L. Wolf.

CARMELITA.—This schooner has been on the screw dock for survey, having been purchased by Mr. Henry Belknap, N. Y. Y. C.

OSWEGO Y. C.—We have received a handsomely printed invitation to a reception of the Oswego Y. C. on Dec. 29.

BRUNHILDE.—Mr. Phelps' schooner was reported at Aden on Dec. 8, having passed Perim on Dec. 6.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

Q.—The trajectory report will be printed in pamphlet form.

G. M. F.—From 180 to 200 pellets in a 30-inch circle at 40 yards.

St.—You cannot get any ducks at this season in the region named.

H. B., New York.—You will find deer within a day of the town in Virginia.

J. Q., Maine.—Muskrats should be trapped in February rather than November.

T. M. D.—You may get the pedigree by addressing the club at Babylon, N. Y.

D. R. P., New York.—Try Mayport, Fla., at mouth of St. Johns River for winter fishing.

J. H., New York.—You will find sea fishing at Beaufort, S. C., where there are good hotel accommodations, boats, etc.

A. W. B., Philadelphia.—The atlas contains several maps and plans of Barnegat Bay. We can furnish "Luce's Seamanship."

W. S. L., Niagara.—Would it hurt a gun to do away with the inside shoulder in the chamber? Ans. No, it might be an advantage.

Eaton, Johnstown.—The gauges of shotguns measure as follows: 8-bore, .860 inch; 10-bore, .793 inch; 12-bore, .750 inch; 14 bore, .715 inch; 16 bore, .685 inch; 20-bore, .627 inch.

M. H. B.—You can buy the gun through any of the large dealers, whose advertisements are given elsewhere. If the firm you apply to do not have it in stock they will procure it for you.

Rabbit, London, Ont.—Around this part of Ontario we have the little cotton-tail rabbit, and a larger kind we call hares; both have the brown coat. I have seen both on the same day and as late as Christmas, when there was deep snow on the ground for several weeks before. We have also the white hare here, but have not noticed them around before February or March. Are these different rabbits, or does the large kind change its coat after the 1st of January? Ans.—The cotton-tail (*Lepus sylvaticus*) is a hare different from the common American large hare (*L. americanus*), which changes the color of its coat in the spring and fall. A third species is the great northern hare (*L. timidus*, var. *arcticus*).

J. H. P., Norristown, Pa.—Gentry's "Nests and Eggs of Birds of Eastern Pennsylvania" is more than anything else a catalogue, and gives little or nothing on the habits of birds. Coues's Key is what you want.

C. B. S.—1. The interior diameters of shell and barrel are the same. 2. We have not the measurements at hand. You can procure the shells at the gun stores. The shoulder should be equal to the thickness of the shell.

L. O. B.—Go from Savannah by steamer and stop at a "likely" place. The steamer David Clark makes two round trips from Savannah to Brunswick and back each week and touches for freight and passengers at St. Catherine's Island, Doboy, Darien, Broughton Island, Wright's Island, Cathead, Grantley's Wharf, Battery Island, Chapman's Wharf, Frederica and St. Simons. You can readily change ground if not suited.

Harrisburg, Pa.—I wish to have a gun built, and am unable to state what pattern would be best to order. Will you please answer the following questions: For a 12-gauge, 7½ pounds gun, with 30-inch barrels, loaded with 3½ drams No. 4 Hazard's duck, one No. 11 Baldwin card and two No. 11 Eley's pink-edge wads over powder; 1 ounce No. 9 Tatham & Bros.' drop shot, one No. 12 Baldwin card wad over shot, right and left barrel at 30yds., 30 inch circle, the same with 1⅛ ounce No. 6 shot at 40yds., and the same with 1¼ ounce No. 3 shot at 50yds., what would be the best pattern for an all round gun in the hands of a pretty fair marksman? Ans. From 180 to 200 pellets.

POT LUCK FROM EXCHANGES.

A half-breed Indian in the Dead River region in Maine has domesticated a huge moose, and uses him in the farm work. In the winter when the moose is hitched to a sled and is driven upon the ice, there is no horse in the country round about which can keep up with him. The half-breed turns his big steed into an inclosure with a fence of ordinary height. Once in a while the moose jumps out and goes on an excursion, but as he never fails to return, this privilege is not begrudged him.

Suspicious Circumstance.—Sam Johnsing has been suspected of stealing dogs in order to obtain a reward. A conversation with Judge Pennybunker encourages the idea that he is none too honest. "Ef a man was ter steal dat fine pointer dog ob yourn, how much reward would you gib ter get him back, Jedge?" "About five dollars." "Boss, gimme four dollars and I jess luff that dog alone. Dem am special rates which I ain't offering de general public. Dar's a circus acoming, and I'se got to hab money."—*Texas Siftings.*

A Significant Procession.—At Minnewaukan I saw a long procession of Red River carts, loaded with buffalo bones, and driven by Chippewa Indians and half-breeds, who had come from the Turtle Mountains, about seventy miles distant. Some of the carts were drawn by ponies and some by oxen. The drivers of the oxen walked in front of their teams, instead of beside them as white men do, and coaxed the animals along by constant motions of the whip. How did a band of Chippewa come to occupy the Turtle Mountain country, which lies far west of the old hunting grounds of their ancient enemies, the Sioux? This is an interesting question which could be answered by the Hon. H. M. Rice, of St. Paul, who is the best living authority on the history of the Chippewa or Ojibway tribe.—*The New Northwest.*

Failing Powers in Middle Age are best provided against by an endowment policy in the Travelers, of Hartford, Conn. Lowest cash rates.—*Adv.*

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the eld of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.
VI. Keel Catboat Caprice.
VII. Caprice—Sail Plan.
VIII. Keel Catboat Dodge.
IX. Catboat Dodge—Sail Plan.
X. Open Boat Cruiser.
XI. The Cruiser—Sail Plan.
XII. Open Boat Trident.
XIII. A Skipjack.
XIV. The Centerboard Sloop Gleam.
XV. Gleam—Sail Plan.
XVI. The Centerboard Sloop Midge.

XVIII. Mignonette—Sail Plan.
XIX. Single-Hand Cruiser.
XX. Light Draft Cutter Carmita.
XXI. The Dart.
XXII. The Boston Sloop Neva.
XXIII. The Boston Sloop Nyssa.
XXIV. Keel Sloop Columbine.
XXV. Columbine—Sail Plan.
XXVI. The Keel Sloop Alice.
XXVII. The Gannet.
XXVIII. A Compromise Sloop.
XXIX. The Itchen Cutter Daisy.
XXX. Daisy—Sail Plan.
XXXI. The Cutter Vayu.
XXXII. The Cruising Yawl Windward.
XXXIII. Windward—Accommodation Plan
XXXIV. The Windward—Sail Plan.
XXXV. The Cruising Yawl Aneto.
XXXVI. The Single-Hand Yawl Deuce.
XXXVII. Deuce—Sail Plan and Construction
XXXVIII. The Cutter Petrel.
XXXIX. The Petrel—Sail Plan.
XL. The Cutter Merlin.
XLI. The Merlin—Sail Plan.
XLII. The Cutter Rajah.
XLIII. The Cutter Yolande.
XLIV. Yolande—Cabin and Deck Plans.
XLV. A Single-Hand Yawl.
XLVI. Single-Hand Yawl—Cabin and Deck Plans.
XLVII. S. H. Yawl—Rig and Construction.
XLVIII. The Cutter Mamie.
XLIX. The Mamie—Midship Section.
L. The Mamie—Sail Plan.
LI. Six-Beam Cutter.
LII. Six-Beam Cutter—Sail Plan.
LIII. The Cutter Surf.
LIV. The Cutter Surf—Sail Plan.
LV. The Cutter Surf—Midship Section
LVI. The Cutter Surf—Cabin Plans.
LVII. The Cutter Spankadillo.
LVIII. The Cutter Madge.
LIX. The Madge—Ironwork.
LX. The Schooner Gaetina.
LXI. The Nonpareil Sharpie.
LXII. The Cynthia.
LXIII. The Cruising Sneakbox.

A folio volume (size of page 14½x12½ inches), printed on paper specially manufactured for it, and with great beauty of execution and finish in every detail, making a volume vastly superior to any other work of the kind ever published. Pages 370, with 136 plate pages additional, or a total of more than 500.

PRESS OPINIONS.

New York Times, Nov. 1.

The author, Mr. C. P. Kunhardt, is well known to all yachtsmen through his writings in behalf of better boats and a higher standard of skill while in charge of the yachting department of Forest and Stream, and his hearty devotion to the sport, backed by a thorough scientific training, fit him peculiarly for the task he has so well accomplished. The conception of the work is a happy one; the subject is treated plainly and practically; fine spun theories and elaborated calculations are omitted, and only such results are given as will be useful to any intelligent yacht sailor or builder.

New York Evening Post, Oct. 24, 1885.

This book fills a blank in American yacht literature, and will be found a valuable addition to the libraries of our American yachtsmen. The subject matter, although covered in a measure by such works as Dixon Kemp's "Yacht Designing" and his "Yacht and Boat Sailing," is presented in more attractive form, is much condensed, and is procurable at less than half the cost of these volumes. It is practical throughout—practical in the treatment of what is popularly called theoretical. . . . We can recommend the book, notwithstanding its title, "Small Yachts," to all yachtsmen without reference to the size of their vessels, existing or in prospect.

Boston Herald, Oct. 4, 1885.

One of the best publications on small yachts that has came from the press for some years. . . . The volume as a whole commends itself to the yachtsmen or to the landsman who seek information on the subject of building, rigging, fitting out and sailing yachts.

American Canoeist, October, 1885.

To the man interested in boats—building, rig or sail—Kunhardt's book will be as interesting as a novel. It will not be read through once and then shelved, but will be kept in a convenient place for easy reference. It cannot get out of date.

New York Commercial Advertiser, Oct. 6, 1885.

This collection [the plates] is a concise history of yachting with small boats at the present time, and has a value which is not easily overestimated. . . . The many merits of the book will commend it to all who are interested in yachting and to all who want to be.

San Francisco News Letter, Dec. 5, 1885.

The largest, most complete and handsome volume upon small yachts shat we have seen. . . . The whole scope of yachting is ably handled.

The Germantown Telegraph.

It is beautiful in workmanship, abundantly illustrated and proves itself on every page the work of a writer thoroughly conversant with and enthusiastic about his subject. . . . It is to those who love yachting for its own sake and are intent to be their own masters that this work will appeal most successfully, for it shows how to build and run a small yacht, which will give all the sport one wants and make a true sailor of its owner.

New York Herald, Dec. 12, 1885.

There is a growing tendency among those who delight in "a whiff of the briny" to own a small and staunch cruiser, and to sail either single-handed or with a nautical shipmate. To those whose fancy lies in that direction, but who have not yet achieved their ambition, we cannot conceive of a better book than this of Mr. Kunhardt. There are numerous large plates and designs of every kind of boat, which can be recommended as reliable. There are sail plans and rigging plans, and there are also many shrewd suggestions and hints which the old seadog as well as the young tyro may read with advantage. The Forest and Stream Publishing Company issue the book in a style which does them great credit.

Now Ready. Price, postpaid, $7.00.

Shooting on the Run.

LYMAN'S
Pat. Hunting Sight

Makes a Sporting Rifle perfect. Address

WILLIAM LYMAN,
Middlefield, Conn.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in 1885 we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM'S constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This in the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table. We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

GOOD THINGS IN STORE FOR 1886.

Among the papers and sketches to appear are the following:

Sam Lovel's Camps.

An account of Sam Lovel's experiences when he took Uncle Lisha's advice and went trapping on little Otter. By THE AUTHOR OF UNCLE LISHA'S SHOP.

To the Walled-in Lakes.

Sketches of exploration and hunting in the Northwest with the Blackfeet and Kootenays. By "Yo."

Cruise of the Coot.

An account of a voyage alone in a single-hander from New York along the Atlantic seaboard to Florida. By C. P. KUNHARDT.

Hunting in the Himalayas.

Scenes and incidents in the life of an Indian forester. By "SHIKAREE."

Falcons and Falconry.

An introduction to the sport of hawking, with illustrations, drawn from nature. By R. W. SEISS.

Game Preserving in Britain.

A comprehensive series of papers on practical game preserving in Great Britain, with descriptions of the game birds of the British Islands, and sketches of sport. By "MOORMAN."

Scrimshawing.

A popular account of how a whaler spends the idle hours aboard ship. By JAS. TEMPLETON BROWN.

The Lower Forms of Life.

A continuation of the admirable series of essays on the beginning of animal life. By JAMES STOLLER.

Studies in Botany.

New chapters on plants and plant life, written and illustrated from nature. By A. W. ROBERTS.

Land and Water Experience in Florida.

New chapters of experience on the Gulf Coast. By "NESSMUK."

Cruise of the Pilgrim.

A delightful description of a summer voyaging on the Atlantic in the cutter yacht Pilgrim. By W. H. WINSLOW.

Days with the Barmacide Club.

A vivacious account of angling luck, good and bad, in Adirondack waters, whose name, latitude and longitude the author refuses to disclose. By MILLARD

Camps of the Kingfishers.

A further relation of what befel the Kingfishers in their sojourn at Carp Lake, Michigan.

Camp Flotsam.

A new series of the chronicles of the outers at Camp Flotsam, with accounts of bass fishing in Canadian waters. By WAWAYANDA.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

ANSWERS TO CORRESPONDENTS.

THE INDIANS' LANDS.

A NEW project for the amelioration of the condition of the Indians is now in high favor. It is a kind of patent plan, which is to civilize the Indian and make him self-supporting—if he survives its adoption. It is advocated with a little qualification by Gen. Sheridan.

It is proposed to allot to each Indian family 320 acres of land and to throw the remainder of the reservation open to sale at $1.25 per acre. The sale of the surplus land, it is calculated, would yield a sum which, invested in Government bonds, would produce an annual income of about $4,480,000—a sum which considerably exceeds the amount now appropriated for the Indians.

The assumptions upon which this reasoning is based are very largely fallacious, and the figures which appear to support them lie as only figures can. It is misleading to say that all or even the greater part of the reservations left over after the best locations have been taken up for the Indians' farms, could be sold. A very small portion of the land—that along the creeks and near springs, where water can be had—could so be sold at once; but the dry uplands, the arid sage plains and the rough and rocky mountain sides, which constitute so large a portion of many Indian reservations, would never be bought up at anything like the price named. It is but a short time since a portion of the land grant of a great corporation—a strip forty miles long by twenty wide—was sold for seventeen cents an acre. This was in a cattle country and the land was bought for range.

Moreover, the income mentioned would not support the Indians. The beggarly appropriation made by Congress sufficed up to two or three years ago, but they are sufficient no longer. Up to that time there were some buffalo left, and a good deal of smaller game, on which the Indians subsisted. Now all the game is gone except a few grouse, prairie dogs and sand rats, and the Indians must have government food or starve. For the last two or three years a great many of them have starved.

The time is close at hand when the friends of the Indians must use all their influence to protect him in his rights. The West is settling up more rapidly than ever, and greedy eyes are casting covetous glances upon the contracted lands which the red men still hold, as well as upon their flocks and herds. The reservations are pronounced too large, and about their borders hover many men who have already selected the claims on which they will settle and file as soon as Congress shall have thrown the territory open to settlement. In the Crow, the Flathead, the Shoshone, the Bannack, the Piegan, Gros Ventre and Assinaboine reservations and a portion of the Indian Territory are choice tracts of land which the white men eagerly covet.

They can hardly wait for these lands to be legally thrown open to settlement. It was only two years ago that the best springs on the arid reservation of one of the Pueblo tribes were boldly claimed by a powerful corporation, the lands about them seized, and the hapless owners of the soil, who depended for their crops on this water, warned off with threats. Invasions of the Ocklohoma strip are continually being made by supposed settlers, who coolly defy the proclamations of the President and the opposition of the United States troops in their endeavors to seize lands owned by the Indians. Now and then gold or silver is discovered on a reservation, and the whites flock in and cannot be ejected.

Their lands should not be allotted to the Indians in severalty unless it can be shown that such a plan will result beneficially to these people. The time will come, and we trust soon, when this may be done; but it has not come yet. The proposition to allot the land in severalty takes it for granted that the land holders would be able to manage farms and to use them at least as a partial means of support. This is not true at present, nor can it be for years.

The average wild Indian is as yet wholly incompetent to manage a farm or to support himself. Until he has acquired at least the rudiments of a farmer's education, it will be mere cruelty to give him one. Since the soil on most of the reservations will not produce crops without irrigation, the allotment of the land in severalty would necessarily scatter the Indians far and wide along the creeks and rivers, and it would be impossible to exercise over them the supervision which they need, unless an army of officials were assigned to each tribe. The labor of teaching them would be enormously increased. Day schools for the children would have to be established in great numbers, or else those living at home would have to go without education, and only such as might be at the boarding schools would receive instruction. And for the present we can only hope to see a very small minority of the Indian children sent to the boarding schools.

These are some of the practical difficulties in the way of the plan to allot the lands to the Indians in severalty. The chief objection to this project, and the one which utterly condemns it, lies in the fact that it would result in bringing the Indians into close contact with the whites. To give the Indians their allotments and then throw the unoccupied land open to sale means that Indians and whites would live together on what are now the Indian reservations. The result of such a mixed settlement would be utterly disastrous to the red man. He is not yet fit to walk alone. He has little self-control. Like a child, he will barter for some trifle which has caught his fancy his most precious possession. He is fond of liquor, and a tin cup full of the vile whisky of the border will purchase his good will and all his secrets.

In a mixed settlement of whites and Indians the latter would in a very short time have parted with all their possessions. They would be sold whisky as long as they could pay for it, and would become hopelessly worthless and wretched. Their women would be debauched and the men drunkards. They would be paupers whom it would be necessary to support or to see starve. If they are to be supported it should be done as now, on the agency, where they are measurably free from contact with the white man, where whisky is not allowed and where for the present they can be taught in a body far more easily than would be possible if they were scattered out over a wide extent of country. There is nothing in the present agency system to prevent the Indians taking up farms as soon as they know how to manage them.

Those who advocate this allotment plan of dealing with the Indian are recommending a step which if adopted now, will result in his speedy extinction. They show little acquaintance with Indian character.

Immediate contact with the white man the wild Indian cannot survive. He must be protected from himself until he has made some progress toward the self-control which is a distinguishing character of civilized people. It will be time enough to turn him adrift to take part unaided in the struggle for existence, when he has learned in part the lesson of civilized life. These savage descendants of barbarous sires are the weaker race. Put into competition with the whites they must perish unless a helping hand is extended to them. In such a struggle the weaker must go to the wall. It is a law of life that the fittest shall survive.

THE TRAJECTORY REPORT.

WITH the present number we bring the report of the trajectory trials of hunting rifles to a finish, and conclude our exhibit of what this class of arms show themselves capable of doing under the conditions as they prevailed at Creedmoor during the pleasant October days used for the trial. We have made the matter as plain and simple as possible, and in the pamphlet form in which it has been placed for future reference will, we doubt not, form a permanent addition to the literature of the rifle.

Taking the trial through, we think the riflemen of the country are to be congratulated upon having the choice of so excellent a selection of rifles from which to choose when they seek to supply their kit with a reliable field arm. Any of the rifles named may with safety be trusted, so far as accuracy is concerned. Some are closer, harder hitters than others, and generally in proportion to the charge employed; but to none of them could the complaint be properly laid that it was an unreliable weapon. Every marksman must habituate himself to the peculiarities of his piece before he can use it with satisfaction. In other word, "get the hang" of his rifle. Because a rifle makes a good showing in one table of trajectory heights would not be evidence *per se* that it was a better arm than another with a few tenths of an inch more height above the line of sight in the track of the moving bullet.

To our friends and readers out after game, we can offer the assurance that when they miss they may in the future know just how far high trajectory and how far bad holding has to do with their bad luck.

In the absence of an international match to mark the year 1885, it has been the privilege of the FOREST AND STREAM to mark this year of our Lord with another event of great interest to the rifle-shooting world. Our report we throw open for discussion, and we shall be pleased to hear what any of our frinds may feel inclined to say.

Already we have had many queries; many of them have been answered in the course of the report. If there are any points which have not been fully covered or clearly understood, we shall be happy to give further information; and in the mean time, until occasion shall arise with the improvement of rifles, our tables of averages will remain, no doubt, the standard on this point of the shooting art.

THE FISH COMMISSION AND THE AUDITOR.—After all the charges of unnecessary expenditure at Wood's Holl, made by First Auditor Chenowith who refused to audit the bill for plumbing, the accounts have been passed by higher authority, which at the same time declined to allow the payment of bills of Auditor Chenowith for new carpets, rugs, brass furniture for his fire-place and other articles of pure luxury. It is evident that the Auditor's objections to extravagance were never intended to be applied to his own case. He was seeking personal notoriety by sending out vague newspaper accounts that there were "irregularities" in the bills of Prof. Baird, which had the effect of making the public think that his keen perception had discovered a very large African in the Fish Commission wood pile. The Washington *Sunday Herald*, an Administration paper, said on Sunday last: "The recent approval by the Controller of the accounts of the Fish Commission tend to show that the startling discoveries heralded with a flourish of trumpets by special correspondents are indefinitely postponed. Any one who was at all acquainted with Prof. Baird's character and standing, or who knew Major Powell, of the Geological Bureau, could not be made to believe, without evidence of the clearest kind, that either had been guilty of anything crooked. As nothing wrong has been discovered, although the desire of finding 'irregularities' has been evident, it is presumed that for a little while calumny by innuendo will cease, so far as these officials are concerned."

SENSIBLE GAME CLUBS.—There are many thousands of sportsmen who cannot afford to own shares in the expensive game clubs owning choice preserves. But it is quite within the power of the gunners, in any given locality, by associating together to provide for the conservation of their game. Our remarks on this topic last week have brought to notice a club working in the manner then proposed. A report of this we hope soon to lay before our readers.

THE FOREST AND STREAM'S GRIZZLIES are the most attractive animals at the Central Park menagerie. They are in a great cage out of doors, and tens of thousands of visitors have been interested spectators of their ursine idiosyncracies.

TO THE WALLED-IN LAKES.

V.—HUNTING WITH THE KOOTENAYS.

THE morning broke dull and lowering. We were early astir, and cast many longing glances toward the trail down the lake along which the Kootenay would be seen as he rode toward the camp. It was 10 o'clock, however, before any one appeared, and then the two riders who galloped toward us were seen to be a couple of well-grown boys, and not the Indian who had promised to come. By this time it had begun to rain, and it seemed useless to start out, but the boys, when they reached camp, told us that they could take us to the mountain where sheep were plenty, and explained the absence of our friend of the previous day by saying that he had lost some of his horses, and had been obliged to go off and hunt for them. Almost anything seemed to me better than a rainy day spent in camp, and so Yellowfish and I saddled our horses and prepared to accompany the boys. Appekunny preferred to remain in camp.

We started about 10 o'clock, the boys in the lead at a wild gallop, with blankets flapping and quirts flying. Leaving the trail at the big creek which flows into the inlet flat, and keeping to the east of that, we rode for several miles up a narrow, open valley, bordered on either side by spruce-clad hills, and then turning to the left struck into the timber. We had ridden all the way at a fast lope, the Indian boys having no mercy on their horses, and seeming to take a mischievous pleasure in riding them as hard as they could make them go. Every now and then the leader would look back at me and laugh, and then would bring down his quirt as hard as he could on his horse's flank. All this time it was raining very hard, but as I had donned my rubber coat, I was not wet much above the knees. There was but little down timber in the forest through which we were now riding, but the trees often stood very close together, and the ascent was terribly steep. Generally we followed the hog backs, but sometimes we would have to plunge down into a ravine so steep that the horses would set their feet and slide down the slope, and then on the other side have to stick their toes into the ground hard, and scramble up like squirrels, while the rider held on with legs and hands to keep from slipping backward over his horse's rump. Here and there was a faint trail, and I often saw the fresh horse tracks made by the hunters of the day before. The boys, however, were constantly losing this, and only kept on in the direction they wanted to follow.

At length we reached a point near the edge of the timber, where the boys signified that we must leave the horses. We dismounted and then followed fifteen minutes of very steep climbing up a slippery grass-covered slope, which brought us to a level platform covered with dwarf evergreens, whose gnarled and and twisted branches showed the tremendous force of the winds to which they are continually exposed. As we pushed our way through these, I could see by the greater care exercised by the boys, and by the way in which they looked into their guns to make sure that the cartridges were there, that we had reached the hunting grounds, and in a few moments more we looked cautiously over the bushes on to the bare mountain side. At our feet the plateau ended, the ground dropped off sharply for a hundred feet, and a deep naked saddle extended from the spur on which we stood to the main mountain, which had all the boldness and ruggedness characteristic of the range in this region. On the west the saddle broke off sharply in a very steep clay slope, and to the east by a more gentle descent into a deep ravine, in which grew a thick mat of stunted spruces, among which were the fallen and decaying trunks of some very large trees. Above the saddle for perhaps 1,000 feet was the gray talus slope, rocks piled on rocks in wild confusion, just as the fragments had fallen from the heights above. The slope seemed too steep for ascent, but faintly lined upon it in all directions could be discerned the sheep trails leading up and down. Above the talus was the massive vertical wall which constituted the true summit of the mountain. This was black with the wear of the storms of ages, and toward either end was weathered into turrets and pinnacles of curious and fantastic shapes. Away to the west the bare mountain side, rough with vast masses of rock and seamed and broken by cañon and ravine, stretched away toward the shores of the great lake.

Some little time was spent in examining the mountain side before we emerged from our concealment. We detected no game, and creeping carefully down the steep and slippery face of the bluff, gained the saddle. Here there were numerous tracks of sheep that had been made this morning. One of the freshest was that of a great ram, which had passed along but a short time before, whose spreading hoofs had sunk deep into the soft soil.

It had begun to rain with great violence, just after we had left our horses, and now that we were on the bare mountain-side and no longer protected by the forest, we felt the full force of the storm. The wind swept down from the peaks as if it were trying to lift us from our feet and carry us away, and with the wind came showers of cold rain and squalls of snow, and clouds of chilling mist. The sides of the mountain were hidden from view. We gathered under the lee of a huge fragment of rock, and after a few moments' consultation the biggest Kootenay boy girt his blanket about him and set out for the east end of the rocky wall above us. The younger one, who remained, told us by signs that his companion would try to start some game and drive it to us. So Yellowfish clambered a little higher up on the mountain, and sat upon a rock there while the younger Kootenay and I cowered behind a great boulder a little below him.

It was to me a wonderful thing to see that sturdy, bow-legged Kootenay boy march steadily up the face of the talus slope. He never hesitated or paused for breath, but marched ahead as regularly, and apparently with as little effort, as if he were walking up a pair of stairs. Slowly he grew smaller and smaller to the sight, and at length, a mere dot, disappeared behind a pinnacle of rock.

It snowed constantly and blew with great violence, so that it was bitter cold and my comrade and I shivered behind the rock. I found at length a dry spot on my clothing where I could strike a match, and when my pipe got going I felt better. I had taken quite a fancy to the younger Kootenay boy, who had a lot of fun in him and was brimming over with mischief, and as he seemed quite as miserable as myself I passed him the pipe, for which he seemed extremely grateful. So for an hour or two we waited and shivered and smoked. At length we heard a crackling down in the ravine, and saw Yellowfish gathering sticks for a fire, which he soon had going finely. We joined him, and as we did so, saw the other boy making his way slowly down the mountain. When he reached us he reported that there were plenty of sheep on the other side of the mountain, but the snow and fog were so thick that he could not see them and could do nothing with them.

We went back to the horses, and, cold and wet, began the descent of the mountain. This was even more disagreeable than the climb up had been, for now we had not hope to sustain us. We wound in and out among the tree trunks, slipping down steep places and then scrambling up others as steep, keeping as far as possible on the ridges, but often being obliged to cross deep ravines. Once or twice we tried to follow one of these down toward the lower ground, but in each case we found our passage barred by a network of fallen timber, or else by the narrowing of the gorge, which thus became impassable on account of the soft bottom. The only incident that varied the monotony of this climbing was a tumble which I had. Jerry was larger than the Indian ponies, and not nearly so agile, and in attempting to follow the boys up the side of a very steep ravine he tumbled over backward. When I felt him going I jumped from the saddle, and horse and rider rolled down the steep bank side by side. Neither suffered any injury, but I was very well pleased that I had got out of the saddle in time to avoid being struck by the horse. A more successful attempt to mount the bank was made at another point, and I followed the tracks of the boys until I overtook them at the edge of the timber.

In camp that night after dinner I was grumbling at the bad luck which seemed to follow us, which was due largely to the wretched weather, when Yellowfish suggested a remedy which had not previously occurred to me. He said: "Why don't you promise to make a present to the Sun if you get a sheep, when you hunt to-morrow?" The idea seemed a good one, and the vow was accordingly made; the terms being that if I killed a sheep on the morrow I should give the Bear-pipe—*i. e.*, the medicine pipe which is sacred to the Sun and the other gods—a dance on my return to the agency.

Like other superstitious people, the Piegans endeavor to avert threatened evils by presents to their deities. When the gods are ill-disposed toward them, their favor may often be purchased by a gift, or even by the sacrifice of something, which, though precious to its possessor, can scarcely be supposed to have any value to the being to whom it is offered. This belief is common to most, if not all, Indians, and I have seen striking examples of it in several tribes. One grizzled old Ree warrior, with whom I once campaigned for several months, had cut off four or five of his fingers in order that he might succeed in killing his bitter personal enemy, and he related to me with infinite satisfaction the story of his plotting and waiting for seven years, and how finally his prayers and his sacrifices were crowned with success, and having killed his enemy he took his heart home to his lodge and then cooked and ate it. I have been told of an instance in another tribe where a man attempted to purchase the favor of the gods by killing his only son, a young boy to whom he was deeply attached.

The Sun being the chief of the Blackfoot gods, it was natural that he should be mentioned by Yellowfish, but it is probable that this was only a figure of speech for all the gods, and that the offering was not to be confined to him alone, but would be shared by *Napi* (old man), as well as by all "above people," for when a Bear-pipe dance takes place the prayers are addressed to all of these. Yo.

THE FORESTRY COMMISSION REPORT.

THE pressure brought to bear on the New York Legislature to take some measures to arrest the destruction of the forests of the Adirondacks, proceeding as it did, from the most influential citizens of the Empire State, was too determined to be ignored. Every obstacle was placed in the way of immediate legislation by the lumbermen of the region, who saw themselves charged with the reckless destruction of the forests, and the conversion of the pine-clad hills into a bare rocky wilderness, and who feared that popular clamor might result in the imposition of undue restrictions upon the lumber industry. Several bills were brought before the two houses in the sessions of 1884-85, none of which became law, but a compromise satisfactory to all parties was effected by vesting authority in the Comptroller to appoint a commission to examine and report upon the condition of the forests, to investigate the causes of their destruction and to suggest measures for the future administration of the State lands, and for such control over operations in private lands as might be deemed essential to the public interests.

Acting on the authority thus vested in him the Comptroller appointed a commission composed of Prof. Sargent, of Harvard; Messrs. D. Willis James and E. M. Shepard.

These gentlemen visited the region personally in the summer of 1884, appointed experts to determine the areas of the timber lands and waste, which were indicated by shading in a map prepared for the purpose; investigated the several points at issue for themselves, secured information from every possible source, and at the close of the year submitted to the Comptroller a report which may be fairly characterized as a model of clearness, conciseness, and impartiality; at the same time it affords abundant evidence of the conscientious thoroughness with which they executed a public trust gratuitously undertaken.

The total area of the Adirondack territory registered as State property is 781,000 acres, but the Commissioners found the boundaries so ill defined that a considerable amount of survey work will be required to secure the State in its possessions. The amount of destruction by reckless felling and firing is described in language studiedly temperate, but the Commissioners illustrate this part of their report by an admirable series of photographs, depicting deserted fields, with their exhausted soil, and stony hillsides divested of their forest floor, in language more eloquent than pen could tell. Contrary to general anticipation, and perhaps contrary to the preconceived opinions of the Commissioners themselves, the lumbermen are not found to be the prime offenders in this work of devastation, although they too come in for a share of public censure. The chief offenders are the farmers, who, tempted by the cheapness of the land to carve out homes for themselves in the wooded wilderness, defy the hard climate, make light of the thin soil, and clear field after field, only to desert them as soon as the thin coat of humus is exhausted. This continual clearing, say the Commissioners, involves frequent firing, purposely undertaken when the forest is driest, and generally resulting in the spread of the conflagration to the neighboring woods. The lumbermen are let down easily. The Commissioners satisfied themselves that felling operations are restricted to the pines and spruce, which appearing mostly as isolated trees or small clumps in the midst of hardwood forests, their removal does nothing to destroy the forest character of the scenery, nature exerting herself immediately to fill up the blanks with saplings from the surrounding forest. It is nevertheless pointed out that the amount of top lops and branches left on the forest floor to dry, are fatally instrumental in spreading fires encroaching on the forests, and that these fires are frequently due to the culpable negligence of men in the lumber camps. They observe further that the hard woods of the region are likely ere long to come in active demand, and unless (as seems improbable in private hands) these forests shall be worked systematically for the maintenance of a permanent yield of timber, wholesale denudation must be looked for as a matter of course.

Nevertheless the Commissioners, while holding the view that it is desirable in the public interests that the whole region be controlled and its forest character maintained by the State, deprecate resumption by law of eminent domain, as certain to result in the creation of artificial values, and in committing the State to an extravagant outlay. They usually deprecate all attempts at State interference with private management, as opposed to the general sense of the community, arguing with some justice that the State has not yet evidenced any such capacity for the economic management of its own forests, as would justify any interference with private owners. The spirit of their recommendations on this head is, "Let the State show what it can do with its own forests first in the matters of arrest of destruction, restoration of denuded area, and economy of management. The State owns one-fourth of the region, and if destruction continues to spread in the other three-fourths it will rapidly pass into State hands for taxes due."

In this connection the Commissioners recommend one measure as politic as it is just, that State lands be chargeable with their proper quota of local taxation; the fact that they have not been assessed in the past has proved a temptation to adjoining owners to buy up the lands in the market, on speculation, as the burthen of added taxation would fall on them equally if they let them pass to the State.

After suggesting some general measures for the suppression of forest fires, the Commissioners recommend that the management of the State forests be vested in an honorary commission of three members, to be appointed by the Governor, with the approval of the Senate, one of them retiring at two years, the second at four, the third at six years, the vacancies thus created being filled by the same authority as they occur, so as to create a permanent commission, with a periodical infusion of new blood. On this point only was there a want of perfect unanimity among the members of the Commission, Mr. Poucher expressing his preference for vesting the independent control of the forests in a forest warden or commissioner, subordinated to one of the public departments; but all are agreed that the chief forest executive should retain office during good behavior, and not be liable to removal with change of political party.

Armed with this report, so well calculated to allay all anxiety as to attempted undue interference with private interests, the Legislature was able to put through a bill in the sessions of 1884-5. This bill, which received the sanction of the Governor, vests the care, custody, control and superintendence of the State forests in the Forest Commission, together with charge of the public interests of the State, with regard to forests and tree planting, and especially with reference to forest fires, in every part of the State; and invests the Commission (subject to the provisions of the Act) with "all the powers now vested in the Commissioners of the Land Office, and in the Comptroller, as to such of the said lands as are now owned by the State," and leaves them untrammeled in their selection of the warden and his staff, and in their distribution of the sanctioned annual expenditure among all heads, stipulating only that the annual grants shall not be exceeded. Everything has in fact been done to render the new department independent of the control of political party.

The supervisor of every town in which State wild lands are situated is made *ex-officio* protector of such lands, and is subordinated to the Forest Commission in respect of them. It will be the duty and, we suppose we may say, the privilege of the supervisor to appoint the forest guard or guards for his own township. The Forest Commission will determine the duties and pay of the guards. The supervisors of every town in the State have also authority to appoint fire wardens, who must be local residents, and to execute a map of the fire district of their several towns at a cost not exceed-

ing $5. But within the principal forest region of the Adirondacks the fire wardens will be appointed directly by the Commissioners.

Finally, the act provides that the Forest Commission shall take necessary measures in concert with the Department of Public Instruction, regents of universities, etc., for awakening an interest in behalf of forests in all State educational establishments and for imparting elementary instruction in forestry. They shall, further, and as soon as practicable, prepare tracts or circulars giving plain and concise advice for the care of woodlands upon private lands, and for starting new plantations on areas that have been denuded by fire, erosion, or in any way exhausted or laid waste; and shall distribute such tracts without cost to all applicants and take measures to bring them to the notice of persons who may be benefitted by such advice.

To enable the Commissioners to give effect to all these important measures the Legislature sanctioned an expenditure of $15,000 for the year, and Messrs. D. Willis James and William Dowd, of New York, and Mr. Basselin, who is an an Adirondack lumberman, were appointed Commissioners. The two former declined to serve; they probably thought that one Commissioner would be equal to the disbursement of $15,000.

Nothing was, consequently, done during the summer of 1885, but in the autumn of the year the Governor appointed Messrs. Townsend Cox and Arthur Knevals, of New York, to the vacant places on the Commission. It is understood that these gentlemen have accepted, but it is simply absurd to suppose that they will throw themselves with any energy into the work unless assured of adequate means and opportunity of carrying out such measures of conservancy and restoration as shall reflect credit on their management of the public reserves.

The public interest must not be allowed to flag, or it may turn out that the passage of a forest bill and appointment of a Commission are merely temporizing measures, inoperative to arrest the destruction of the remaining forest area or to effect the restoration of the denuded State lands.

All the pamphlets that may be written, with all the interest that may be awakened on the subject, will be of little avail to arrest the course of forest destruction. Teaching by example is more effective than by precept. We want a competent forest department, administering the State forests with economy. The establishment can be secured at small cost, but it would be worse than useless without means to keep it profitably employed.

A PLAINT.

I'T'S an oyster boy I am,
And work at an oyster bar;
I have an austere boss,
Also a clamorous ma.

I have a fishy dad,
It's skinnin' eels he does,
'Cept in season scalin' shad,
Or countin' crabs by the doz.

The old folks drink like fish,
And are barnacles on my pay;
It's for better times I wish.
Or else I'd run away.

My life is like a ragged net;
Luck has all run through;
The poles druv wrong, in a bad place set.
Oh, dear! what shall I do?

BOSTON. REIGNOLDS.

A NEW ATLANTIS.

SITTING by an open fire this afternoon, with the thermometer outside close to zero and a blinding storm driving the snow through the very crevices of the window sash, my thoughts have gone to "Nessmuk" and Dr. Neidé in their present balmy quarters, and to the Coot, bound thitherward; and thence to the pleasant spot I have found for my own annual vacations. That your readers may know what is obtainable nearer home I propose to tell them of my discovery.

The Happy Island is distant only ten hours from New York and less than five from Boston. Unfortunately there is a summer "watering place" at one end thereof, but the presence in it of divers neatly dressed people exerts no deleterious effect on the more rational wearers of old clothes who inhabit the remainder of the island. Providence has fixed a great gulf between them, first in some miles of sandy road, and secondly in the "Oak Barrens." This scrubby successor to the aboriginal pines forms a most excellent abattis against the advance of civilization, and only the wise ones know the number of gray rabbits who dwell therein, or that it is one of the few remaining eastern homes of the ruffed grouse.

After traversing this miniature forest you come to miles and miles of high rolling hills, without a tree or bush upon them, being covered chiefly with crisp, slippery moss and occasional patches of real heather. After repeated dressings of seaweed this changes to a fine short grass, the pasturage of many sheep, whose teeth can cut it, though a scythe could not. The glacier ice which made these slopes has left no successor, even in winter, but the sides are steep enough to yield summer coasting for the boys, who, piled in layers on smooth boards, glide down several hundred feet with a velocity not unworthy of St. Petersburg or Montreal.

The wind blows keenly over this bare ground and is a glorious companion for one of the finest tramping places of the continent. The moss is a soft carpet that takes the impress of each footstep; the air is ozonized by the surrounding sea, and every hilltop gives an ocean view where the horizon is broken only by occasional white sails. Add that the easterly storms of August bring the plover in their train and that the spring-fed hollows hold many a woodcock, and then imagine how your setters range over the unbroken ground until brought to a picturesque point before some clump of sweet fern or patch of blue berries.

The coast line is indented here and there by pretty harbors into which the trading schooners flock for temporary anchorage when wind and tide are contrary, and occasionally appears a trimmer craft flying the triangular pennant with the starry cross or diagonal bar of our two leading yacht clubs. Here the bonita and the bluefish chase the young herring, and, by the swift collection of screaming gulls overhead, call the shore boats to the spot. Then a light spoon, a Henshall rod and good multiplying reel can be depended on to give you a four to eight pound fish, whose large flaky muscles will be appreciated no less when boiled for supper than in the recent struggle to draw them from the water.

The tide flowing each way over the shoals south of the island, breaks into great fields of white, whose curling billows, just before they edge out into foam, are the paradise of the bluefish and of that other anti-type of Eden called the shark. Starting at the proper hour in one of the roomy, staunch and swift catboats used by the local fishermen, a sail of some six miles brings you to the place. On each side of the centerboard stands a great tub and the two are the measure of your expected catch. Before reaching the "Rips" the lines are over-run, fresh eel skins slipped upon the jigs and the outriggers put in place which enable one or two men to tend four lines. At last you strike the fish and for an hour or two it is a question only of how fast you can take in the lines, replace a chance jig carried off by sharks, or keep the hooks clear from the floating grass that forms the only drawback in this noble sport. I say the only drawback, but there is one supreme moment in the experience of each new comer, old sailor though he be, when after some twenty rapid courses back and forward in the trough of the breakers, a tribute must be paid to Neptune for his gifts to you. However, the loss is soon replaced, for slack water comes quickly when time is so fully occupied, and no sooner are the sheets loosened and the bow turned homeward than the skipper produces a basket and a stone jug from the little locker underneath the tiller. The one contains only ship's bread, cheese and home-made doughnuts, and the other nothing but fresh water, yet how good both taste.

This, however, is only a common seaside experience, and the same may be said of the shooting on the numerous sandy points beloved of snipe and curlew. But beyond ringnecks and yellowlegs in abundance, there are many strangers on the island whose acquaintance is gladly made through the introduction of FOREST AND STREAM. More than one sportsman there always carries your "Shore Birds" in his pocket.

Far as the land permits from the hotels of the tourists stands a certain club house, to which sundry gentlemen resort who spend many days, with hired assistance, in casting the heavy Cuttyhunk line for still heavier bass. Great tales have these same bass, but doubtless veritable ones, although little reliance can be placed on photographs, as those showing a fish larger than the fisherman may be produced by apt perspective and fore-shortening. The writer has never been within some miles of the club domain, but knows various members whose business credit is unimpeachable and general character for veracity good, and therefore feels that the bass themselves may be believed in. Also he is glad to avouch his conviction that the rubicund faces with which those gentlemen return to civil life are not the result of the club dietary, but of hours spent on their casting pier in face directly of both the Atlantic Ocean and the midday sun.

My own club consists of wife, six children, two servants and myself. The club house I bought four years ago when first permeated by the atmosphere of the Happy Island. It stands right on the shore of one of the little inlets above mentioned, and has no neighbor within sight except across the water. The walls are about eight feet high, the double pitched roof three times as much; in fact the house is chiefly roof, with one great predominating chimney made of the smallest bricks imaginable. The frame is of hewn oak, about ten by fourteen inches section, and must have been put up near the beginning of the last century, and it will stand apparently when all the modern seaside cottages have gone back to *humus*. House and roof alike are covered with warped shingles of a sheeny gray color that art could not duplicate, any more than it could the green and brown lichens thereon. The ceilings and most of the partitions are of paneled oak. There are thirteen rooms and four open fireplaces, with the original iron cranes and pot-hooks still in them.

Now, for this house with six acres of land, a barn, a large shop—once used for building whaleboats—a smoke house and two fish houses, I paid for fee simple less than one thousand dollars. A little pier reaching out to deep water has since been added, and a large double bathing house. The latter serves in winter, by taking out a movable partition, as a storehouse for the Skip Jack (which we consider the neatest eighteen-foot boat in those waters), her mooring, anchor, the lobster and eel pots, etc.

For subsistence the club has to depend pretty much on what itself can shoot or catch, though fresh meat can be obtained by going some distance in the boat on Saturdays. There is no danger of starvation, for a good mess of panfish can always be taken in a few minutes from off the little pier, and there is a box under the same which holds ten bushels of "quahogs" (most toothsome of clams) and which, like the Irish widow's cruise, is always filled when it is empty.

From these headquarters the club radiates, sometimes on foot, starting betimes, carrying frying-pan and condiments, lines, rods and guns, and keeping a sharp lookout for mushrooms, which grow there abundantly. Sometimes in the Skip Jack, when a wall tent and blankets form part of the cargo, and if luck is good at the distant spot where the tent may be pitched, there is no saying when the party will return. Sometimes in a hired conveyance, being the only one in those parts of sufficient capacity for our number. In fact at other times the same is used for distributing coal among the fishermen and farmers, but by scrubbing it out the previous day with salt water and using very thin boards for seats it does admirably.

A charming feature of the island is the so-called "ponds" wandering everywhere for miles up the deep valleys. They furnish vistas hardly less picturesque than the Adirondack lakes, while they support a fauna different both from that of the fresh water territory above them and the sea life just across the narrow beach that separates them from the surf. Especially to be mentioned are the great vicious snapping turtles, whose capture is a triumph to the small boy, and innumerable large white perch, wanderers from the sea, but developed if not changed by their new circumstances. These take the fly most greedily, and no better practice could be imagined than to stand on a clean white beach and have a rise from two or three active 24-ounce fish every time the leader reaches forty feet from shore.

The island lies far enough to eastward to intercept most of the migratory waterfowl who journey along the coast. Many a northern goose stops for his breakfast in one of the clear ponds alluded to, and more than one group of ducks is so much pleased with the place as to remain there all summer. And with a story of the opening of the present season for the latter I shall close, as I would not make my beloved island too attractive lest it become too populous.

One of the surest places there for ducks is No Bottom Cove, but Jack Green, the best shot and fisherman on Happy Island, lives hard by and there is a poor chance for picking up anything behind his gun. This year two of my boys, chips of the old block, but rapidly surpassing their father in woodcraft if not stature, determined in concert with their cousin to circumvent Jack Green. The lot was cast by "thinking of a letter," and it fell upon the oldest, Harvey, to go out the night before, take possession of the only good blind upon the point and hold the fort against all comers and especially said Green, until the boy's comrades appeared at daybreak of Sept. 1. He knew the route well, but going through oak woods in a dark night is quite different from the same thing by day, and after some hours' wandering he was fairly lost. At last he saw a light and working his way to it, knocked at the door of a little house. Alas, it was opened by Jack Green himself! Harvey is quick, and at once asked the way to Nancy Looks, a widow who sells eggs and lives not far from his objective point. Jack gave the directions, but the lad's rolled-up blanket and Greener did not exactly look like buying eggs. Finally Jack said, "You are going to No Bottom Cove, aint you?" and Harvey answered meekly "Yes." According to the latter's account both stood silent for nearly a minute and then broke into hearty laughter which lasted much longer. In the end Jack asked him into the house, said he had built a new blind in another place this year, and they parted the best of friends. Next day the three boys contributed eight brace of ducks to the mess chest of the club. M. V.

P.S. In honesty it must be confessed that several attempts have been made to connect the fashionable end of the island by a telegraph cable to the main land, but some good collier always anchors over and breaks the wire. As a business man I am glad to say it takes 36 hours for a message from my office to reach me when at my summer home. V.

AMONG THE CORAL REEFS.

IT was a lovely morning in December; flowers were in bloom, birds were singing, a light breeze was stirring, wafting the odor of the cedars, and the general condition was one of serene comfort.

December, was it? It was, and that is the way it is in Bermuda. It was the delightful interim between seed time and onions, when the ambient air is not troubled by the tearful fragrance of the numerous bulb, when the oleanders still bloom and are glad of it, and the showy hibiscus lifts its trumpet to the morning sun.

The wee ground doves fluttered about there and there in the streets in trustful confidence, the pretty little songster called the chick of the village sang sweetly among the orange and lemon trees, and redbirds and bluebirds added their jubilant notes by way of matin greeting. Earth and the fullness thereof, the mellow sky, the beautiful waters, the fragrant air and all that is delightfully novel in these wonderful islands, contributed in making a morning that would have elicited comment in paradise.

I wended my early way down to the wharf near the Parliament House, eager for a sail, and not averse to catching an occasional fish. Though it was seven by the clock there was not much astir; not a store was open, not a wagon or cart to be heard, and never a "Here's yer mornin' paper!" affrighted the peaceful air.

"Hello, Johnnie! is the Bride of the Sea all ready?" I said, addressing a 16-year old colored boy, small of frame, scantily dressed, master of the sailing art, limber-tongued on occasion and as confident as a Congressman.

"Ay, ry, sir! she's waitin' for ye, ribbons on and all fixed up and isn't she pretty, though?" he replied, pointing to a little craft with a very high mast, mainsail and jib spread, and rolling gracefally at the end of her painter, which was attached to a buoy a short distance away in cozy Hamilton harbor.

In miniature the boat would have looked like the half of an English walnut with a broom-straw mast and "jib accordin'," rolling about in a tub of water. But it was quite stanch, not altogether ship-shape, as will appear, but a boat of local development that weathers great gun gales and comes back perspiring from pennant to waterline and with a real air of defiance.

Another small native took us out to the sailboat in a dingy, with our tackle and bait, lunch and rubber coats, and soon we were off, headed toward Great Sound, and the reefs beyond. And what a delightful sail it was! Now in a narrow channel between verdant islands, luxuriant with cedars, palmettoes, blooming lantanas and flowery plants that have no regard for the calendar, now gliding over the roof of a coral temple studded with glittering points in settings of the exquisite blue and green of the sloping shingle, now close to the corrugated shore of a submarine hill peering above the waves, now by a shelly reef pointing like a jeweled finger to the distant horizon, and so on to the reefs outside, among which we had to thread our way with great care to avoid getting fast on some treacherous shelf of coral.

But Johnnie understood his work; with wonderful skill he manipulated the sheets and the tiller, neither being in one position a moment, going before the wind, cutting the wave crests and throwing showers of aqueous diamonds to the right and left, close-hauled, speeding like a prizewinner, and again brought about to examine locations and indications, while the boat hardly moved more than to roll with an appearance of restrained impatience.

In the course of two hours we reached the desired place, five miles from the mainland, tossed over the anchor and prepared for a contest with sheepshead porgies, yellowtails, bonitos and other fishes of those waters. There was some danger of striking a red snapper, a long, lithe, powerful fish that could tear the boat from its cable if the tackle didn't give way; and also of hooking a maray, a vicious eel that is snake and wolf in inclination, a very pirate in chasing a crew overboard when he once gets on deck and takes active command. For the latter a club is kept handy, the line is drawn quickly through a scupper-hole and maray is pounded on the head with great energy as soon as he can be reached. Fortunately we didn't bring any in, and red snappers did not engage our attention.

While Johnnie was furling the sails and opening clams I unwound the lines, and at the same time looked with unfeigned admiration upon the rare scene that lay about us. Straight away to the south was Ireland Island, with its great docks and forts, its big guns and munitions of war, armed redcoats pacing the outer walls, and the picturesque lighthouse on Gibb's Hill looming over all. To the left eight or ten miles was Bailey's Bay, with its bright, curving shores and billowy foam piled up along the coralline rocks, and the gleaming water of Harrington Sound beyond, while to

the east and north was the distinct round of the ocean, its clearly-defined limit traced against the blue sky.

It was almost too nice a place to fish, almost too much of a jar upon human sensibilities to come suddenly from a view of land and water quite unsurpassed in all the world, from the sight of a sub-tropical paradise on the tip of a mountain down in the sea, from a rare display of the grand and beautiful in nature and art to—the consideration of clams for bait, and the best place to put out hooks and lines.

The fishes are graceful in form, and very pretty in colors and tints, the iridescent hues being wonderfully brilliant, while cloudings and sharp tracings of yellow and orange, and delicate transverse lines make live pictures that must be studied to be fully appreciated. Seen in schools in the deep, sky-clear water along shore, the effect is charming beyond description, the sheen of the agitated surface coming and disappearing and coming again, and the direct light of the sun seeming

"To blend in beauteous tint the colored mass."

We used coarse hand lines, with a heavy sinker and one hook to each, and fished in twenty or thirty feet of water, the tide carrying the lines some distance astern. The fishes take hold daintily, and one must be on the alert or his clam will be gone in a twinkling. I missed a half dozen times, and then got something prodigious, or at least that was the impression. It pulled and hauled, and held on stubbornly, and made it necessary to skirmish about lively on the unsteady deck, holding to the naked mast, kneeling down among the halliards, venturing out on the jibboom, and finally I brought up a great branch of lattice-like coral, which swayed about in the waves like a thing alive. Don't say that any one could tell whether he had on something alive or a fossil curio, for you know when one is in a strange place, isn't acquainted much, so to speak, he may be taken unawares, when under wonted circumstances he would be equal to any emergency. It is well, therefore, to avoid hypercriticism, and pay deferential attention to the gist of the story.

This difficulty occurred several times, and then I learned that I had to see by the sense of touch, and while keeping the sinker at a good depth not let it catch in the vast thicket of coral at the bottom. One after another we took a dozen yellowtails and sheepshead, weighing from three to five pounds each, and some smaller fishes that went for the bait as soon as it touched the water.

It was not great sport. It was more of a test of patience and muscle, standing in the narrow cockpit, balancing to the motion of the rocking boat, casting with difficulty, and now and then pulling in a fish hand over hand. Still it would do. The fishes flopped about pleasantly in the bottom of the boat, among two or three empty cans down there, and the great expectations of getting hooked to something that would serve as a tug, or of bringing some wonderful piece of coral structure to light, kept anticipation at par till lunch time, when there was needed relaxation.

At 1 o'clock I noticed that the wind was increasing, and saw several cat's paws chasing each other over the surfaces that were comparatively smooth in consequence of the deep water between the nearly exposed reefs about us; also that the sky in the northeast was rapidly thickening. Johnnie remarked with the *sang froid* of an old salt that there would likely be enough of that to belly the canvas, and I came to the poetical conclusion that

"The rising gale, and breaking foam,
And shrieking seabirds warned us home."

"Come, Johnnie, we've got to get out of this."

"Ay, ay, sir; and I think your little cedar Bride of the Southern Seas is going to have a lively walk up to the Sound."

In a very few minutes, and none too soon, the sails were hoisted, and we were skimming over the rapidly rising waves at great speed. It required consummate skill to avoid the reefs, keep in the tortuous lines of clear water, and at the same time give due attention to the breaking swells that rolled shoreward with immense power. But the boy's practiced eye saw by the differing waves and constantly varying hues, green and dark green, where the water was shallow and where it was perhaps a hundred fathoms down, just where to go. The sea quickly became very rough, clouds of mist and three-minute showers swept by, sometimes almost hiding us for the time, and the boom of the surf came like signal guns over the sea. In spite of every care in bounding over the crested waves, sheets of salty spray washed the deck, compelling us to close the hatchway, excepting space to stand in, and take frequent dashes with such equanimity as we could command.

The unexpected is always happening, and so it came about this time. The mast was not well placed, and there was room between it and the deck to admit considerable water whenever a big wave broke over the bow, which was taking place with considerable regularity. Already it was beginning to show in disagreeable quantity inside, where there was a large and sufficient quantity of iron ballast. The wind increased to a gale and the boat attained immense speed, while perhaps one-third of the little deck was at times submerged as we plowed the turbulent brine. It was impracticable under the circumstances to attempt to reef or bail; there was nothing to do but to trim the boat as best we could by our own weight and let her go. And go she did, keeping her head well up, in spite of the weight and plunging motion of the surging water now in the hold.

Two miles from the shore of Great Sound, the nearest land, we passed a British steamship at anchor, an officer of which seized a trumpet and called out:

"Ho! bo—log—oh! Come abo'!" or something equally intelligible.

"Johnnie, shall we climb up here and let the Bride of the Sea rest a little?"

"It's only two miles, sir. She'll not fall short."

"All right, but I'll take this hatch cover and you can have that board floating around down there if the Bride gets discouraged and goes under."

Even two miles is a long distance under some conditions, dismal to contemplate and cause of impatience. The water is merciless always, the winds never care for consequences, and there is a total depravity of inanimate things that excites exasperated comment, if the solemnity of the occasion does not forbid. The situation was rather hazardous to be regarded in the light of adventure. The island scenery was beautiful, the sea was imperiously grand, and there was much to engage the attention of those who love to wrestle with excitement; but these points were mostly ignored at this time; they did not engross thought to the exclusion of the still-distant shore and a cranky boat.

Conversation had now died out; there was no necessity for questioning; we had reached the buoy-marked channel in which the steamers come and go, and had plenty of room. But here the sea was still more violent, the boat plunged badly, like a fox-hunter in a bog, and then it settled down until it was a good deal like a dilapidated catamaran.

The boy was cool, and attended to his duty without a quailing eye or a trembling muscle. It seemed as if the little craft would have to go down; the jib was splashed to the top and half the mainsail, while the crazy boom knocked whitecaps into smithereens. It was a problem of distance and quantity—for instance: will this dumpy boat take in three more barrels of water, and disappear before it goes a mile and a half? and if so what will be the remainder?

In spite of the big cargo of salt water, our speed was kept up, the jib-boom did not go under, and the boy stood on the slippery deck with the resolution of a hero. In a tremendous surf along a coral point the little ship seemed to have lost its brave demeanor; it trembled and wavered on a huge crest, hesitated, careened, then settled down to one more determined effort. Johnnie took advantage of the moment of life, ported his helm skilfully, and the Bride of the Sea with a sigh at the mast head and a groan at the keel, gave up the ghost, and the crew sprang to land!

The boat was barely submerged, and it did not take long to work her up to a friendly ridge of coral, into a position that enabled us to bail out most of the water, which we did by disrobing and careening the boat, and using a tin bread-box.

"She didn't want to go down," said Johnnie; "you don't know, sir, how one of these boats hates to give in. It's the first time ever one got out from under me, and I've almost lived in 'em."

Then we had a comfortable sail, winding about among the pretty islands of Great Sound, over into Puget's Port and finally to the mirror-like sheet of water at the tranquil little town of Hamilton JEROME BURNETT.

CAMP FLOTSAM.

XVIII.—IN THE WAKE OF THE NETTER.

THE first week was nearly gone and we had tried the fishing but once. Into that brief period enough of tragedy had been thrust for a summer, and our thoughts had been little turned toward sport. Besides, the days had been of alternate storm and camp building with the first predominating in the ratio of three to one. From a drouth of six weeks duration in the vicinity of New York, with no signs of the end, we had come, to find in the great lake basin, an era of almost daily rain. There is, however, nothing unpleasant about a camp in the rainy season—at least there should be no discomfort in a well appointed one—and the fishing goes on about as usual. This enjoyed to satiety, we prefer the warmth of a camp and the drawing of a book, though it be in the presence of mountains, to rushing Lear-like through the forest aisles, defying the storm and coming in forlorn and bedraggled.

In the early forenoon of the day after the arrival of the Colonel and Captain, we were caught in a sharp rain, in the open lake, on our return from a visit to their camp. Everything looked propitious for sport, so dropping in at our landing for a rubber coat and blanket and securing a rod, we headed down along the island. Not twenty rods from our camp a small-mouth took the Canada just as it struck the water, and went off with a grand rush. We had just brought it to when another took the Professor, and there was a circus on the starboard for a minute when the gut snapped and the Professor and fish were lost together. The Canada held its own and soon, with much splashing and leaping, the landing net was holding a two-pounder. As if in salutation of the event the rain broke out once more with a double header, and, not wishing to open a fly-book in such a deluge, we tried the Canada alone. Another strike greeted it as it dropped, the old battle was fought over and a mate to the first with a severed vertebræ was quivering in the boat. Another cast, another rush and strike, a sudden feeling of goneness on the Mitchell rod and the Canada fly had followed the other, perhaps to grace with it some hall of the Microptera, in the depths below, where the trophies of escaped bass are preserved, mementoes of the cunning and vigor of the heroes of their race. Then, in spite of the rain, we tried a new cast, this time a great king and scarlet ibis, for not a light fly could we find about us, all having been left in camp. With these we kept on our course, following the edge of the great weed bed where last year we took many a lusty beauty. It was soon evident that the light flies were the killing ones for the morning, but, by the time we had made a circuit of the island, we had added eight to our stock, taken two big pike without injuring a snell, besides throwing back half a dozen small-mouths of a pound apiece. A little after noon the sun came out and it grew clear and warm, so we started for camp. As we turned into the bay toward the landing, we caught sight of Sabattis working along the point below. In answer to our hail the old man pulled up to the camp and was refreshed with something from the Madame's medicine box, which he appeared to relish greatly, after which he entertained us with the account of his winter's trapping, and promised his hostess a dozen mink skins from his next winter's catch. Dinner over we sat through the afternoon watching the sunlight shift on the treetops along the southern hills, and the waters turning to gold under its setting. That night we missed the fragrant smudge, for the song of the mosquito was hushed; the camp fire burned brightly and all the glamor and poetry that comes from the wilderness and the lake gathered around us and, more than once, we found ourselves wishing that it might last forever. Our sleep that night was haunted by a miserable dream, a nightmare, which for years has mingled itself with our slumbers in camp, a dream of finding ourselves at home with our outing suddenly and mysteriously at an end. It is happiness to awake and be assured by the sound of the water upon the beach, by the rustling of the night wind among the trees and by the cry of the loon, that the treadmill of life is wearying other souls and its Juggernaut rolling over other bodies than your own. You are free, the soft flicker of the patch of moonlight on the canvas tells you so, you turn toward the dying camp-fire, close your eyes, and an adamantine wall rises between yourself and care.

In the morning a heavy wind was blowing from the southwest, beating up the whitecaps in front, and the waves were running high up on the sand beaches and dashing against the rocks. The signs were not promising. Nevertheless, we started out to cast over the ground where, on the first day, we had broken the rod. A few small-mouths took the fly from sheltered stretches of water, but it was hard work to lay a fly anywhere, so we soon gave it up and headed over toward Sabattis's for a visit. The great head of the house had seen us approaching and was waiting at the landing to receive us, and while the Madame proceeded to the cabin to pay her respects, we were initiated into the mysteries of birch bark canoe building and given an exhibition of how a canoe could be handled in rough water. We served an apprenticeship of an hour or so and then sounded the signal for the Madame, who made her appearance, followed by the niece of the old Long Lake guide, Mitchell Sabattis, and her daughters. At the boat one of the latter presented the Madame with a curiosity in the shape of a loon's egg, which hangs in the den among our Canadian souvenirs, an inspiration like that of the great roc's egg in the palace of the Genii. Before we left, the old man set us agog with a story that seven salmon (*S. namaycush*) had been taken above the bridge, about ten miles away, within a week, and we thought with a thrill of joy of the two trolling gangs which we had brought with us, the generous gift of "A. N. C.," that we might be properly prepared for the sport of which he is a master.

There was yet one thing wanting to make up our camp. A flock of chickens had not yet been secured, although many fruitless inquiries had been made. But from Sabattis we learned that in the spring he had seen some fowls in passing the house of a dweller on the lake, about four miles from camp, and it might be, he said, that we could procure a few from him. There was too heavy a sea on to undertake the voyage that day, so it was postponed to the morrow. In the morning the sky was without a cloud and it was like a mellow October day. The air was fragrant with the breath from the pines, and the faint, delicious odor from the Colonel's fire was wafted to us across the water. Slowly we pulled down the lake on our quest, keeping close to the eastern shore and halting now and then to cast over a suspicious looking place. But nothing rose to our flies, and after a couple of miles we crossed the main water to the north shore. Here, among the islands, the bass rose eagerly to the Lord Baltimore and Professor, and twice we took two at a cast, but the run was small and we threw them all back, for we were really after chickens and not bass. Two miles further on we found the alleged poultry dealer, or rather his wife, but no chickens. "The spring," she said, "was late, and it would be two weeks before any would be large enough for the table." Promising to call at the end of that time, we put off for a log house a mile further up, but here nothing could be found, so we dawdled away a couple of hours in casting and taking in small bass and returning them again to the water. We followed the ins and outs of the north shore through a long strait which was separated from the main water by a chain of islands on our left, with here and there a spring brook tumbling over the rocks. Keeping in the shade of the trees on the islands, we kept slowly on, indulging in an occasional cast, which was certain to come home weightless. The rocky shore, with its wealth of fallen trees and coating of ferns, with slender cardinals looking down upon congregations of white-robed lilies, brought back the memories of many a day on the Ramapo and among the beauties of the upper Delaware. Mingled with these came the memory of escapades from the teacher's rule when in the old scow on the mill pond, we sat under the big oak and tempted the sunnys through the long afternoon, with never a thought of the bitter accounting in store for us at eve.

At a point of rocks off the upper end of the last island of the chain, and where the strait opened into the lake, we had a short, sharp contest with a two-pound small-mouth, which terminated greatly to the disadvantage of the latter. A boat-length further a big-mouth, wrapped in admiration of the Professor, involved himself in a difficulty from which we extricated him in the boat. Before we reached the deep water three small-mouths and another big-mouth had joined their brethren at our feet, and we felt that, after all, chickens were not the all-in-all to a camper.

It was well toward evening before we were back in camp, and night was settling over lake and forest by the time dinner was over. The Colonel and Captain were soon on hand, and we reviewed the career of FOREST AND STREAM and sat in judgment on many a correspondent, from the self-willed "Nessmuk" to the gentle angler who made his exit with the storm at Carp Lake. The Canadian netter and fish hog was discussed in various lights, together with the future of fishing over the border. One thing is certain: unless more active measures are taken to enforce the laws and protect the bass by further legislation, the day of good fishing in every inland lake within reach of market will soon be over. Lake after lake has been skinned of bass by means of hoopnets, set pretendedly for catfish under a license, but in reality for anything that can be taken. The wonder is—and the wish is its father—that some Indian or settler in the backwoods does not dispose of the netting difficulty by a charge of buckshot applied at the proper time. The netting in Rice Lake, though under a license, was quickly broken up by the Indians, and it requires only a little backbone on the part of residents along the lakes to put an end to the calling of the netter. Why the few residents on the backwoods lakes of Canada, who themselves only take enough fish for their immediate wants, should be expected to stand quietly by and see a stranger net their waters for his own gain, whether with or without a license, whether the netter be "from the island" or elsewhere, is a question which we think they will soon answer for themselves, and, probably, with something harder than protests or petitions.

With us, in the thinly settled localities, the solution must needs be more heroic; kill off the game, net the last fish and put the pot-hunter and netter at rest by depriving him of his means of livelihood. It is useless for decent law-abiding sportsmen to attempt the protection of fish and game by legislation or to stock waters. The effect of the law is, to prohibit them from enjoying the fruit of their own labors, while every hoodlum and gutter-snipe reaps where they have sown. No, clean out the game and fish, and let the pot-hunter and netter philosophize over the cause and effect of the silent woods and barren streams upon his vocation, and let the sportsman, since he must pay, seek his preserves or the backwoods, and the pot-hunter and netter, deprived of his victims, will soon drift into some other occupation, equally fitted to his nature and tastes, but for which the laws of men and civilization have provided the penitentiary, and thus he will have his reward.

With dissertations such as these we sat the week out—for it was Saturday night—the Colonel beside us on the low bunk with the "ki"-dog between, the Captain in front grave and meditative over his pipe, and the Madame perched upon her high couch opposite, while on the right the remnants of the well-discussed banquet "did coldly gleam" in the shape of canned shrimp, sardines, and cheese. When at last they took their leave we could hear their voices in conversation during the whole of their homeward trip, and after they had reached their camp, a full half mile away, the tones of their voices came plainly to us still.

On Sunday morning, the camp put on its holiday attire and took a rest. The week had furnished enough of sport, although never was there a brighter day or a more glorious ripple on the water. Before the day was over, our student friend of last year, whose entertainment of us at the bridge was one of the red-letter days of the camp, had taken our hands in his and greeted us with his olden smile and welcome. He was now a Senior in Queens University and was spending his vacation at his home, six miles up the lake, from whence he had that morning run down in his sailboat to revive to us the pleasant acquaintance of last year. The flame of the ancient friendship was ablaze in a moment, and he in turn was welcomed with all the welcome which the American camp could extend with all its arms. Through the remainder of our outing our meetings were frequent, and to him we became indebted for much that made it what it was, for kindnesses which it is our regret that we can never repay.

The Colonel and Captain joined the group, which well nigh filled the tent to overflowing, and the afternoon went quickly and merrily by, to the time of the departure of our visitors.

In the middle of the night the wind rose, and the heavy waves began to pound on the beach below, while the canvas tugged and strained at its fastenings with a violence that threatened to pull the tent pegs and hurl it into the woods. Soon a pouring rain added to the rumpus without, which, with the fall of a slab every now and then from the cook's breakweather beside the range, made our sleep one of fits and starts. But our covering held its own, the roar settled into a steady monotone, and "great nature's second course" at last settled upon us all. WAWAYANDA.

SOME POINTERS ABOUT DUFFLE.

I HAVE read "Woodcraft" and in the main agree with the veteran camper, its author, upon the essentials for a trip in the woods. I, too, believe in "smoothing it" as much as possible. I can see no virtue in a man's making a martyr of himself, going without the things he needs when he can have most of them at least, with a very little extra labor.

One's outfit should always be made up with a view to the locality of the camp.

Were I going an hundred miles beyond mule road, I should go as light as "Nessmuk"—think I should even throw away the "ten cent tin"—but if one is going to a camp accessible by team and boat, I see no object in limiting one's cooking and eating tools to four or five pieces of tinware and other articles in proportion. For five successive seasons I have camped in the Adirondacks of New York, in a camp within five miles of which a team can be driven and there is good boating by river and lake the rest of the way. I have studied the matter of duffle not a little, and as I think to some purpose, yet after all has been said upon the subject, each one will decide for himself after a trial and govern himself accordingly.

Many of the Adirondack guides furnish everything except the personal property a person needs. I prefer to own my traps—there is a deal of pleasure in looking the things over during the January days with the mercury gone on a winter trip down below zero. And then I don't like the average guide's profanity, if his rusty kit gets smashed. There is a heap of fun in smashing one's own furniture.

My cooking kit, when packed up for a start for camp about July 28, 1885, had the innocent look of a large tin pail with cover. There is the large pail, that's for water or fish, or packed full of venison steaks it goes in the cool of the spring. In the bottom of the pail aforesaid we find a dozen tin plates just fitting the pail; four palls are taken out, each nesting so that no room is lost. In the smallest pail is a large coffee pot of sheet iron, riveted together and rigged with a bail to hang over the fire; in the pot are a dozen tin cups, two sizes of spoons, knives and forks for the party. Inverted over the tinware in the large outside pail, and just beneath its cover, I have a four quart basin and a sheet iron frying pan with a detachable handle. This handle is five inches long and made with a socket to receive an extension of wood when in use.

With this line of crockery I can spread a table for ten persons, give each a knife, fork, spoon, plate, cup and sauce dish (don't laugh, the sauce is only maple syrup), thus removing from the woodland meal most of the signs of roughing it. The tin baker is next in order. This I utilize on the way in and out of camp, as a tin trunk. In it I pack cartridges, tools of various kinds, extra clothing perhaps, put a strap about it, and it handles as well as a drummer's sample case. Some campers have not caught up with this tin baker perhaps. Mine is made of heavy tin of the following dimensions: 17 inches long, 11 inches wide in front, and 5 inches wide at back. The art of making is in getting the proper angle of the upper tin surface to the lower. Made in this way with sheet-iron pan one inch deep hung in the center, I'll warrant it to bake a mess of biscuit in ten minutes by the watch, or cook a roast of fish or fowl or venison, as quickly as the modern range. After the meal it makes a good dishpan, a minnow crate, or pork barrel.

I like the shelter tent pretty well if I cannot get a bark lodge, but of all the habitations man hath yet made with which to cover his devoted head upon a summer outing, give me the bark lodge both now and forever. A little experience will enable any man of gumption to build one that will not leak in a pouring shower, and you can build your fire near home and go to sleep without fear of a conflagration before morning. And I like a place where I can drive a nail and dispose of my effects in a convenient if not picturesque way; the rafters of the bark lodge are just the thing for this.

If you are going to the Adirondacks don't omit the pack basket, "Nessmuk" to the contrary notwithstanding. Do you think that every guide in that glorious region would carry one if the wisdom of man had yet discovered a better thing for the purpose?

A knapsack will do for blanket and rations, provided you want hash made of the latter before you find the hither end of the carry. A very common cargo for the basket is the meat of a deer, a blanket, extra coat, hatchet, rations, jack, oil and whatever else guide and sportsman think necessary for a three-days' tramp for the home fire.

A basket properly made and strapped will not chafe nor hurt the back. It puts the load where it is least in the way and upon the muscles best able to carry it, and it won't wobble about and churn its contents like the knapsack.

Upon my last trip I had a bit of experience with a piece of duffle that may be of use to some one. Every outer has found difficulty in finding the proper covering for the feet. I had tried all the anti-friction-easy-for-the-feet boots and hoes on the list. I concluded to try a pair of "oil-tanned moccasins." I bought a pair. They were not beautiful to look upon, but were well made and according to order. I stoically endured the jeers of the boys over my "hen-skin" shoes on the way to camp. Arrived there I hung them on a nail in the lodge, and soon turned in. About the first sound I heard after that was a shout from Bill, "Say, boys, look at the hen skins." I opened my eyes and looked. My beautiful moccasins had turned two shades darker in color, and had the appearance of having been soaked for a week in strong brine. Moisture stood in drops all over them; in the hot sun it dried off, but those things were wet whenever they were left in the shade or a place at all damp, wet inside and out, wet all the time of a three weeks' trip, and are wet yet when not in a place hot enough to bake. I vote oil-tanned moccasins a delusion and a snare to the outer of the Adirondacks in the month of August. If any one is disposed to question this I have a pair upon which he can experiment by paying the freight. The best foot gear for all kinds of weather and all kinds of tramping that I have found is a pair of French kip boots, hand made, and fitted over two pairs of socks to insure their being large enough.

An outer is likely to be a lover of boats. Upon my last trip I took in one, a description of which may interest. She is of the lapstreak class, built of best quality of cedar clapboards, elm ribs, oak keel and stems, spruce gunwales, decked over at bow and stern twelve inches. She is 10½ feet long, 29 inches beam, 9½ inches rise at center and 17 inches at the ends. With yoke and paddle she weighs an even thirty-five pounds. She carries her skipper and a friend in the bow, and if necessary a hundred pounds of duffle; or trims beautifully and handles nicely with one person. The boat is of fine form and her lines are elegant. Her workmanship is superior to any of Rushton's boats that I have yet seen. For a boat for many purposes in the woods she comes as near the ideal as any I have yet seen. She got some hard knocks, but came out solid as when she went in, and now hangs in the woodshed patiently waiting the coming of another summer vacation. A man of ordinary muscle can carry this boat anywhere in the woods, and take on some extra duffle besides. When he gets to navigation the boat takes all on board, is big enough to float in, and small enough to carry.

Speaking of what a small boat can do in the way of cargo reminds me that in August, 1884, myself, guide and two other men, with three packs and two guns, made the length of Albany Lakes, Brow's tract, through the Beaver into Smith's Lake in a boat weighing only 35 pounds. This was a case of necessity, but it involved no danger and no especial inconvenience. I have that boat yet. The only thing about her that is peculiar is her great width of beam in proportion to her length—length, 10 feet 8 inches; beam, 36 inches. The load referred to could not have weighed less than 700 pounds. Neither of these boats is fast; they are not racers. Time is of no account with the camper, at most, not so much as the ease he seeks and the recreation he goes to find. I don't quite like the double-bladed axe, but I'm not sure that I have anything better to offer. Surely not now. NITRAM.

THE VAMPIRE OF THE OCEAN.

THE articles in your issue of Dec. 10, "Capture of a Sea Devil," and Dec. 24, "The Devil Fish of Estero Bay," induce me to contribute my mite of information concerning this curious sea monster, whose very existence is regarded by many who live beyond the smell of the salt sea foam as mythical.

Few are they who, on looking at the chart of the Carolina sea coast, would not be struck by the magnificent expanse of the harbor of Port Royal, crowded on either side by innumerable small islands, once the pride of their old possessors, the Sea Island cotton planters. The thousands of small creeks and inlets formed by these densely wooded islets are a favorite resort of immense varieties of fish, which have always repaid with good sport the assiduous attentions of the gentle art. To find subsistence easily and abundantly is an impulse that pervades all animal life. So hither came the devil fish to get his fill of the small fry that crowd these waters. I use the past tense, for, *mirabile dictu*, the fish has not been seen in the neighborhood for several years. He is a great lover of quiet and solitude, which this harbor afforded until Dupont aroused the slumbering echos of this mimic sea with his screaming shot and crashing shell, from which time dates their gradual disappearance, thereby expressing supreme dislike to a home obstructed by the cables and rendered disturbing by the noise of crowded shipping.

After satisfying the cravings of his appetite in the smaller and more inland waters the devil fish would betake himself to the broader waters of the bay and there disport himself on the surface, probably by way of a "constitutional." It was here that the gentry from the plantations would seek them for the indulgence of that favorite but dangerous sport, devil-fishing.

Elliott, in his "Carolina Sports" (1854) claims to have been the inventor of this sport of harpooning devil fish, and to have been the first to capture any number of them, which is probably true, and indeed it could not have originated from the hands of a more worthy sportsman than

> "Elliott, early trained, with easy skill,
> Old Walton's various offices to fill,
> The sport to lead, the willing ear beguile,
> And charm with rare felicity of style."

To all who are so fortunate as to possess this rare and valuable addition to their library—"Carolina Sports"—he is the ideal of the gentleman sportsman, although the moss of thirty years covers the stone beneath which he rests, and the crack of his Manton among the oaks and palmetto thickets of the Sea Islands have ceased "lang syne."

The mode of capture was as follows: Harpoons somewhat smaller than those used for whaling purposes were the weapons used. These were charged at the butt with a wooden shaft six or seven feet long. The line attached to the "eye" on the "shank" of the harpoon may be at least one hundred and fifty or two hundred yards long, according to the size of the boat. With his lines carefully coiled in the bows of his boat, and harpoon in hand the "Piscator" would sally forth to the favorite play grounds of this sea vampire, rowed thither by four or six stout oarsmen if the barge is as it should be, twenty or twenty-two feet long. The first sight of the game is a black bat-like wing thrust four or six feet above the wave, like the mystic arm that reached out to grasp Excalibar, when thrown into the water by Arthur's dying request. Anon he skims along the surface of the brine like a huge inverted dish cover, turning over and over in his gambols. We see for a while his shining mottled stomach, then his dark and slimy back. You are now near enough to strike. Straighten yourself. Throw your arm well back with weapon grasped a little back of midway and at an angle of forty-five. Then pitch it point foremost with all the force you possess directly at his back. Or better still—we have come upon "him haply slumbering on the Norway foam," stomach up and back down, spread out like an immense dirty blanket on the surface of the deep. Now is your time. Grasp the shaft in both hands and plunge your steel deep into his vitals until you feel it go through. Step carefully down from the forward thwart, bearing in mind that your foot must not get entangled in the line, and laying hold of the line, but not too tightly if you value the natural covering to your fingers; seat yourself down firmly, for directly you are going to move. All this in a few seconds.

The fish has recovered from his momentary shock. With a gurgle and a splash he starts off at lightning speed. The line is run out with frightful rapidity. Mark how the smoke rises from friction of wood and hemp. Increase the strain on the rope if the toughness of your hand will allow you; he is out far enough, and it is time to make fast. Call on Scipio Africanus (begging the shade of that warrior many pardons) behind you to lend a hand and wind the slack around the cleat. Away you go, twenty miles an hour, right out for sea. He appears near the surface with harpoon well fixed; floundering and splashing for a moment he disappears in a bed of foam, straight downward, dragging the bow a foot under water. The line again slackens and he again rises, this time not in front of you, but right under you. You see five feet of reeking wing spread out on either side of your craft, deliberately flapping in water by the barrelful. Well for you that it does not last long, before he is off again, with a few more wounds from your rifle or else from the old bayonet you have attached to the end of a pole. At last he has given up, after pulling you ten or fifteen miles outside. On the approach of flood tide he is towed toward shore and beached at high water mark.

We now measure him and find he is 17 feet from tip to tip of his wings; length to base of tail, 10 feet; to end of tail, 16 feet. This was about the measurement of the last one seen by the writer just two years ago. The scientific description of this devil fish is given in the "Zoölogy of New York," by James E. DeKay. Albany: 1842:" "Family Raiidæ, genus *Cephaloptera*, Dumeril. The pectorals produced into long processes at their anterior extremities, presenting the appearance of two horns; teeth slender, with a serrated spine." This latter description is somewhat wrong, as the devil fish has no serrated spine, like a sting ray or a whip ray, but only a socket which looks as if made to recieve one of these formidable weapons. "The Sea Devil (*Cephaloptera vampirus*). The vampire of the ocean, Mitchell. *Cephaloptera giorna*, Lesueur." Then come the characteristics which state that the tail is longer than the body, which is another error. Of all the specimens caught in this section, the length of tail compared to that of the body was as six is to ten. The color is a blue-black above and white varied with dusky opaque clouds beneath. Thickness, between three and four feet. The two horns, or rather feelers, with which he sweeps his food into his mouth, grow from near the eyes, which are on top, tail coming to a blunt point.

An article which came out in some of our American papers concerning one of these fish which had been caught near Galveston, I think, and stating that it was one of the few ever caught, caused some amusement among our native sportsmen. The father of the writer has captured some twenty or thirty himself, as have several other gentlemen of this vicinity. The sport could not be placed under the head of willful cruelty, as the fish were always cut up in lumps about four feet thick and carted up into the cotton fields by the planters, and there used as manure. The liver furnished an excellent lubricating oil. The devil fish is no longer an object of sport here, for, as I have said before, he has entirely disappeared. He may yet be caught probably on the west coast of Florida. I should dislike to try that gastronomic feat of eating steaks cut from one of these creatures, as performed by one of your correspondents.

The last one was seen here two years ago. This individual got entangled in the piles of a wharf and was taken. The same waters are here, the same swarms of small fish come and go with the tides; but for us the *Cephaloptera vampirus* has vanished beneath the waves of bygone years and his wake is no more seen. *Sic passim.* WILD DRAKE.

A SHAMEFUL FASHION.

A THING of beauty is a joy forever, is an accepted saying, and yet a thing of beauty, when distorted and out of place, becomes an actual source of distress to thinking people, and people of fine sensibilities. It is customary to compliment the fair sex under all possible conditions, but for the present distorted taste or fashion, which trims nearly every woman's hat with some form of a dead bird, there is no word of commendation or excuse. A bird's wing is beautiful as it cuts the air, bearing a joyous bird in freedom among the trees. A live bird is beautiful, but ten thousand dead birds with glass or waxen eyes, withering beaks and shrunken skins, perched above the noses of ten thousand women are anything but a source of joy.

Look at the display of the millinery windows of to-day—dead birds to the end of the chapter! An importer of millinery informs me that the demand for some form of dead bird is enormous. A thorough system of collecting tropical birds is in operation abroad, extending even into Africa and Australia. Besides, the killing of sea swallows and other handsome plumaged but dull-colored birds in this country, and sending them to France to be dyed, is appalling, to say the least. "Look about you," he says. In doing so what do I see? Six women out of every ten have some form representing a dead bird on their hats. It is natural to fall to calculating. There are over 50,000,000 of people in this country alone, and fully half of them are of the dead bird wearing gender. But few are too young or too old to wear dead birds. Allow us only 10,000,000 females wearing bird corpses in the United States. Give us 10,000,000 for England and 10,000,000 for France, and take all the rest of the fashionable world to make our estimates good. What have we found? That 30,000,000 forms of bird life have lately been taken to deck out the hats of women. How long can the bird life stand such a strain? Does not utter extermination stare it in the face?

No wonder an anti-plumage society has been formed in

England. But the London *Telegraph* makes light of it, declaring that such movements are only vapid and soon disappear, as the vanities change, and flowers and grasses take the place again of bird plumage upon clothing. In its stilted wisdom, that paper asks, "What is a bird after all, any more than any other form of animal life?" Nothing to a paper or an individual destitute of a love for the beautiful. If the bird hunters would turn bird raisers and propagate the beautiful forms they traffic in, then the lover of bird life would have no right to complain of his taking the lives of such as he had caused to multiply. But when his nefarious business is exterminating the beautiful forms nature has placed in the groves and fields for the good of everybody, then it is time for an anti-plumage league in America.

"If ladies chose to wear sparrows would anybody protest?" asks the London *Telegraph*. Is a sparrow—an English sparrow is doubtless as far as the *Telegraph* ever looked—is an English sparrow a thing of beauty, a bird of song? To the lovers of bird life, beautiful and tuneful birds, this wholesale destruction of fashion is something wicked and terrible, and the sentiment which fosters the London *Telegraph* would send us nothing but dirty, querulous English sparrows in return.

But to one who has made a study of bird life—its forms—none become more exalted. No form of animal life, with the possible exception of the dog, comes so near the highly-organized human. Listen to the bird song! Is there anything gross there? Does it not rather point even higher than the human? Take the little bulfinch, for example, trained by the German shoemaker to pipe a tune, note by note, with perfect accuracy. Note how he raises every feather, quirls his little tail to one side, hops coquettishly from side to side, strikes his note and pipes away, and then answer me if his little life is not a higher one than that of the seal, whose blubber case is so much sought by Fashion's votaries.

I have a parrot which invariably salutes me with a pleasant "How are you!" whenever I enter the room. When I put on my coat to go out he says, "Good-bye, good-bye!" There is owned a parrot in Brockton, Mass., which speaks some 200 words and uses very many of them in the right place. "Oh, but," I hear you say, "that is all imitation; somebody taught them to do it." Very well, how did your little son or daughter learn to talk? Was it because somebody taught them or by sheer imitation, or both? The mere power to imitate to such an extent as mentioned above, shows a nearer approach to a human soul than there exists in the lower forms of animal life. I believe the bird life, for which I plead to be as high and noble as its powers of imitation indicate; as its plumage is beautiful; as its wonderful mechanical powers exhibited in nest building show; as its song is charming, so does its little soul extend—then who can blame me if I deprecate the vain, soul-lacking fashion which takes bird life by millions and attaches the withering skins to her dress, thinking it to be an ornament. SPECIAL.

THE RABBITS OF ONTARIO, CANADA.—*Editor Forest and Stream:* In the column devoted to "Answers to Correspondents" in FOREST AND STREAM, of Dec. 31, 1885, occurs the following: "Rabbit, London, Ont.—Around this part of Ontario we have the little cotton-tail rabbit, and a larger kind we call hares; both have the brown coat. I have seen both on the same day and as late as Christmas, when there was deep snow on the ground for several weeks before. We have also the white hare here, but have not noticed them around before February or March. Are these different rabbits, or does the large kind change its coat after the first of January? Ans. The cotton-tail (*Lepus sylvaticus*) is a hare different from the common American large hare (*L. americanus*), which changes the color of its coat in the spring and fall. A third species is the great northern hare (*L. timidus*, var. *arcticus*)." The above reply, though non-committal, is misleading, because it certainly implies that the white hare mentioned by the correspondent might have been the Arctic hare, which species has not been found within many hundred miles of London, Ontario. It is not known from Lower Labrador even, and Newfoundland constitutes the southernmost limit of its range. The white hare of Ontario is the common varying hare (*Lepus americanus*) in winter pelage. —C. HART MERRIAM.

ALBINO SQUIRRELS.—During the years 1875-6-7-8, in the southwestern portion of Waupaca county, Wisconsin, there was quite a colony of albino squirrels in a somewhat flourishing condition. These were about the size of the black variety, from which I think they originated. It was a common occurrence for the sportsmen in that locality to shoot white squirrels while hunting. Several were kept in confinement as pets near where I resided. A nest of them was found in 1876 which contained three young—all pure albinos. The entire family were captured and kept in confinement for some time. Their color made them so conspicuous that they were noticeable for some distance, and were constantly shot by the gunners, that now I believe they are exterminated. The last one I have any record of was captured in October, 1880. In a letter from Prof. Baird, in 1882, relating to the above he says: "It is not impossible that by a sort of natural selection among the descendants of a single white parent, a white race may be established that will be white for a time and populate quite an extensive territory." The above is undoubtedly the true theory of the origination of this colony. It is a pity that this colony was exterminated so soon, as the chances are that quite a territory might have been populated from them.—C. F. CARR (Madison, Wis.).

THE GROUSE'S DRUMMING LOG.—Ferrisburgh, Vt., Dec. 31.—*Editor Forest and Stream:* In response to "Keouk's" inquiry, I will say that of the few drumming logs I distinctly remember the position of, one lies nearly east and west, one northeast and southwest, one about north and south and another a little west of north and east of south. One rock was a favorite drumming place for one cock that I watched, and I remember flushing another from a rock when he was drumming. The strike of the ledges here is nearly north and south, but the rocks on which these two were drumming were considerably higher than the ledges in which they were situated, knobs in the ledge.—AWAHSOOSE.

A SWAN IN MASSACHUSETTS.—Boston, Dec. 27.—The passengers on the Cape train were much interested over a wild swan shot in one of the Middleboro ponds. The bird was a fine large specimen, though a young bird, and made the Canada goose by the side of it look quite small in comparison. Is it not a very unusual occurrence to find this species so far east?—T.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Two macaque monkeys (*Macacus cynomolgus*), two cross foxes (*Vulpes fulvus decussata*) and one gray-breasted parrakeet (*Bolborhynchus monachus*); purchased. Four opossums (*Didelphys virginiana*), one red fox (*Vulpes fulves*), one raccoon (*Procyon lotor*), one golden eagle (*Aquila chrysaetus*), one great horned owl (*Bubo virginianus*), two screech owls (*Scops asio*), one coot (*Pelionetta perspicillata*), one jackass hare (*Lepus callotis*), and four green lizards (*Anolis principalis*); presented. Two lions (*Felis leo*), and five dingos (*Canis dingo*); born.

STRAY SHOTS FROM AN OLD RANGER.

DO I love to hunt? Well, I am now sixty years old, and have been quite intimately acquainted with myself for fifty years, during which time I have handled a gun and lost few opportunities to follow a dog in the proper season, in whatever locality my devious path of life found me; and without any reservation I cheerfully affirm that, outside of my own family enjoyments, this has been the keenest pleasure of my life; and I enjoy it to-day, with as keen a relish as at any time during the years that are past.

Why is this? can any one tell? Is it because I am cruel and brutal in my nature? I do not think so; and no one ever accused me of possessing these traits of character in all my life. My experience has been that of a true sportsman—he who enjoyed this sport in the most rational manner till every fiber of his being thrilled with a delight unknown and unfound in any other pursuit, was always a whole souled man, possessing the kindliest of natures.

Neither is it because I can get my birds cheaper in this way than to buy them in the market. The man who shoots for profit is no sportsman, and should not be countenanced as such, or in fact, any way, except under extreme circumstances. A man may be so placed, that there seems no other way before him in which he can earn a few dollars; in such a case I do not blame him for embracing this; but when a market-man, or a dealer in sporting goods, hires a gang of men as he would so many wood-choppers, and sends them out to follow up the various varities of game, and sweep over section after section of the country till there is hardly a bird left, simply that he may make a few dollars by their indiscriminate slaughter, he is no sportsman, but the worst enemy a sportsman has, and is pursuing a course that will soon entirely exterminate several varieties of game birds. Such men should not be encouraged in any way, but should be shunned by all true lovers of the sport. A sportsman's birds will generally cost him two prices, and often more. Although delighting in a good bag honestly won, he does not shoot alone for the quantity of game he can get.

I have been in a wild pigeon roost, and watched the birds fluttering and hovering among the branches of the trees until their weight would absolutely break them, without ever discharging my gun. I could have killed dozens at a shot; but that would have been no sport for me—I should have felt guilty of bird-murder in the first degree. I have had some of the most enjoyable trips of my life, when our daily bag would not exceed a dozen or fifteen woodcock, quail and partridge all told; and have been where I could load myself down with game, but found very little real sport. Like all good things in this life, it is, in part, the effort and labor in their acquirement that adds much to their enjoyable value.

I have hunted in various sections of our country, but nowhere have I derived so much unalloyed enjoyment as in a week's tramp among the rugged hills and vales of New England, where one has to work like a beaver to make a respectable bag. I firmly believe that if a stop can be put to the shooting of woodcock in all the New England States in July when the birds are half grown flabby, and not good, and when the hunter and dog both suffer from heat almost intolerable, and the birds he gets will turn green or get fly-blown before he gets in; and if the shooting of woodcock, quail and partridge can be rigidly confined to the months of October and November in all these States; and if the boys can be persuaded or prevented from trapping quail and partridge at any and all seasons, those States will in a few years afford the finest sport for these three game birds to be found in the land. There are a great many "ifs" in the way of producing my "happy hunting ground;" but when these changes are brought about, as they certainly should be for the preservation of game and the real benefit of all concerned, Connecticut, Massachusetts, Vermont and New Hampshire, particularly the first named State, will come as near the ideal shooting country as any I ever expect to find. A.

CHICAGO, Ill.

WESTERN MASSACHUSETTS.

THE shooting season just closed like that of the year before has been very destructive to the birds. In this climate cold weather and snow generally put an end to shooting soon after the middle of November, making the time for pursuit of game practically but two months and a half. But the past two seasons for the most part have been open and pleasant up to the very close. The entire open season of '85 furnished no more beautiful day for field sports than Dec. 30. The ground was bare while the magnificent floods of sunlight and the hazy atmosphere made it seem like a perfect day in an Indian summer instead of mid-winter. Every sportsman must have felt the influence of the day. The frequent booming of guns showed that many were out for a farewell shoot. The result of it all is that many birds have been killed that would have been left over under ordinary circumstances. Grouse shooting has been wonderfully good but it seems impossible that it can continue so much longer. So many guns are now directed against them and with such relentless persistency that the effect must soon be felt in a comparative scarcity of these splendid birds. It seems likely that the greater portion of the game is shot for market. There are a good many men in the county who shoot for the market, perhaps a dozen or twenty, including one or two of the best game shots in the country. They get all the way from fifteen to twenty-five hundred birds apiece according to their skill and the amount of time devoted to the business.

It is reported that lots of grouse are left in certain localities while other places are just about stripped. Early in the season excellent sport was to be had within three or four miles of the centers of Holyoke, Chicopee or Springfield, while from twenty to forty miles out, about as good shooting could be found as any one need wish.

Quail are not very plentiful about here and are regarded as a side issue. A fair flight of woodcock came about the last of October with the birds in splendid condition.

NONOTUCK.

HOLYOKE, Mass, Jan. 1, 1886.

"Forest and Stream" Trajectory Test.

(*Concluded from page 448.*)

WE have now set forth all the facts touching the several rifles placed in competitive test in the trajectory trial undertaken by and carried through under the auspices of the FOREST AND STREAM. There are a few other weapons which we would gladly have seen making a record side by side with those already in, but circumstances prevented us from securing them, and besides it was the intention, departed from in but few instances, to confine the trial to bona-fide hunting weapons. What those weapons will do, what may fairly be expected of them under similar or like conditions prevailing in the trial is now within the knowledge of all our readers. We feel certain that there will be a period put to much of the imaginative writing which has been so much the fashion on this subject. Here in our tables may be found a body of facts deduced from actual experiment. They are worthy of much study. To look at the trajectory averages and them only would be very misleading. They should be looked at in connection with the table of powder charges and proportion between powder and ball. We expect a flat line of fire from a charge where the proportion is 1 to 1 or 1 to 2; but is it after all worth the punishment of person and the waste of material to get the very slight advantage in accuracy and flat fire line? To make practice and theory come together may be intensely interesting to the rifle virtuoso, if we may use the term, who finds a certain keen pleasure in using the experimental range to verify his theories, but when it comes to the practical question of buying a rifle for use, there are other matters to be considered, and it is to afford some light to this large class that our trial was started and carried through. We have found that our results correspond with those reached by theory, but it was manifestly impossible to subject each of the rifles offered to the tests necessary to get the elements of the formula used in deducing the trajectory heights. The simplest method and most satisfactory, we feel sure, to the majority of our readers was that which we pursued, taking the weapon, loading and firing, catching the record of the fleeting bullet upon the gossamer tell-tale screens interposed. It is interesting in this connection to make up a series of supplementary tables from those in the 200-yard test. Here between the 50 and 150 yards screen we have a 100-yard range with a midway screen. A new 50-yard height of the bullet in progress can readily be calculated, and only serve to verify the results at the lower range.

Take for instance the Winchester .50 solid ball. In shot No. 1 at 200 yards, call screen at 100 yards the target: 11.305+3=5.652=base line on 50-yard screen. 7.727—5.652=2.075, which is the curve for that shot. The other four shots show the following curves on 50-yard screen by same method of calculation: 2.296, 2.583, 2.243 and 2.480. This gives average for the five shots 2.335 and this may be used as a basis of comparison, in place of the figures actually obtained in the 100-yard test. The same computation with the Winchester .50 express bullet, taking the 100-yard curve from the 200-yard test, shows an average for the 50-yard screen of 2.351, which almost exactly coincides with the result of the 100-yard test, and is a further proof of the steady shooting of the rifle in both tests with express bullet, so far as the 50-yard screen is concerned.

Taking the Whitney-Kennedy .50-caliber solid ball and computing the 100-yard curve from the 200-yard test, we get an average of 2.004 for the 50-yard screen, and so on with any rifle.

Incidental to the test of rifles it will be seen that we have made it a test of cartridges as well. In turning out the powder from the shell after the bullet had been carefully drawn, a note was made of the condition of the charge, if the powder grains were bright and unbroken and seemingly in first-class condition, it is entered as fine, while below this other grades of good and fair are entered. In this the same classification has been followed as that employed by the U. S. officer in making inspections of cartridges sent out for the use of the arms or for experimental purposes. How close the tested cartridges come up to the labels our report in each instance shows. We think that upon the whole the factory makers of cartridges have reason to be congratulated upon the great accuracy with which, assisted by fine machinery and great care in all stages, they have been enabled to turn out in such large quantity, fixed ammunition at such cheap rates. We have noted at various points the powder used by the various companies. The U. M. C. Co. employed the FG brand from either the Laflin & Rand or Dupont works; the Remingtons draw their supplies from the Hazard mills, while the "Rifle Cartridge Powder" of the American Powder Mills product is used by the Winchester Co. One part tin to twenty of lead is the general proportion, the bullet in a few cases being of pure lead. This last condition was true in the case of the three rim-fire cartridges from the Bridgeport factory and in the Bullard solid .50-115-346 and in the Winchester .40-60-210 from the same works.

The weather observations taken during the tests were intended to cover everything which in any way might tend to have an influence upon the rifle during the test. Generally the conditions were very favorable to the weapon. The wind ran through the Signal Service scale from light wind through gentle and fresh up to brisk. In direction, of course, being at Creedmoor every point of the compass or dial i-

represented in the table of wind quarters. The barometric readings are, of course, familiar to all, and the object in having observations taken with both wet and dry-bulb thermometers was to determine the dew point and then the humidity of the atmosphere. The dew point is that at which the density of the vapor in the air becomes equal to the maximum density corresponding to the temperature. This temperature is called the dew point of the given mass, and any further reduction of temperature will be accompanied by the condensation of a portion of the vapor which will take the form of dew, rain, snow, or hoar frost, according to circumstances. The humidity is that condition of the air, as regards moisture, which gives the ratio of the amount of vapor present in the air to the amount which would saturate the air at the actual temperature. It is upon this that our sensations of dryness or moisture chiefly depend. It is sometimes called relative humidity, and it is usually expressed in a percentage. For instance if the weight of vapor present is seven-tenths of that required for saturation, the humidity is said to be 70 per cent. It will be seen that this has an important bearing upon the condition of the interior of the rifle barrel, especially when, as in these tests, the firing was done with a dirty barrel likely to be clogged by caking powder scum. All the calculations in connection with the meteorological conditions surrounding the test were made by an officer connected with the U. S. Signal Service, and may be relied upon.

We wish in closing to again call attention to the fact that we were in no wise making a trial of the accuracy of the rifles kindly placed in our care. Had we been inclined to make any such, which we were not, an entirely different plan of operations would have been adopted. Hence it is that there are no targets published. It would have been not only unfair and misleading to make such exhibits, but they would have needlessly encumbered the record. Each rifle is undergoing a continuous test for accuracy. Our rifle scores, published from week to week of what is going on upon scores of ranges, are simply returns of accuracy tests, of course with a test of personal marksmanship attached, and without this latter we know of no satisfactory machine for making such a test. Nothing has yet been devised which can take the place of the human rifle holder. There is a nice poise and counterpoise in a rifle held to the shoulder, firmness and steadiness before the discharge, give and balance after recoil sets in, which it is impossible to simulate by any combination of swinging frames and slides and springs. All this is essential when an accuracy test is carried on, and these each marksman must conduct personally for his own information if he would get any knowledge of value to himself.

The tables which we present bring the list of trajectory heights into convenient form for immediate comparison, and many other facts are there set forth in a shape for ready reference.

In concluding, we tender our thanks again to the several rifle companies who have so kindly sent arms for the trial, and in some cases, we regret to say, got them back rather the worse for wear; to Gall & Lembke, opticians, of Union square, for the several instruments by which the scientific observations of the weather were taken; to the Fairbanks Scale Company, for a pair of balances by which the weights of the rifle, complete, were taken as tested. The officers of the National Rifle Association placed a portion of the Creedmoor range at our disposal, and we were thus enabled to carry on our trial, which is of world-wide importance in many respects, upon a range which has been in the past the scene of many international contests.

OUR GRIZZLY CUBS.

Editor Forest and Stream:

Noticing an invitation extended by you to your friends to advise you as to the disposition of your bears, and trusting I have the honor to be numbered among your friends, I beg to suggest that you send them to me. I would confine them in a natural rock-walled basin of several acres in extent, from which it would be impossible for them to escape. When they are old enough to appreciate such favors, I will engage to feed them a man a month, or oftener. We have some deerhounders here whose occupation is gone. They would gladly be fed to respectable bears, and are good for nothing else, hardly for that, for they have grown wretchedly lean since the law took effect. When the bears have grown old enough and savage enough to be worthy foes, we will turn them out with Mr. Roosevelt and his critics, and let the best man or bear win. To give the bears a perfectly fair chance, I will agree to keep out of the fight myself. Hoping that this suggestion may open a way to you of relieving yourself of the care of such troublesome pets, I have the honor to be very truthfully yours, JOSEPH VERITY, Maj. U.S.H.M.

ADIRONDA, Jan. 4, 1886.

Editor Forest and Stream:

If the grizzlies crossed with Holsteins would produce good milkers, they could be used to advantage in the war between the farmers and the milk exchange. If otherwise, hold another trajectory test at once, and without regard to barometer, thermometer, dew point or wind, try a Winchester on them over a three-yard range. WAWAYANDA.

A BEAR SCORE.—Cheboygan, Mich., Dec. 28.—Your article in last issue on the bear question has almost persuaded me to try my hand at it. I now have thirty-four bears to my credit, all within the last four years.—COOPER.

DEER IN THE ADIRONDACKS.

Editor Forest and Stream:

I was glad to learn by your correspondent "Musset" of the working of the hounding law in some parts of the Adirondacks. Perhaps my own observations will be of interest to you. I have recently returned from a five months' stay in Essex county. When I arrived there in June, as it was known that I had advocated the law, I was attacked on all sides by the owners of dogs. Their ideas on the subject were amusing at times and often exasperating. They seemed to think that the law was framed especially to deprive them of their rights and said that hounding could not be stopped, and if it was they would crust-hunt every deer in the woods; that if any one should dare send detectives into the woods, they (the detectives) would be shot on sight, and it was not long after that the story was reported, with every detail, of the shooting of the game constable from Malone for having killed a dog near the Saranac. A few weeks later we were told of the detection of his murderer.

At the Saranac much the same story went the rounds, but was located in the Raquette country. But through the summer the dogs were kept tied up much more than usual, and until late in the fall no hunting was done. Then one or two small parties sent the dogs into the woods before daylight and later in the day started out still-hunting.

Late in the season hounding was practiced more openly. But the slight observance of the law that there has been, showed how much good will be accomplished if it is strictly enforced. The deer were much tamer this fall than usual and fed nearer the clearings. And the men who took advantage of the early snow, and went out still-hunting, were very successful.

I think there will be a strong effort to have the bill repealed this winter. The dog men urge, and I think justly, that floating is doing quite as much harm as the hounds. I think the law should be amended to stop night-hunting, and perhaps restrict all deer hunting to two or three months of the year.

I think there is no question but that jack-hunting is doing great harm, from the fact that many deer are wounded, and get off to die in the woods, and many does are killed, leaving fawns, that either die, or suffer so much for the proper nourishment, that they are never of much account. The law against hounding or jack-hunting will never be properly enforced until detectives are sent into the woods to make complaint against the violators of it, for the inhabitants do not like to get their neighbors into trouble. And if we have societies for the protection of game, that are in earnest, they should see that the law is enforced.

R. M. SHURTLEFF.

NEW YORK, Dec. 24.

Editor Forest and Stream:

Yours of the 11th just received. In answer I can say that the law was strenuously lived up to in and around the Fulton Chain, with a few exceptions around Raquette Lake. Still, I regret to say, the deer have received a severer blow than usual, and if the slaughter of 1885 was to continue for ten years it would annihilate them. Fully two-thirds of the deer killed this season were killed in November and shipped to market. Of course it is much greater on account of the Pennsylvania prohibitory law, which sends many of their professional pot-hunters to this region, some of whom kill twenty and thirty per man and some even more. Now, the only way to prevent this and preserve the deer is to shorten our season to Oct. 15, as the warm weather previous to that date would be sufficient protection against any more being killed than would be consumed on the spot. Of course the pot-hunters and those who buy and sell venison would "kick;" still, I go for the greater good to the greater number, and above all to make the deer in the Adirondacks a perpetual supply. It is a mistake that the guides are killing off the deer for market, as a canvass would show that at least two-thirds of them would favor a short season from Aug. 1 to Oct. 15, with no other clause than a fine for killing or having a doe or fawn for the next three years at least, and better to make it five. E. L. SHEPPARD.

BOONEVILLE, Dec. 24.

AN OFFICIAL SLAUGHTER.

Editor Forest and Stream:

Seated under a gracefully curving pair of elk antlers, a trophy of a fall hunt in the mountains of Wyoming, with a pair of twelve-pointed antlers of a mule deer—commonly called blacktail—trophy of the same hunt, suspended on the wall to the right, and one of eight points on the left, and a pair of horned owls looking grimly down from their rustic perches in front, while a forty mile blizzard from the west is sending the snow whirling in millions of frozen pellets pounding against the window panes without, the writer proposes to tell, in brief, the FOREST AND STREAM something about a law-breaking, game-murdering hunt indulged in not long ago by a sleek, lusty old gentleman (!) not unknown to fame as a hunter, pioneer, author and an officer of prominence in the army in the late war, but whose name for shame shall not be told. He was accompanied by several friends, a detachment of U. S. soldiers, about a dozen citizen teamsters and packers in Government employ, and three guides employed and paid by himself, so it is said. For transportation, he had several Government teams and a pack train of mules, and was further supplied at public expense with tents and other camp equipage.

It is not necessary to trace in words the trail made by this hero in going to his hunting grounds; it is sufficient to say it was well marked with a varied assortment of empty bottles, cans, boxes, etc., showing that "victuals varied well in taste and other junkets," were liberally used. I will pass quickly over the trail from Rock Creek station, U. P. Railway, thence across the Medicine Bow Plains in a northwest direction to his camp in the Caspar Mountains, located at a point about sixty miles west and a little south of the now rapidly vanishing military landmark known as Fort Fetterman. The camp was in a little valley, surrounded by mountains extending miles in all directions, whose summits and rugged slopes are crowned and adorned with hundreds of beautiful park-like openings, forests and evergreens and patches of the *Populus tremula*. Here, in season and out of season, for days and weeks, this poacher and his unchristian crowd radiated from the camp in all directions, killing elk by the score, deer and antelope by dozens, and, in nearly all cases, leaving the flesh to rot where the murdered animals fell and died to pollute with its decaying taint the crisp mountain air as a reminder of their unsportsmanlike and unholy work, and the bones to bleach in everlasting monumental piles in memory of the outrages they thus perpetrated. Over sixty elk, and about seventy-five deer and antelope were killed by this doughty hero and his followers. Some of the elk were killed for their antlers, some for their tusks, but most of them, as well as nearly all of the deer and antelope, were shot down in a spirit of unadulterated cussedness, pure and simple. I leave comments to abler and more worthy hands, adding here the hope that some one will hold this gentleman up to the public gaze and contempt for the unparalleled meanness he displayed in thus wantonly killing and murdering more than one hundred elk, deer and antelope. Who will rise to the occasion? Where is Captain "Nessmuk"? A. P.

DEER NOTES.

Editor Forest and Stream:

It was about one week since one Lua Leopold was out hunting deer (out of season) when he saw something move which he shot and killed. That something proved to be a man who was at work for his bread. I am told this same Leopold shot an ox not long since in the same way. I think he should be punished the same as though he killed the man willfully, as he was engaged in an unlawful act at the time (aside from shooting the man).

I see that "California" says deer range from 100 to 350 pounds in the Upper Peninsula, and that he bagged a deer that weighed 200 pounds. I will foot it twenty-five miles to see one that turns honest scales at 350 pounds. The doe he killed was sixty pounds heavier than I ever saw, *i. e.*, with insides taken out. Your correspondent falls into an error when he gives the name of the river as Manistique where it enters into Lake Michigan. The name of the river is Monistique. The town at the mouth (through a mistake at Lansing) is Manistique. It is only an a or o. BLANK.

ESCANABA, Mich., Dec. 25.

TURKEY HUNTING IN VIRGINIA.

WEARIED with the cares of the work day world, I gladly accepted the invitation of the Judicial Mind (of whose prowess anent the red drum at Anglesea, N. J., I have, hitherto, enlightened your readers) for a few days' shooting down in Old Virginia. We took the ordinary chances for discomfort in bowling over bad roads, where the trains seem to emulate the Georgia conductor's definition of a tri-weekly train, when he said, "We try half the week to reach Squedunk, and the other half of the week we try to get back again." Our point of departure was a station on one of Mahone's many railroads, where the Virginia localities, contending for the name of the railway station, some "mute inglorious Milton" cut short the Gordian knot by calling the stopping place for the steam horse Disputanta, and so the station is called even unto this day. I could take a page in FOREST AND STREAM to do justice to the generous, wholesouled hospitality of our Virginia friends, whose latch strings, figuratively speaking, hung on the outer wall. The country for miles around Disputanta resembles the pine woods between May's Landing and Millville, New Jersey. The farmhouses are a mile apart, and the deer frequently invade the farmers' turnip patches, and with wild turkeys frequent in the cypress swamps whence the cunning hunter calls the wily turkey with a call made out of a three-inch piece of dogwood in which is inserted a piece of turkey wing.

My friend, Tobe Hodge, of whose sketches of hunting and fishing in West Virginia the literary world will say, with Father Paul, *esto perpetua*, wisely and truthfully hits off the sportsman's rabies in his "Fishing in Elk River." He says:

"When a man once has absorbed into his system a love for fishing or hunting, he is under the influence of an invisible power, greater than that of vaccine matter or the virus of rabies. The sporting fever is the veritable malady of St. Vitus, holding its victim forever on the go, as game seasons come, and so long as back and legs, eye and ear can wrestle with Time's infirmities. * * * The gold seeker stakes his claim, the wild-catting oil borer boards up his lot, the inventor patents his invention, and the author copyrights his brainfruit, but the sportsman crazily tells all he knows. That's us." Then! I never knew before what impulsive power it was which caused me to shake with the spirit of *cacoethes scribendi* as soon as I caught a big fish or bagged a score of squirrels.

This is not a paper on deer or squirrels else I would tell you how six deer were killed in two days, while the rabbits and long-tailed rodents were too thick for a Virginia hunter to waste his ammunition on. Judge Miller, almost born at old Cape May, with a rod and reel in one hand and a shotgun in the other, had come to old Virginia for two weeks' sport.

He was anxious to begin with the wild turkey, and Crafford, one of the best shots in all the country round, assured him that about nine miles from Disputanta was a cypress swamp where the turkey "yelped" in comparative seclusion, almost unmolested by the busy farmers in that locality. So, on a bright November morning the Judicial Mind gathered his traps (duffle "Nessmuk" calls it) and, with Crafford, jolted over the bad roads till they struck the latitude of the cypress swamp. The turkey hunter of Virginia believes in a good setter dog as the proper accompaniment to every successful turkey shoot, and no sooner had we hitched our team than we let the "courser" loose. He soon had a flock of turkeys on the wing. The Judicial Mind looked sadly as they flew into the swamp swift as greased lightning, and said, "That cooks our goose."

"You just wait," replied Crafford confidently, "and you'll soon be a hearin' something."

Nobody knew better than this "Old Virginia Never-tire" hunter of thirty years' practice that there is nothing a wild turkey is so likely to do as to come out at the same hole he goes in at; *i. e*, if you scare up a flock of turkeys, build your blind and call in your dog, and then skillfully sound your turkey call, and ten to one you will bag two or three in less than an hour. Well, I was only a looker-on in Vienna, and I had the laudable curiosity to see how the Judicial Mind would work on the turkey call. I had heard him call the "list" in court, with judicial severity.

The blind was hastily put up by piling up logs about three feet high and covering these with brush, then Crafford gave them three or four calls. No answer. We lighted our sweet-briar pipes and talked deer fifteen minutes, while the gray squirrel was nimbly skipping above us, with a semi-occasional and rasping bark, as if to proclaim his proprietary rights in that ante-bellum forest. But when one goes for turkey, rabbits and squirrels don't count.

The Judicial Mind had exchanged his pipe for a ten-cent Havana, when Crafford gave another yelp or call, which was answered by a rousing big gobbler apparently half a mile away in the bowels of the swamp.

"Get ready, quick!" whispered Crafford; "don't you yer him?"

One more soft call, as if the amorous hen turkey sighed, like Cleopatra, for her lord (and gobbler of the forest) Antony, and the big gobbler himself came running toward our improvised blind as a Philadelphia lawyer would run with the devil after him.

"Now," softly said the old sportsman, "no time to lose!"

There stood a magnificent he-turkey, with neck glistening in the sun like the sheen of the minarets of an Oriental temple (metaphors come free in the woods). As to the judicial Miller, as the darkies say, "What make his eyes shine so?" He looked as glad with excitement as the robber chieftain Hernani when he scooped his Donna Zanthe from the arms of the fiery Don Carlos, in Hugo's drama.

But swifter than I am telling all this to the FOREST AND STREAM Judge Miller had drawn a bead on the gobbler and he bit the dust *eo instanti*, head and neck riddled with double BBs, for he was not twenty steps away from the blind. Swift as the wind the setter sprang over the log barrier and had the turkey by the neck.

It was the work of a moment to drag our trophy inside of the blind and prepare for offensive action against the rest of the flock. This time it was a hen-turkey which, wearying of solitude, answered Crafford's seductive call, only to be bowled over ten steps off.

This satisfied us for the day, and, with dog and guns, we were soon jogging along behind a pair of mules toward Disputanta, where, as the "looming bastions fringed with fire" slowly followed to rest the sinking sun in the pillared firmament, we sat down at Crafford's table, and if it did not groan, we did from too much fat venison, fried chicken, Virginia hoe cake and stewed rabbit, cooked with the delicacy which distinguishes Delmonico's French cooks. I may tell yon more about this paradise for hunters. J. M. S.

THOSE CITY FELLOWS.

Mr Editor

Some gentlemen have been to home with our folks and they left your paper and as I see such a lot of letters about shootin I calculated I would right your paper one as how we have such a right smart lot of game hereabouts but not so plenty as used to be I reckon for pap says that there was a time when a heap of deer could be killed hereabouts I reckon them must been mighty good times besides these for we dont find nothing with four legs bigger then a fox and mighty scerce they be to, but we get right smart of rabbits and possom, but we dont hunt rabbits the way the city fellows do becanse we cant get many that way, they had nice dogs but they did not do much good because they wouldent run after them, they would only stand and look at them when they would jump up the same as they would when phesents and partriges would be near them, I never took a liken to a dog that wouldent go after rabbits, but the gentlemen said that was the way for them kind of dogs to hunt and they said as how we ortento hunt with feritts but if we dident we wouldent get much more than the city fellows with there new kind of guns as paps gun is a mighty good gun but only shoots one bulit, and when we told them as how we always went after birds without a dog they dident think we could get so many but you see they dident know we took paps gun, and they take there dogs and always have to shoot when the birds fly, but we have a better way than that we always slip up to them and shoot them before they fly away but we never get more than one at a time with paps gun and I guess them fellows when they went home wished theyd taken our pattern for I herd one say to tother that fine dogs and guns and fixins wouldent get right smart of game, but I always like the fellows that comes from the city as they be mighty clever and by all the rabbits and birds our boys shoot and give us right smart for them to, and we always like to show these fellows were to find the rabbits and birds but somehow rother they don't get many and so we sell them ours, but city men be not all alike for last year there come a little fellow with a kind of fancy cloths and sort of red face with red hair on the sides and with 2 dogs same coler and when I asked him if he wanted me to show him were the game was he said he guessed not and he went by his self and come back to home with such a lot of birds as I says to myself he must have had as good a gun as paps, anyhow I kinder thought he wasent a regular city fellow and asked him bout it and he said he used to be a gamekeeper for lord somebody in England, anyhow I dont want to see any more little fellows bout here with face and hair and wiskers and dogs all alike, I wish all the gentlemen as comes this way would bring your paper with them Yours truly HEZEKIAH WILSON.

BUTLER COUNTY, Pa.

PHILADELPHIA NOTES.

IT is told by Ed Lynch, who shoots for the Maxwell's Point Ducking Club, that on one occasion, having two New York gentlemen with him and succeeding in taking in a large flock of canvasbacks and redheads, the result of the combined fire of the three guns made such slaughter and so much blood was visible on the water after the discharge that one of the sportsmen could not stand the sight of it and fainted dead away and did not recover for fifteen minutes. Much is learned in talking with such men as Lynch and McComar. Lynch tells me "never undertake to crawl on a flock of ducks when the wind is off shore; it is no use and can't be done." Both McComar and Lynch state that duck-shooting from points where artificial points have been built out is not so good as that from points where only the natural extension into the water is relied upon. Tub shooting is doing as much damage as the battery shooting. The Delaware still seems favored with both mallard and black ducks, and not a day passes but reports come from below that they are plentiful.

The snow in the interior parts of the State has entirely disappeared, and at no time since winter set in has there been a damaging crust. Very few quail have been killed in our State this winter, and it is hoped the season may continue open to aid their increase.

Rabbits have been unusually plentiful in Pennsylvania this year, and more black bears have been killed in Pike and Sullivan counties than at any time for many years.

On Dec. 29 one of the largest fox-chases, as to number of horsemen and dogs, took place at Lionville, in Uwchland township of Chester county, the occasion being what is called a bog hunt. The fox was dropped at 2 o'clock, and a few minutes later over two hundred hounds and over one hundred horsemen set out in vigorous pursuit. Among the riders were two old hunters from Charlestown, John Kugler and Charles Fetters, aged respectively eighty and eighty-

two years, and none entered into the spirit of the occasion with greater zest than they. The other hunters represented Lionville and vicinity, West Chester, Pottstown, Malvern, Wagontown, Sadsburyville Gap, Glen Moore, Churchtown and portions of Delaware county. The fox proved a wary and lively one and kept up the chase until evening, when he took to the rocks and escaped. HOMO.

HUNTING TROPHIES FOR THE AMERICAN EXHIBITION.—Knighton, Buckhurst Hill, England.—*Editor Forest and Stream:* As you are no doubt aware there is to be an American exhibition on an extensive scale in London. I have suggested to the directors that it would be a favorable opportunity to get together a collection of American hunting trophies. The idea has been very warmly received by them and by many sportsmen in this country. There is the nucleus of a very fine collection of heads of wapiti, sheep, moose, etc., which are in the possession of sportsmen on this side of the Atlantic, but I am sure that there are many on your side, as well as professional naturalists, who would be glad to contribute the loan of fine specimens. It is proposed to extend the exhibition to the fur-bearing animals and game birds. If you would publish a brief editorial on the subject it would no doubt bring us many valuable and interesting exhibits. Mr. Whitley, of Poultry, London, is the director general of the exhibition. Mr. Pendarnis Vivian, M. P., Mr. Moreton Frewen and others have associated themselves with me as a committee for the purpose of making the collection.—E. N. BUXTON.—[Communications respecting the exhibition may be addressed to J. G. Speed, 32 Nassau street, N. Y.]

VIRGINIA SHEEP, DOGS, WILD CATS AND PARTRIDGES.—Nearly all the lazy, shiftless, cranky old farmers, reinforced sometimes by a shrewd nutmeg Yankee, often relieve their pent-up feelings by shooting off their chin at the worthless curs that yearly destroy 40,000,000 of sheep. Yet in eastern Virginia good stock sheep are selling at 85 cents a head by public auction. Does that look as if the demand was in excess of the supply? A dog's hide will fetch 85 cents at the tan yard. The truth is many of our best farmers are ardent fox hunters; but they are men of industry, and look after and take care of their sheep. Then again there are farmers along the foothills of the Blue Ridge, who think it is very smart to poison dogs with strychnine, and for their pains, since the dogs have gone out the wild cats have come in, and made it very bilious for the poor little lambs. And but for the foxhunters, the red foxes would be masters of the situation all over Virginia and kill nearly every lamb that is dropped. In a few years it may be said of the Virginia partridge, all north of the James River, "Ilium fuit."—KILLBUCK (Jan. 1, 1886).

MISSISSIPPI.—Aberdeen, Jan. 5, 1886.—On Monday last the Aberdeen Gun Club had their annual side hunt. The club was divided into four teams of four and hunted one day. Their score footed up 351 quail, 33 hares, and 3 squirrels. Two members of one of the teams failed to hunt, so the above represents the score of 14 guns. With a friend who like myself does not approve of wholesale destruction of game, I took an outing on Monday and Tuesday, spending Monday night with a friend at his prairie plantation. While our bag for the two days was not a phenomenal one, numbering only sixty-eight quail and three hares, we had enough for ourselves and some to spare for our non-shooting friends, and can return to our wonted occupations refreshed and without the burden of game butcher on our consciences. The best wishes for a happy and prosperous New Year to the FOREST AND STREAM and its numerous readers.—WILL.

LIGHT RIFLE LOAD FOR SMALL GAME.—*Editor Forest and Stream:* Having a .40-60 Winchester rifle and the regular cartridges being loaded heavier than necessary for squirrel and other small game, I filled ¾in. of my shells with lead, having placed a pointed stick up through the primer seat so as to leave a small hole through the lead. I load with 30 grains of powder and a round ball of my own casting, using a lubricant composed of four parts beef tallow and one part beeswax. With a shell loaded in this manner very accurate shooting may be had up to 150 yards, while the cost is less than half that of the regular .40-60 cartridge. Of course the gun must be used as a single loader when using this shell, as it will not work through the magazine.—EN AMI (Macomb, Ill.).

ARKANSAS.—Kerr Station, Lonoke County, Jan. 1.—We are having lots of fun squirrel and quail shooting. Both are very plentiful here. Ducks and geese are very scarce on account of the open winter. Fairest weather up till now for years. Deer are scarce. I and my partner, Bud, killed 35 squirrels yesterday, he using a Ballard .22 caliber and I using my Winchester .22 caliber, 25 shot. That is my favorite squirrel gun, with a Lyman rear sight and almost any good front sight. I also have a Sharps .45 caliber, with Freund's more light sights on it, which style of sights I greatly prefer to many patent sights.—G. H. C.

QUAIL SHOOTING.—All who are intending to take a shooting trip south will do well to read the advertisement headed "quail shooting" in another column. In addition to an abundance of quail, there are some wild turkeys, a fair amount of gray squirrels, and plenty of cotton-tails. The climate is healthy and the weather is fine with no snow so far this season. The best quail shooting is from the middle of the present month until the close of the season.

CERTIFICATES OF CLUB MEMBERSHIP.—In another column Mr. W. C. Hinman calls attention to his illuminated certificates of club membership. We should think that at the low prices at which these are offered there would be a good demand for them, as most club members would be glad to have some visible token of membership in their organization.

THE old and popular firm of J. Stevens & Co., of Chicopee Falls, Mass., manufacturers of the celebrated Stevens Fire Arms and Fine Machinists' Tools, have sold out their business to the new corporation just formed under the name of the J. Stevens Arms and Tool Co., with the following officers: Joshua Stevens, President; William B. Fay, Joshua Stevens, George S. Taylor, Directors; Irving H. Page, Secretary; James E. Taylor, Agent and Treasurer. The above took possession of the business January 1, 1886.—*Adv.*

S. W. FREUND, Esq.—Dear Sir: The set of sights received from you not long ago are all that you claim for them, and I think the best of open sights. Respectfully, ALEX. T. LOYD & Co.—*Adv.*

FORT BOWIE, Arizona, Dec. 14, 1885.—*F. W. Freund.*—Dear Sir: I consider your sights the finest made, and am well pleased with mine. They are perfection in every respect. Yours respectfully, JAMES C. HANCOCK.—*Adv.*

Sea and River Fishing.

SALMON AND TROUT FISHING.

THE STATE OF THE ART IN ENGLAND.

WE have before us two books on fishing recently published in England, each of some 450 post octavo pages. One is devoted to salmon and trout fishing; the other treats of angling for "Pike and other Coarse Fish."

These books form part of the "Badminton Library," a collection designed to consist of a number of volumes, which, taken as a whole, will form an encyclopædia to which the inexperienced Briton may resort for such information as he may desire in reference to any branch of out-of-door sport.

It is our purpose at present to consider the volume on salmon and trout fishing only. Of this Mr. H. Cholmondely Pennell appears as the editor, and in part as the author. A happier selection of an editor would have been difficult. Mr. Pennell has not only the power of expressing his ideas in an unusual degree, but he is also even more unusually fertile in ideas to express. Few, if any, have written more real common sense in reference to angling than he. His personal equation leads him to the practical side of angling, and he habitually examines each point he discusses solely upon what seems to him its intrinsic merits, altogether uninfluenced by prejudice, and very little by tradition.

But let us proceed to the book.

It opens with 109 pages on "Tackle and Fishing Gear" written by Mr. Pennell himself.

Perhaps no part of the book will interest the American fly-fisherman more than this. However doubtful he may be as to the value here of directions intended for the use of anglers upon the other side of the Atlantic, he recognizes the fact that the birth-place of his art was there, and that at all events the appliances there in use are the same in kind as those he employs. Which are the better of their kind, theirs or ours, is a question of unfailing interest—a question which an examination of the pages under consideration will go far to answer.

Mr. Pennell first discusses the subject of fish-hooks. Here he speaks with the voice of authority; and, as far as the American reader is concerned, to those sadly in need of the information he gives. The Sproat hook may be safely assumed to have ranked as the best attainable in our esteem for many years. But that form of hook which made the reputation of the Sproat appears to be a thing of the past. Each manufacturer now makes his own distinctive pattern of Sproat, differing not only from those of every other manufacturer, but from the original form as well. Indeed it would be hardly too much to say that in the goods now sent to this market under that name, they retain every defect, and lose sight of every merit which gave to the original form its enviable reputation.

Actuated possibly by some such considerations as these, and guided by his sound knowledge of the laws of mechanics, Mr. Pennell designed a hook some years ago which he regarded as an advance in the art. He took the Sneck bend—that square-bent hook, with the point curbed or turned to one side—obliterated the curb; inclined the point inward toward the shank after the manner of the Sproat; provided it with a long conical point that it might penetrate easily, and at the same time render a good barb possible without making it "hollow" and without excessive cutting into the wire; made it deep on the barb side that the fish might play at a distance from the point of escape; and reinforced the weak point of the Sneck—the almost rectangular bend at the bottom of the shank—by thickening the metal at that part. This hook for some reason never seemed to make itself felt in this market. Notwithstanding, it was theoretically nearly a perfect hook; and, after three seasons of severe trial in actual fishing, we feel assured that its practical are in no degree inferior to its theoretical merits. Indeed we consider it altogether the best hook we have ever used. But Mr. Pennell was not satisfied with this. Clearly the more or less rectangular bend on the shank side of the hook weighed on his mind as an element of weakness. He has recently designed what he calls his improved "Limerick" hook. While to the casual observer it does seem closely to resemble the ordinary "Limerick," still the critical eye will at once recognize that it is really his old form, embodying all the features upon which its excellence depended, and only resembling the hook which gives it name in that the shank is united to the barb side by a long and easy curve. This increases the strength at that point, and for that reason, we suppose, Mr. Pennell recommends its use where large hooks are required, in preference to his Sneck form.

But this is by no means all of value in reference to hooks in these pages. We are in the habit of providing our flies either with a length of gut terminating in a loop, or with a small loop of the same material located next to the head of the fly. Our leaders also terminate in a loop, and the fly is attached by uniting the loop of the fly to that of the leader.

It would seem that we are in this practice a trifle behind the times.

No one will question that inconveniences attend the use of the long gut appendage to the fly. If a strand of the full length is employed, it must be carried in a coil and straightened before use, while the removal of one fly from the book usually drags a small swarm of other flies in its wake. On the other hand if the gut is made sufficiently short to be carried stretched to its full length in the fly-book, as is now the custom, we disregard one of the cardinal rules of the art of war against timid fishes. We place near what is designed to attract, something well calculated to alarm and repel. Only he who has actually tried the experiment will fully realize how conspicuous these two united loops really are, imprisoning as they almost always do each its own film of air, which glitters like polished silver when submerged.

If we use a short gut loop at the head of the fly instead, (as in salmon flies) after the fly has once been wet the gut loop is apt to twist on itself. Thereafter the fly no longer swims upon an even keel, but wobbles through the water in a manner equally demoralizing to the fish and the angler.

A letter received from one of the highest authorities on fly-fishing in the United Kingdom assures us that the better class of fly-fishermen throughout Great Britain have abandoned the use of all gut appendages to the fly, the imitation insect being built upon a naked hook the shank end of which terminates in a small eye, into which the end of the leader—or casting line, as our English brethren seem to prefer to term it—is tied. Might we not imitate them in this to advantage.

It is quite true, as Mr. Pennell frankly states, that the eyed hook is old, and that it had been tried and found wanting. It is but another example of how slight a change of structure will often convert a mechanical failure into a brilliant success. The change in this instance consisted in giving the eye a bend upward of something more than half a right angle. The leader then, if the knot is properly tied, leads from the hook in a continuation of the line of the shank, causing the fly to swim perfectly upright and on an even keel, while the useful life of fly the depends on the cohesion of the material of which it is composed, rather than on the integrity of the gut upon which it is tied. Some authorities claim that a fly so constructed lasts five times as long as one made in the manner usual here; but however this may be, there can be no question that it will last much longer, be less likely to snap off on the back cast, swim straighter, and that the connections between the fly and the outside world is much more closely disguised.

Mr. Pennell has improved on this form of hook by turning the eye downward instead of upward, thus, as he claims, improving the draft-line of the hook, and causing the leader to lead straighter from the fly with a consequent improvement in its swim. These claims seem to us well founded. In the pages under consideration he figures both forms of hooks, and gives full, explicit, and easily comprehended directions as to what knots should be used, and how they may be readily and infallibly tied.

We have dwelt at length on this matter, since it seems to us a decided advance in the art, and one well worthy of the careful attention of American anglers.

But if we are somewhat behindhand in the matter of hooks, it would certainly appear from the pages under review that in the matter of rods "the boot is on the other leg;" and that they, our English brethren, are really quite benighted in this respect.

Mr. Pennell has too sound a knowledge of mechanics to lose sight of the advantages which a short rod offers over an unnecessarily long one. He uses a rod of ten feet seven inches in length, but though it weighs no less than ten ounces he calls it a light rod. We should call a rod of this length light only if it did not exceed six ounces; whereas if it weighed eight or eight and a half ounces we should call it a fairly heavy rod, and quite adequate for any use to which a single-handed fly-rod can be put. Indeed we have known in a number of instances of salmon of fifteen pounds and over being taken with such a rod.

Mr. Pennell speaks of fly-rods for ladies' use as follows "Eight feet and a half, or so, is ample for a ladies' single-handed fly rod, and such a rod need not exceed eight ounces in weight." Every American angler will agree with Mr. Pennell as to this length, but as to the weight we should consider four, or at most five ounces, quite sufficient for all purposes.

However, the weight of a fly-rod and its length are a good deal a matter of taste, a taste with the free exercise of which we are by no means disposed to quarrel. But when we come to the means by which the lengths of a fly-rod are joined together it is quite another matter. We are then dealing with a question of pure mechanics. Mr. Pennell figures screws, bayonet-catches, and other devices for locking the ferrules of fly-rods together to prevent them from throwing apart. Now it would be safe to assume that, with our fifty-five millions of people, full as many ferruled fishing rods are in use in this country as in Great Britain—nay, if we remember that practically nothing but ferrules are here used for this purpose, it seems probable that we have considerably the greater number. How is it then that on one side of the Atlantic some device for preventing the ferrules of a rod from throwing apart is deemed absolutely necessary, while on the other side such a device is thought absolutely useless.

We believe we can suggest a reason. It would seem that in England the notion prevails that ferrules must be "hammer-hardened" to give them the requisite stiffness. It does give them this stiffness, but at the same time it renders a proper fit almost impossible, certainly impossible unless the inside of the outer ferrule be refinished in some way other than by grinding after the hammering. The same stiffness can be obtained by drawing the tubing "inside and out"—that is between a mandrel and a die—while a ferrule so made is smooth within and cylindrical in bore. The entering ferrule can then be readily so fitted that the joints will never throw apart—at least they never throw apart in America unless badly fitted, or unless the rod is carelessly joined and without inserting the entering ferrule to its seat.

Another thing will amuse the American angler in this, as well as in almost every other English work on fly-fishing. He will find the very same arguments in vogue against split-bamboo rods that were current here some fifteen years or so ago. The split-bamboo has with us so lived down all defamation, that no one any longer questions its superiority. Analogy would lead us to believe that the same result will follow in time in Great Britain.

We have dwelt so long on the first part of this book that lack of space, rather than inclination, will compel us to do the rest but scanty justice.

Mr. Pennell follows his chapter on "Tackle and Fishing Gear" with 67 pages on the "Natural History of British Salmonidæ," in which he distinguishes between what is known and what is surmised with his usual discrimination.

Next follows a very valuable paper on Salmon Fishing by Major John P. Traherne, a gentleman whose name and fame as a brother of the angle is by no means restricted to the Sea-Girt Isle. This paper is of a strictly practical character. The Major knows just what he wishes to say, and he says it with military directness, and in a manner which would seem to render it next to impossible for the reader to fail to grasp his meaning. Should we begin to praise all in it that merits praise, we should be obliged to consider it page by page. We will allude to but one point—the admirable illustrations of a dozen or so of the more meritorious varieties of salmon flies. Each fly is given full size and with a page to itself. Subjoined is a full description of its component parts, and a history of its origin. We regret to be obliged to dismiss this admirable paper in so summary a fashion. If we have met with its equal in the literature of salmon-angling, we certainly have never encountered its superior.

"Fly-Fishing for Trout and Grayling," by H. R. Francies, follows. It is charmingly written throughout—the introduction especially so,—and cannot fail to prove of great value to the British, and of interest to the American angler.

Other papers on methods of fishing peculiar to Great Britain are included, all seemingly excellent. Lack of space compels us to dismiss them with this mere mention.

In conclusion we feel assured that every reader of this admirable book will join us in congratulating its editor and the contributors thereto, as well as the promoters of the Badminton Libery, in having added so valuable a contribution to the literature of angling. It is published in London by Longmans, Green & Co. and in Boston by Little, Brown & Co.

HENRY P. WELLS.

NEW YORK, January 1, 1886.

A SECOND NEW YEAR TRIP.

SINCE the last issue of FOREST AND STREAM appeared containing my reminiscence of fishing in Minnesota on a New Year day long ago, an old friend dropped in on me and said: "You have either a very bad memory or you think others have, to try and work off a story like that on them, I just laughed when I read it, because I knew nothing of the kind ever happened." His proffered cigar was accepted, as they always are, and all the reply he got was a look of inquiry which was intended to ask why I was to be guyed in this manner when there was no point visible. "Yes," he continued, "I read it to my wife and explained to her how no such thing could have happened, and how I knew better." By this time my tongue unloosened and said: "Well, may I ask how you knew better? I will assure you that not only are the facts just as I stated them but the real names of the entire party were given. I never wrote a truer thing in my life." Now be it known that very often, when he wishes to be particularly impressive, he descends to the use of cant phrases, such as are common among the street arabs, and on this occasion bid me "come off the roof," adding, as he took up the paper, "the first line condemns the whole thing. Here you say: 'The first day of January, 1877, found me in what is now Aiken county, Minnesota.' Now, I happen to know that during that winter you were in the New York Aquarium, and on that particular day were in Pike county, Pa., fishing with our lamented friend Fred Jones, who was drowned some years ago on the outskirts of civilization." I saw it! The fact was that either the printer or I had made an error of twenty years. The affair occurred in 1857 when that country was indeed a wilderness, and my friend was afterward convinced that such was the case. "Well," said he, "how was it about that New Year fishing trip with Fred Jones just twenty years, to a day, after the one you related? I often asked Jones about it but he always branched off on something else. How was it any way, did you have any sport in mid-winter?"

There was no dodging him, so I settled back in the chair, cut off more from the end of the cigar to make it draw freer and gave him what he would have called the "straight tip," which was something like this: Jones often came to the Aquarium and as often said that we ought to have some of the big pike from his lake: you know he owned a tract near or adjoining the grounds of the Blooming Grove Park Association. He said we could get monsters there, and if I would only go and stay a week we would have good sport, plenty of big fish and it should not cost either the Aquarium or me a cent. Now in my younger days I had fished for pickerel through the ice, but had long ago abandoned it and did not enthuse over the promised "sport." He talked with the proprietor, Mr. Coup, until the latter urged it and late in December we went. At Hawley we loaded the sleigh with provisions and listened to the bear stories, for which that place is celebrated, as told by the old whisky-soaks, for which it is equally celebrated, who kill more bears around the stove in the groceries than are to be found in all North America. Here we were met by "the General," Jones's game keeper, a garrulous old duffer who would swear that game and fish never were as plenty before, "more deer as hever hi seed in the park of the Marquis of ——, when hi was 'is 'ed game keeper," etc. It was cold and the snow was deep and had drifted. The "General" managed to upset us once, on purpose as I thought, to repack the sleigh in order to inspect the contents of some jugs which might have contained either vinegar or molasses, or both, but Jones was equal to the emergency and made him attend to the horses while we repacked the goods. We did not upset again. The lodge was reached and the General's "missus and kids" welcomed us with stares and a warm supper. In the presence of his "missus" the "General" took a back seat and one did not need to be under the roof long to learn that the gray mare was the better horse.

The last day of the year came in with a blow, and the drifting snow forbade any fishing, so we drove over to a wagon maker's to see the sporting wagon he was building for Jones. It had racks for rods and guns, kennels for dogs, lockers for clothing, refrigerators for provisions and refrigerators for game—and I noted that these were of equal size, though I would have made the former largest—and ammunition chests and perhaps other things which I have forgotten. I thought it complete, and if called upon to suggest an addition could only have recommended a shot tower, wherein she sportsman might furnish himself with a necessary article in case he needed it and should be near a lead mine, but I thought this too valuable a hint to give away, and reserved it until it could be patented. Back at the lodge we found that the General had caught some minnows for bait and had them alive in a perforated bucket in the spring. We supped, smoked, told all the stories that we knew (chestnuts most of them), yawned and went to bed.

New Year's day was cold, some wind and a little movement of fine snow on the surface in exposed places. Although the lake was in sight of the house we took our lunches, for, as the "General" said, "If they be a-bitin' we haint a-goin' to leave um for a bit to eat." There was too much snow on the ice for skates to be useful, and we went to the further end of the lake, where the "General" said "the big ones be," and he cut holes while we baited hooks and rigged tip-ups. The wind raised a little snow-dust from the surface, as I have said, and this covered the holes and froze the tip-ups so that they would not tip up if a fish took hold. We ran round, stamped our feet, blew our fingers and cleaned out the holes. After about an hour of solid sport of this kind Jones gave a "whoop!" and pulled up a fish. It was a perch of about four ounces. We celebrated the event. Just how we celebrated it I leave you to judge. What would you have done in such a case?

My friend had no idea what would be the proper thing, and when I told him that we ate a snow ball to cool us off, he said: "Yes, I think I would have taken a ball too." He put an emphasis on "ball" that I did not clearly understand, but as I am not up in all the slang of the day these things pass without question. After this interruption the narrative was resumed.

We found that we were cold and agreed to go to windward in a cove and start a fire. On the way along shore I killed a rabbit with a revolver and the "General" dressed it and hung it up. By the time the fire was well under way the rabbit was nearly frozen, and we cut it up and roasted it in detail to add to our lunch. Then we took a ball (my friend, of course, understood this to mean a snow ball, as there was no chance for fish balls) and after a hearty lunch and a smoke we went to inspect the tip-ups, which, being frozen, would not tip. Jones attempted a pun about not getting any "tip" from them, but the day was cold and levity was not in order. The lines were cut out and yielded a pickerel of about two pounds. We looked toward the lodge and knew by the smoke that so gracefully curled, etc. (see the "Third Reader"), and without consultation we started in that direction. We had the two fish cooked for supper, and then sat down and talked fish. I don't know whether he told any untrue stories or not, if he did they were believed, and as he is dead I hope he has forgiven me for all the fishing lies I told him.

"I always regarded Fred Jones as a much more truthful man than you," said my candid friend (how can people be so confoundedly candid? Doesn't it pain them?). "For," he added, "he used to shoot as well as fish, while you know you only fish."

"Certainly," I retorted, "but when I went out with a gun I used to lie a great deal more about what I killed than I did in after years about what I caught, because when we are young we want to kill things and are sensitive on the point of our destructive ability. We have not the courage, which comes of experience, to say that we have hunted all day and brought home no game. As we grow older we are not ashamed to come home with an empty creel, for have we not the example of one of the earliest of fishermen, who said: 'We have toiled all night and caught nothing'? We come home or into camp and state the facts. The professional funny man of the daily newspaper has been trying his hand at the angler whom he has seen fit to call 'the trout liar;' but the slander, like that on the mother-in-law and the traducing of the goat, does not really injure the genial fisherman, the abused mother-in-law nor the hilarious goat.

"Well, what did Coup say when you went back to the Aquarium with nothing?"

"Jones went in to square it, and among other things told him that if we had been there a week before we would have taken some huge pike. This was a 'chestnut,' and awoke memories in Coup of the days when he was managing the 'greatest show on this or any other planet,' and he simply said, 'Mr. Jones, when I struck a town where the receipts were less than the expenditures every man in the place would tell me that if my circus had only been there a week before we would have to hire extra teams to take away the money.'"

Jones felt the worst about it, and never missed an opportunity to declare that fish of great size abounded in his lake, but that we struck it in just the wrong time. This may all be so, but as I went fishing through the ice on that occasion partly under protest, it is the last time that I ever will try it for sport. My friend who thought he had me cornered, accepted the amendment of putting the Minnesota New Year story back twenty years and buried the hatchet.

FRED MATHER.

MY FIRST TROUT.

LAST July, a year ago, I took my first trip to the trout regions of the Northwest. Our course lay by way of St. Paul over the line of the Northern Pacific Railway. After the necessary arrangement about transportation, etc., we started on our journey of some seventeen hundred miles. Our party consisted of Col. J., wife, son and three daughters, myself and daughter and two servants, all comfortably housed in a special car kindly tendered the Colonel by the railroad officials. Our first stop was made at Lake Minnetonka, where you can have all the expensive luxuries of a great watering place, with little of the element of sport. From here we went to Brainerd, Minn., and were sidetracked for a few days' bass fishing. Next day we went to Deer Wood Lake and had a splendid day with the bass. We were fortunate in securing good skiffs and rowers and soon had all the party busy landing the bass and pickerel from the clear deep waters of the lake. All did well. The young girls enjoying the sport hugely, but the Colonel proved the champion of the day. From this point we moved on west, our next halt being Ft. Keough, M. T., here we met a regular blizzard. Remained one day to refurnish our car and then moved on.

We next halted at Ft. Missoula, M. T. Here expected to capture our first trout. After a day's rest we started bright and early for the Rattlesnake, a small bold mountain torrent that empties into the Missoula River at Missoula City. The Colonel, although an invalid, was eager for the fray. We had a pleasant time but caught very few fish. We next started for the Jocko and Thompson's River. Magnificent trout streams and literally teeming with trout. Here we took all the trout we could use and felt refreshed by the pure air and mountain scenery, which, to most of our party, was something entirely new. After remaining one day in this grand but solitary region, we went back to Missoula City, stopping at short intervals, where the streams neared the railroad, and cast our flies for trout, generally with success.

We concluded, after a day or two, to explore further west. Accordingly orders were issued to hitch on to No. 1 and take her to Lake Pen D'Oreille. The journey was through extensive pine forest most of the way, and in places—it will sound incredulous to persons who have no idea of this country except through the current literature of the day—the road was literally walled on either side by the heavy timbers removed from the roadbed. We were, in respect to fishing, sadly disappointed in these lakes; but then it was worth the trip to see this beautiful sheet of water, extending for seventy-five miles and from five to ten miles across. Some as lovely pieces of scenery as mortal eye ever beheld lie nestled in this secluded natural retreat. But as for the fishing, there was no use trying. We found encamped upon this beautiful water about five or six hundred Indians, who had fished the lake for all it was worth since the ice disappeared. We were told by some one that the way most of the fish were captured was by dynamite. While walking along the beach we could see great numbers of dead fish washed ashore by the action of the waves. The Indians were preparing, so we were informed, to break camp, as they considered it unprofitable to stay, as the supply of fish was exhausted. The fish captured were all shipped to Portland and other places on the coast. We experienced the hottest weather at this place of any during our trip. The thermometer, hanging in the car with windows and doors open, showed about 110°. In fact, I thought that we would suffocate during the night.

Late in the evening we noticed some excitement down about the station house, so I went down to see what was up. I found chained to a telegraph pole a young cub bear, which had been captured by some of the railroad men that morning and over which they were having some amusement. I went back to the car, as it was about night, and had no more than got to the car when I heard the crack of a rifle and the urging on of dogs and almost at the same instant the cracking of the brush at the end of our car, when a large black bear rushed by and made for the border of the lake and soon disappeared from view behind the bank. It was supposed that this was the mother of the cub, who probably hearing the cry of distress from her captured child, thought she might rescue it from bondage. We were delighted when the express train arrived with orders to remove us back to Missoula City. Here we found pleasant air and lovely scenery and feeling that in our experience it certainly was the trout country.

After a day's rest we concluded to take a trip up the Bitterroot Valley. When our coachman arrived we found out that we were expected to have the honor of sailing up this beautiful valley in the old Villard coach. The Colonel, who was the moving spirit in all our enterprises, rather objected to any such notoriety; but after being told that there was no other wagon, other than a common road wagon, that would take a party of eight exclusive of driver, the Colonel gave in and we started for the Lo Lo. Here we had good trout fishing, and the girls enjoyed themselves gathering flowers and ferns. However, we had but a short time to stay, as we purposed going back to the car that evening. We intended resting one day and then make a tour of the National Park. That night, just before bedtime, a physician called and said that he had just learned of our presence, and insisted on a regular trout fish the next day. The Colonel, being pretty well tired out, did not care to make such a trip, so it was arranged that the Doctor and I should go back to the Lo Lo next day after he had attended to his professional business in the morning.

It was near twelve o'clock before the Doctor drove up in his gig for our trip. The Doctor insisted upon our taking the guns and his pointer, so with this outfit we were soon on the road. The Doctor's horse proved to be a good one, and by 2:30 we were on the ground. We soon arranged our tackle and started for the stream whose roar, as a great waterfall, could be heard through the great growth of timber about one hundred yards from where we hitched our horse. The Doctor is an expert fly-fisherman, and kindly selected my fly and gave me the necessary information how to manage when I got a strike, etc. We now went down to the stream and fished about one hundred yards apart, but on account of meandering channel and the high mountains and thick undergrowth, we were out of sight of each other. My first cast fastened on to a twelve-inch fish—about three-quarters of a pound. I landed him safely, and repeated the luck next cast. We fished for about an hour and the Doctor thought we had better start home. When we got to the buggy the Doctor emptied his creel and I emptied my hunting coat pockets and found that the catch footed up, for the Doctor 32, for your humble servant 30, making 62 fish all told. We started for home taking our time and eating our lunch as we went along. We got home after dark and found our friends very anxious about us as we expected to leave that night for the Park, a history of which trip I will give you in my next. OCCIDENT.

SEDALIA, MO.

THE "KINGFISHERS" AGAIN.—*Editor Forest and Stream:* I was recreating at Cheboygan in 1884, when the "Kingfisher" letters, descriptive of the Black Lake trip, appeared in FOREST AND STREAM. A Cheboygan editor deemed these letters of sufficient interest to reprint them, and I was present when Merrill first saw them. After reading the one wherein he is styled a "mossback" and furnished with an overdrawn mossback dialect, he exclaimed in anger in the presence of half a dozen persons, "I may be a mossback, but I don't hire mossbacks for $5 per deer to drive deer into Black Lake for me to kill out of season, and then abuse them behind their backs." Of course I cannot say whether Merrill spoke maliciously in his anger or had confounded the two Cincinnati parties and supposed he was delivering a righteous judgement. "Kingfisher" says: "We had no special grievance against Merrill, and were treated at least fairly by him." Such having been the case, Merrill would not look in this direction for ridicule or unfair treatment, but natually attribute the "Kingfisher" letters to the parties with whom he had had trouble. Previous to this time I had heard nothing against the "Kingfishers," but immediately afterward the subject became an open secret, especially as the writer of their annuals scourged game law violators. Mr. Miner was doubtless induced to attempt an exposé by the belief that "Kingfisher" did not practice what he preached, but of this he had no knowledge until he saw the Black Lake letters. If Mr. Miner received information in July, 1883 (while he and they were there) that the "Kingfishers" were the violators, there is a greater certainty of the report having originated in malice, and a sudden collapse of the theory that the October party of Cincinnatians had been mistaken for the "Kingfishers." It is against reason to suppose that this slander was circulated before October, 1883, but in my opinion nothing was known of it until the publication of the Black Lake letters, and then it was given out by Merrill as I have described. It is not likely that the "Kingfishers" advertised themselves in July, 1883, as the original and only "Kingfishers." Had they done so, they would not have thought it possible for party No. 2 to have palmed itself off for the "Kingfisher" party. My theory is that Mr. Miner was at Cheboygan during the stay of the second Cincinnati party, and was told of their misdeeds; that after the appearance of the Black Lake letters and public utterances of Merrill, he was informed by letter or otherwise that this was the party with whose unlawful actions he was familiar. Hence his attack in good faith one year after the occurrence. —ONYX.

FISHING TACKLE.—On the principle of preparing for war in time of peace now is the time to overhaul the fishing tackle and put it in readiness for the spring campaign. The rods should receive careful attention and the ferrules tested to see if they have loosened by any change of temperature or by the strain of last season's work. The whippings should be replaced if frayed, and, if necessary the rod should be varnished. If the angler is not expert at this work he should send it to his rod maker whom he knows to be the most expert of all, at least he believes him to be, which is just as well. Reels should be cleaned and oiled, lines and leaders should be tested and if there is any frayed gut in the leader or among the fly snoods cut it out and tie it anew. Fly snoods should be free from all cracks where the gut joins the fly, the most usual place for them to break, and the fly should be re-tied or the gut cut and whipped on tight, with silk. This is pleasant work for winter evenings and brings its reward in finding all things in readiness for the first trip to the streams.

DERIVATION OF "MASKINONJE."—New York, Jan. 2.—*Editor Forest and Stream:* In the foot note to the article entitled "A New Year Fishing Trip," Mr. Mather ventured an etymology of the word *mascalonge*. He might safely have gone further. It is hardly necessary to remind so accomplished an Ojibwa scholar that *mas* means "spotted" or "speckled." Thus: the Nipigon Indians (Chippewas) call

the lake trout (*Salvelinus namaycush*) "namaycush;" the brook trout, "mas-namaycush" and they assured me that *mus* had the meaning above given. If the distinct spots of the mascalonge be compared with the broken-line markings of the northern pike the reason of applying the adjective will be evident. "Maskinonge" is said by the "Encyclopædic Dictionary" to be the Algonquin name, and in "Hiawatha" "kenozha" and "maskinozha" are used as synonymous. I can have little doubt that "mas-ki-nonge" means simply "spotted pike." But like Mr. Mather I have learned the difficulty of expressing Indian sounds in our usual notation.—X. [This opens a new mine for etymologists who have always looked to the French and have concluded that the name was derived from *mask allonge* or long face. It seems more probable that the French twisted the Ojibwa name into their vernacular and made *maskinoje* into mascallonge, maskanonge, etc. We will be pleased to hear further from our Ojibwa scholars.]

A VALUABLE SITE FOR A HATCHERY.

BY permission of the U. S. Fish Commission we publish the following communication to Mr. Livingston Stone of the U. S. Fish Commission:

I have just finished reading in the *Oregonian* your valuable and interesting report entitled "Salmon Hatching." May I call to your notice a stream not mentioned by you and which may possess some advantages for propagating several varieties of the salmon family. The stream to which I refer is called Hood River (Dog River of Dr. Suckley) and falls into the Columbia on south side about twenty-three miles west of the Dalles. This river receives the drainage of the north and east sides of Mount Hood, and is for its entire length, some 30 miles, a rapid mountain torrent, carrying a large body of water nearly equal in volume to that of the Kilkitat. I wish to speak more particulary of the west fork of this stream, which has its source in and forms the outlet of what is known as Lost Lake, a triangular shaped body of water, some ten miles due north-west of Mount Hood. This lake is not less than three miles in circumference, very deep and abounds in mountain trout. About twelve miles from Hood River Railroad station this fork unites with the main river. The waters of the west fork are at all seasons clear and cold, while the other branches of the Hood River late in summer are colored with volcanic detritus. About eighty rods up the west fork above the main river is a perpendicular fall of say fifteen feet and immediately below the fall a large circular basin of unknown depth. A few feet below this basin a bold mountain stream falls into the west fork, falling several hundred feet in a few rods. Salmon, mountain trout, red spotted salmon trout (*Salmo spectabilis*) and Hood River silver trout find their way in large numbers to the foot of the falls where their further progress is impeded, except at times of extreme high water. I have fished in many streams—fished in Northern Vermont thirty years ago; in many of the streams of Oregon, Washington and Idaho as far north as the 49th parallel, and have yet to find any stream superior to the west fork of Hood River for the varities and size of its trout.

The *Salmo spectabilis* is found of very large size, probably ten pounds or more in weight, but the fish most plentiful is what is known as the Hood River silver trout. This fish exters the river about August, I think, and is found there until next spring. It resembles a small silver salmon, of the average weight of say two pounds, some much larger, very fat and most excellent for the table. It is singular that this fish is not found in any of the neighboring streams—the White, Salmon, Klikitat, &c. It was not supposed that they would rise to the fly, but last September I had excellent sport taking them in that manner. Many were so large as to carry away my tackle at the first onset. It seems to me that they would prove to be a most excellent variety for stocking many small rivers. They are very abundant and full of spawn in August and September. As to the supply of large salmon I am not certain. I saw the back-bone of one over three feet in length on the bank and saw them jumping in the river, but cannot speak as to the variety or quantity. With this exception the locality I speak of posses every requisite mentioned in your report. With slight improvement the road would be hard and excellent the entire year. There is abundance of water on the ground and water can be conducted if necessary two hundred feet above the stream. There are no settlers above and none to interfere below the falls. It is an ideal place for a hatchery for several varieties of trout and salmon, but as I stated before am not certain as to the numbers of larger salmon. The climate is all that could be desired with the exception of considerable snow during some winters. With this exception I think it is as good as any place in Oregon. I would like to see a Goverment hatchery at that place, but if not desirable for that purpose, may I ask your advice as to whether a private hatchery could be made profitable? I would like to undertake such an enterprise in connection with some one of practical experience, provided the outlook was favorable. When I was at the falls last season the silver trout were trying to jump from the pool to the river above, but all that I saw failed in the attempt and fell back again. Dr. Suckley does not describe this fish in his report. If you have the patience to read this hasty letter and think its subject matter of interest I shall be pleased to furnish any further information.

I note your remarks relative to the Pen d'Oreille River. Eleven years ago I assisted in running the "boundary line" between Idaho and Washington Territories from Lewiston north to the 49th parallel or International boundary. Our line crossed the Pen d'Oreille in plain sight and a little below the falls you mention, which are about eight feet height. Below the falls the river runs slowly for not less than twenty miles as near as I can judge before it forms a cañon. The head of the cañon must be some ten miles below the old St. Ignatius Mission. At the point of crossing we caught trout and a slender white fish, but saw no signs of salmon. About the old Mission, now abandoned, were fine meadows of timothy and red top, but the Indians are not to be trusted. From the Little Spokane to the Pen d'Oreille River following up the first named stream is a natural route for a wagon road. Lake Kaniksee, the waters of which flow into the Pen d'Oreille above the fall mentioned is a very beautiful body of water, estimated at twenty miles in length. The Indians have a horse track; from the Old Mission to this lake where they dry and smoke large quantities of trout. If you have any ambitious tourist in mind who is desirous of exploring unknown lands, I know of no more interesting locality than this lake. Hon. M. C. George, Senator J. N. Dolph at Washington, or Gen. Moody of Salem will, I think, vouch for the correctness of any statements that I may make. E. L. SMITH.

THE DALLES, Oregon.

THE NEW YORK COMMISSION.—The dam built to supply the Adirondack hatchery at Little Clear Pond, now called by the Commission Lake Brandon after the township in which the greater part of the lake lies, broke away last week and let the water down with a rush. The hatchery floor was flooded and the men got about in boats. After the flood subsided Supt. Walters placed his trays of eggs in the creek where they will hatch if no freshet sweeps them away. It is not known what caused the break but it is thought that there is a bed of quicksand under the dam which made the trouble. Only the western end of the dam gave way and it can easily be repaired at the proper season, but it happened at a very bad time, when the troughs were full of eggs. We do not fear for the safety of the eggs unless a sudden thaw, which is unlikely in that region, sets in before they are hatched and able to swim. It is just such emergencies that a competent fishculturist usually meets with a device or shift of some kind which tides him over an accident and Mr. Walters has done the only thing possible at this time. At Cold Spring Harbor the hatchery is just filling up. There are now in the troughs 100,000 eggs of brook trout belonging to Mr. John D. Hewlett, which he purchased from Mr. James Annin; 15,000 of the same taken from the few fish in the ponds; 150,000 eggs of the lake trout from the U. S. F. C., at Northville Mich. This week 500,000 salmon eggs will arrive from Maine for the U. S. F. C., the fry of which will go into the Hudson and elsewhere. 32,000 eggs of the brown trout are expected from Germany and 1,000,000 whitefish from Michigan. Smelt hatching will be continued in March. In the salt water department there are 1,200,000 eggs of the tomcod and a few codfish eggs which are developing.

BROWN TROUT.—Plymouth, Mass., Jan. 4.—*Editor Forest and Stream:* I received in February 1882 from a gentleman in England some four thousand English trout eggs (*S. fario*). They were exposed to heat while in transit, and not over thirty good eggs in the whole lot. I got about twenty-five good fry from them, and when old enough, I put them into a vacant pool. They received very little attention until last year, when I found there were some ten or a dozen of them, some of which were eight inches long. I put them into a larger pool with a lot of brook trout of about the same size, and now some of them will weigh a pound or more. During the past week three of them have spawned, and I succeeded in getting about three thousand eggs from them. They are nearly twice as large as brook trout eggs, and of fine color. I think these are the first English trout eggs ever taken in this country.—W. L. GILBERT. [Eggs of the brown trout have been taken this year at Cold Spring Harbor, N. Y.; Caledonia N. Y., both at the State works and by Mr. James Annin; and at Northville, Mich. We cannot say who was actually the first and as they all took eggs within the same month it is not important. We think that Mr. Gilbert will find this fish is a most valuable addition to his ponds.]

CODFISH HATCHING AT WOOD'S HOLL.—The work with codfish eggs at the U. S. Fish Commission station at Wood's Holl, Mass., has been very successful. Col. McDonald has been down there for a few days and between him and Capt. Chester they have arranged the proper apparatus. Prof. T. J. Ryder is also there attending to the embryology of the fish. The specific gravity of the water there is 1.025 and the eggs float at the surface for the first few days and afterward sink. At Cold Spring Harbor the water is 1.022 and the eggs will sink if the water is perfectly still, but at first are suspended in a very slight current.

FIXTURES.

BENCH SHOWS.

Jan. 5 to 12.—First annual exhibition and dog show of the Central Indiana Poultry and Pet Stock Association, at Indianapolis. J. W. Elliott, Secretary.

Jan. 19, 20 and 21, 1886.—Annual Exhibition and Bench Show of the French Creek Valley Poultry and Pet Stock Association. A. L. Braden, Secretary.

Jan. 26, 27, 28, 29 and 30.—Fourth annual dog show of the Southern Massachusetts Poultry Association, at Fall River, Mass. R. G. Mosher, Secretary.

Feb. 8, 9 and 10.—Fourth annual exhibition of the New York Fanciers' Club, at Madison Square Garden, New York. Chas. Harker, Secretary, 62 Cortlandt street.

March 16, 17, 18 and 19, 1886.—Western Pennsylvania Poultry Society's Dog Show, at Pittsburgh, Pa. C. B. Elben, Secretary.

March 23, 24 and 25, 1886.—First Annual Dog Show of the New Jersey Kennel and Field Trials Club, Newark, N. J. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

March 30 to April 2, 1886.—Third Annual Dog Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Edward A. Moseley, Secretary, Boston, Mass.

April 14, 15 and 16. First Annual Dog Show of the Hartford Kennel Club. A. C. Collins, Secretary, Hartford, Conn.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **3092.**

THE CHATHAM DOG SHOW.

THE Peninsular Dog and Pet Stock first annual show was held at Chatham, Ont., Dec. 29 to Jan. 1. Chatham is forty miles east of Detroit and has always been to the front in the dog line, as notable Dido and Dido II., whose names are quite enough to stamp the place in the memory of dog lovers.

The show was held in a suitable building, very comfortable for the dogs and poultry but very much too small to render it possible to see the exhibits with any comfort.

The Secretary, Mr. Macpherson, we welcome as a new and most enthusiastic dog man, and from the character of the dogs he has and is importing I prophesy a brilliant show career. His management was good, and everything ran smoothly, even to disappointed exhibitors. The judging was done by Dr. J. S. Niven, of London, and there was little to grumble about after his decisions were made.

Among the dogs which we noticed chiefly was Mr. Platt's English setter London II., who, though rather too young and out of condition, shows many good points, especially head and ears, which are excellent. Mr. Wells's pair of puppies by Dover out of Star, will be heard from later. In collies there was rather a surprise in Gibson & McEwen's pair Gilderoy and Nameless, which far exceed, in my mind, anything that has been exhibited in America; but I trust they will be seen at New York next spring, when I think FOREST AND STREAM will give them an extended notice. Mr. Gibson's fox-terrier Fennel never looked so well and is a terrier all over. Mr. Macpherson's St. Bernard Rudolph II. has the best feet and legs I have seen on one of his size, but his markings, brindle and white, I don't like. The same owner's great Danes Siegfried and Lady Sawtelle were a great addition to the show. Below is a complete list of the

AWARDS.

ENGLISH SETTERS.—*Dogs:* 1st, J. E. Platt's London II.; 2d, S. Holmes's Duke. High com., Ontario Kennel Club's Ben. *Bitches:* 1st and special, Jos. Kyme's Lucy Bee; 2d, Jos. Kyme's Lady Thunder. *Puppies:* 1st and 2d, W. B. Wells's Star II. and Dover. Very high com., Jos. Kyme's Blue Joint. High com., R. J. Day's Romp.

GORDON SETTERS.—1st and special, F. W. J. Ball's Lottie; 2d, Chas. Northwood's Tory. Very high com., G. V. Atkinson's Jim, Jr.

POINTERS.—*Dogs:* 1st and special, W. E. Rispin's Shot. *Bitches:* 1st, Jos. Kyme's Dart; 2d, S. Holmes's Molly. *Puppies:* 1st withheld. 2d, S. F. Pierce's Don.

COCKER SPANIELS.—1st and special, Andrew Laidlaw's Belle; 2d and special, Chas. Shot's Niagara Maid. Com., Andrew Laidlaw's Don.—OTHER THAN COCKERS—1st, Andrew Laidlaw's Young Bob.

FOXHOUNDS.—1st and special, T. Goodland's Belle.

GREYHOUNDS.—1st and special, Proctor, Hadley & Roche's Snowflake.

FOX-TERRIERS.—1st and two specials and very high com., Mc Ewen & Gibson's Fennel and Nick; 2d, J. M. Macpherson's Avenger. Very high com, reserve, and high com., Thos. Holmes's Rattler III. and bitch puppy.

SCOTCH TERRIERS.—1st and very high com., Wm. McNeil's Magar and Magar II.; 2d, D. Holmes's Pussie.

COLLIES.—1st and special and 2d, McEwen & Gibson's Gilderoy and unnamed. Very high com., Fred Goodland's Ned, Jr. High com. and com., R. J. Hallinan's Peggy and Larrie.

NEWFOUNDLANDS.—1st and special, John McCann's Bruno; 2d, A. Northwood's Rex.

ST. BERNARDS.—1st and special, J. M. Macpherson's Rudolph II.

BULL-TERRIERS.—1st, W. A. Shaw's Miss Norah; 2d and specia Proctor, Hadley & Roche's John C. Heenan.

IRISH TERRIERS.—1st and speciat, J. E. Thomas's Pat.

TOYS.—1st, Geo. Webber's Tip; 2d and high com., John Watson's pug dog and bitch. Very high com., Thos. Blake's Yorkshire terrier bitch.

MISCELLANEOUS.—1st, J. M. Macpherson's Great Dane dog Siegfried; 2d, W. B. Wells's harrier bitch Fairy.

CHATHAM.

BROOKLYN FANCIERS' CLUB'S DOG SHOW.

THE first annual exhibition of the Brooklyn Fanciers' Club was held in Brooklyn, Dec. 28, 29 and 30. In addition to the poultry and pigeons there was quite a dog show and some good specimens were exhibited.

Following is a list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, F. Mendike's Sir Rolf. *Bitches:* 1st, F. Mendike's Juno; 2d, O. Lehman's Turk. *Puppies:* 1st and 2d, G. R. Gildersleeve's Major and Leo.

NEWFOUNDLANDS.—1st, W. Hanrahan's unnamed.

BULL-TERRIERS.—*Dogs:* 1st, A. Schaengan's Dick. *Bitches:* 1st, G. R. Gildersleeve's Lillie. *Puppies:* 1st, J. Grerol's unnamed.

ENGLISH SETTERS.—1st, G. R. Gildersleeve's Dawn.

IRISH SETTERS.—1st, G. R. Gildersleeve's Nelly.

BLACK AND TAN SETTERS.—1st, G. R. Gildersleeve's Queen Bess.

FOX-TERRIERS.—1st, G. R. Gildersleeve's Tiny. *Puppies:* 1st, G. R. Gildersleevs's Browny.

DACHSHUNDE.—*Dogs:* 1st, H. Rover's Erdmann. *Bitches:* 1st, G. R. Gildersleeve's Bella.

PUGS.—*Dogs:* 1st, Mrs. W. J. Burkart's Punch; 2d, G. R. Gildersleeve's Dick. *Bitches:* 1st, Mrs. W. J. Burkart's Judge. *Puppies:* 1st, P. Buerlin's unnamed.

BLOODHOUNDS.—1st, P. Opp's Garibaldi.

YORKSHIRE TERRIERS.—*Dogs:* 1st, J. H. Burkart's Spider. *Bitches:* 1st, J. H. Burkart's Fly; equal 2d, J. H. Burkart's Nellie and G. R. Gildersleeve's Lillie.

TOY TERRIERS.—1st, J. N. Braley's unnamed; 2d, J. H. Burkart's Nibbs.

COCKER SPANIELS.—1st, W. J. Stanton's Jennie.

BLACK AND TAN TERRIERS.—*Dogs:* 1st, J. Slater's Prince. *Bitches:* 1st, G. R. Gildersleeve's Nellie.

IRISH TERRIES.—1st, E. C. Mohr's Clip.

BEAGLES AND COTTON TAILS.

Editor Forest and Stream.

I was invited on the 18th of November by Mr. John Davis to meet his guests, which were invited to take a rabbit hunt, I to furnish the music. So by dawn of day I was busy getting things in shape, feeding my little pets, and putting them in a cage, which I have to fit in the hind part of my wagon. As I was to furnish the music, I put in twelve of my best muscians and was off to the grounds—and you bet they played. By a little after sunrise I had driven to the grounds, and the party was in readiness when I arrived. So after the salutations of the morning, the tail gate of my wagon was let down, and out scrambled my little pets, of an average height of about 14 inches; over the fence—low it was—and in the swamp they were soon giving tongue and in a few moments up they bounced a "cottentail." Then I exclaimed the band will play, and off they went in full clash, through the swamp, over the hill, back in the swamp and out in some open ground, sometimes by scent and sometimes by sight. Soon the excitement got up to an enjoyable pitch. One race after another in quick succession, and soon three were bagged, the third rabbit was caught close to the house of Mr. Davis's brother—one of the party—we all went up and cleared our throats. Then off we went in another direction and soon there was another bounced. Across the field dogs and rabbit went by sight, down to a little swamp and at the close of the chase, up the dogs jumped another, and up and down the thicket went rabbit and dogs and soon there were two more added to our bag. We then crossed over to another swamp and were no sooner there than up the dogs bounced another; through the bushes down the road by sight, back in the bushes again. Then across the road rabbit and dogs right through the whole party of huntsmen who were grouped in the road; in the swamp they went and suddenly the dogs stopped and commenced baying at a hole in a tree. The rabbit was in reach, pulled out, and was nicely bled and bagged. Then we moved off for some thick pines, killing two on our way. Here we had some fun. Up jumped a rabbit near the pines, and in it went, but the little chatterboxes made it so hot for poor Molly, she had to come out and try to make for the weedy field, but before she could reach the thick woods, she felt the ivory hackles of my pack. Then we formed a ring, and while passing the cup around, up one of the dogs started another; the cup had passed me, so off I went, the dogs in full chase, sometimes by sight and nearly all the time close to the rabbit; under a rail pile it went, but before we could get there out it came, with the dogs in full sight and they soon closed in on poor cottontail. So the day went merrily on, until we had bagged sixteen rabbits out of seventeen starts, and the missed one run under an outhouse. The last rabbit was bagged about sunset, near the house of Mr. Davis and the ladies of the house had the pleasure of hearing the last chase. We were then handsomely entertained, and our parting admission was, we have had sport enough for one day.

POTTINGER DORSEY.

THE FOX-TERRIER CLUB.—There was a meeting of the American Fox-Terrier Club at Delmonico's, New York, on Friday evening, Dec. 30. Several gentlemen were proposed for election as members of the club. Messrs. E. Kelly and F. R. Hitchcock were appointed to confer with the bench show committee of the Westminster Kennel Club, with the view of obtaining special facilities for the exhibition of fox-terriers at the forthcoming dog show. The treasurer's report showed a satisfactory condition of the finances of the club. It was voted that all terriers competing for prizes given by the club shall be registered with the secretary, with age, markings and pedigree, and that a fee of fifty cents be charged for such registration. Two members of the club offered a handsome cup each as a prize to be competed for under the following conditions: The stake to be known as "The American Fox-Terrier Club Produce Stake." Free for all. The cups to be added to a sweepstakes of $1 each, for dogs and bitches, the produce of fox-terrier bitches to be registered with the secretary on or before July 31, 1886. To be competed for in 1887. Entries to be made previous to whelping. The Secretary's address is Edward Kelly, 135 Fifth avenue, New York.

THE GRAPHIC CHALLENGE.

Oh wa'd some god the giftie gie us,
To see airselves as ithers see us.—*Burns.*

Editor Forest and Stream:

In my last letter relating to "Graphic's Alleged Flush" I stated that I had no intention of allowing myself to be dragged into such a "tempest in a teapot" as Mr. James L. Anthony is trying to foment, and I endeavored to show that it is the duty of dog owners to protect their reputable judges from clumsy abuse and vulgar innuendo. A man naturally feels some reluctance in alluding to anything that has been universally condemned, but there are one or two points which should be carefully noted before this Graphic business is effectually disposed of.

By keeping a close watch on Mr. James L. Anthony we find ample evidence that he is not the heaven-installed rectifier of abuses he professes to be, and we also find some evidence tending to show that Graphic was withdrawn for other reasons than those advanced by his owner or owners. His withdrawal was a blunder; the smarter plan would have been to have instructed his handler to get lost. I would especially call the attention of your readers to the following:

(1) "I have not yet seen it stated in print, but I am, nevertheless, assured most positively, that after Beaufort had been awarded the heat against Lucia, Mr. Anthony did his utmost to get a protest made against the decision, but without success."—"Porcupine," in the *Sporting Life*, Dec. 30.

(2) "As he (Graphic) had not retrieved in either heat, they (the judges) decided to see how he would acquit himself in this * * * and ordered them on, when Mitchell very foolishly protested, but after a few words sent on his dog. Graphic soon pointed, when a dead bird was thrown and Mitchell to order fired a shot and Graphic was sent to retrieve, he went to the bird and picked it up, mouthing it badly, but Mitchell was close by and took it from him."—FOREST AND STREAM, Dec. 4.

(3) "We will match Graphic against Mainspring * * * for an all day's race * * * during the second week in March, 1886, Capt. McMurdo to handle Mainspring * * * Mr. B. F. Wilson, of Pittsburgh, to be the sole judge, and retrieving not to be counted * * * If Graphic or his progeny are fairly beaten in either or all the contests, as they may be," etc.—Chas. Heath, James L. Anthony.

(1) If "Porcupine" has stated facts—and he seldom goes wrong—there is evidence that in the early part of the trials Mr. James L. Anthony wished to get rid of a certain dog and took cowardly advantage of the owner's absence to get a protest made. (2) Proves an attempt to coerce the judges into a decision in favor of Graphic before they had an opportunity of testing him as a retriever, and of course shows that after Graphic's wretched display Mitchell's hand was exposed and that the dog's chances of winning another heat were hopeless. (3) *La crême de la crême*, and finally settles the whole business. The owners of Graphic clearly admit the dog had no chance of winning when retrieving did count, and they acknowledge that after they have fixed the date for the race, named the handler of their opponent's dog, selected their own judge, etc., Graphic "may be fairly beaten." That is Mr. Anthony's case, and in pathetic terms he appeals for support from "the public and all fair-minded sportsmen who love a good dog for the pleasure he can derive from his ownership." (Stud fee, $100.) It is not quite clear to me why a dog that "may be beaten" after his owners have excluded from consideration his weak points, named the handlers, appointed the judges, etc., was ever entered for competition at a field trial. This shows lamentable ignorance on the part of somebody.

Messrs. Anthony and Heath's statement that they "did agree to Mr. Donner, but on the mistaken idea, so far as Mr. Anthony was concerned, that he was not a member of the Westminster Kennel Club," is exploded by the fact that Mr. James L. Anthony entered his dogs to be judged by Mr. Elliot Smith, another prominent member of the W. K. C. and known to be such by Mr. Anthony. I again assert that Mr. Anthony had no business to be riding with Mr. Coster, and the rules of the Eastern Field Trials Club prove I am right. It is to be hoped that we shall hear no more about Graphic's alleged advertise—I peg pardon—flush. To show Mr. Anthony how thoroughly disgusted are some of his countrymen, I will quote from a letter received this morning from a prominent member of one of the most influential clubs in this country. To my knowledge I have never seen the writer, certainly I have never conversed with him: "I wish you would favor the public with more of your entertaining letters, like the one in the last issue of the FOREST AND STREAM. It is quite refreshing after reading the 'blow' of Dog Broker —— * * * This Graphic trouble is not doing much toward convincing the general public that a man can take an interest in dogs and still be a gentleman."

Now for the new ad., *i. e.*, the challenges. They are without exception the funniest things I have ever seen or heard. I hope this statement will not result in an action for libel. The law has grown very elastic since the hydrophobia scare spread its wings over Newark and certain parts of your city. Still it is hardly probable that because a man has bought and sold a dog, the laws, especially the laws of nature, will be revoked.

"To the public and all fair-minded sportsmen who love a good dog for the pleasure he can derive from his ownership, we will say, we decline to discuss through the FOREST AND STREAM or any other paper, any question affecting dogs, field trials or bench shows with any professional dog dealer or handler. We, however, value the good opinion of all honest men, no matter what their vocation, and that the latter may know the truth, make the following statement." By your courtesy I will put the dissecting knife to work on the above, and I hope it won't cut deep. A man who knows nothing about dogs would be a fool to discuss them. Do fair-minded sportsmen make such challenges as Mr. Anthony has presented? What is the difference between an amateur dog dealer and a professional dealer? One understands dogs, I suppose, and the other does not. Is Mr. Anthony's challenge to Mr. Perkins consistent with his ambition to be considered a lover of dogs for the pleasure he can derive from their ownership? Is Mr. Anthony aware that his insinuation that dealers and handlers are dishonest will recoil on his own head? Mr. Anthony has a handler of his own. I never knew before that a fashionable cut coat and a long purse are the adjuncts by which honesty is measured.

"Honor and shame from no condition rise;
Act well your part—there all the honor lies."

One morning of last year an individual strangely resembling Mr. James L. Anthony called upon me and asked the price of Beaufort, where he could be seen, what his stud fee was, etc., etc. "Not for sale; stud fee $50," was the reply, and the individual disappeared. Some time before this early morning call a gentleman who had seen Beaufort was asked to purchase Graphic if in his opinion he could beat Beaufort. This gentleman went to see Graphic, and after looking him over very carefully told his owner that he would not do, as there was a better dog in America. Not long after this the Knickerbocker Club sent to England for Graphic's price, and they could have purchased him for $600. Finally Mr. Anthony purchased the dog for about $700, and after keeping him a few weeks sold him to Mr. Heath for $2,000. At least this is what he says. If Mr. Anthony "loves a good dog for the pleasure he can derive from his ownership," why did he sell Graphic, and where is the evidence that he is not a dealer? *L'argent, Monsieur Anthony, toujours l'argent!* Either Mr. Anthony sold Graphic to make money out of him and is a dealer, or Graphic is not a good dog and Mr. Anthony does not love him. Sit on either horn of the dilemma you like best, Mr. Anthony, but I will pin you down to one of them. My own impression is that Mr. Anthony discovered at the Philadelphia show that a large majority of the pointer men present preferred Beaufort to Graphic, and so he sold the dog. Mr. Green, of the Knickerbocker Club, told me he was very pleased Mr. Anthony and not his club had purchased Graphic, and when I asked why he replied, "You know why; Beaufort can beat him."

I could have purchased Graphic long before Mr. Anthony got him, and at a much lower price than he paid, but he was of no use to me when I owned a better dog. Wagg, a very much better specimen than Graphic, was offered to me for £100, and I should have taken him at the price if I could have satisfied myself that he was of any value as a stud dog. Mr. Price paid £100 for him and would pay £100 again for such a dog; but I am not aware that he ever paid £100 for a bench dog that was not somewhat better looking than Graphic. While the latter is undoubtedly a grand dog—much superior to Bang II., for instance—he is not a Wagg or a Beaufort. If Mr. Anthony knew anything about English pointers I would go into particulars—"take up the running"—but my doing so would be useless until he has learned something of the characteristics of the breed.

Mr. Anthony says he paid $1,000 for Revel III. The bitch was catalogued at Birmingham, 1884, to be sold for £110, but nobody claimed her. At the Crystal Palace show of 1884 and 1885 she was catalogued at the same price, and again there were no buyers. She was offered to a gentleman in this country for something less than $400 and I have seen the letter. These are undeniable facts and I would ask are they consistent with Mr. Anthony's statement that he "loves a good dog for the pleasure he can derive from his ownership." There is something very unsportsmanlike about all this and it is certain to be condemned. If Mr. Anthony paid $250 for Revel III. what is his object in saying he paid $1,000? The public and "all fair-minded sportsmen" will soon assign a reason for it. If on the other hand he really did pay $1,000 for the bitch, what does he think of himself as a judge of dogs? It is not quite clear why Mr. Anthony wishes to match Graphic against "the best pointer living" unless it is for the sake of advertising his or Mr. Heath's dog. The "acknowledged best pointer living" will never be placed behind Graphic by a judge of pointers, and his owner will take chances when showing him under incompetent judges.

I submit the following for Mr. Heath's consideration: (1) If Graphic is owned by Mr. Heath I will show Beaufort against him for a piece of plate, value $100, and if Graphic wins, Mr. Heath may claim for his dog the title of champion of the world. (2) I will show a brace of pointers against a brace of Graphic's progeny for a piece of plate value $100. (3) I cannot recognize that little "we." (4) No arrogant "deputy" of Mr. Heath's to be allowed in the ring while the dogs are under judgment. (5) Three or five honorable and qualified men to judge. (6) The owner of Beaufort as well as the owner of Graphic to have a "say" in the appointment of judges. (7) Graphic's structural faults, his ringtail included, to count against him. No points to be exempt from judgment (*vide* condition 3 of challenge to owner of Mainspring). (8) If the owner of either dog sees he is getting the worst of it he shall not withdraw his dog (*vide* report of Eastern field trials and subsequent correspondence thereon). (9) All correspondence pertaining to the match to be public. (10) The contest to take place in New York city during the month of May 1886. (11) No such tomfoolery as a "record of points" to be attempted. (12) Guns, powder, shot and vicious handlers not to be allowed within the judges' ring.

Messrs. Heath and Anthony conclude their one-sided challenge as follows: "If Graphic or his progeny are fairly beaten in either or all the contests, as they may be, we shall not be found wanting either in good nature or generous praise for the owner, breeder, or handler of the opposing dog or dogs." I don't quite see how these gentlemen are to know whether the dogs are "fairly beaten" or not, as neither of them is a judge of pointers. CHAS. H. MASON.

Bay Ridge, L. I. Jan. 5, 1886.

IS THE A. K. C. TO LIVE?

Editor Forest and Stream:

When I asked the above question in the columns of FOREST AND STREAM some months since, it seemed to me that an affirmative answer could not be given. The dead weights on the club seemed too many and weighty ever to be rid of. The late meeting at New York, while not conclusive that the association was certain to rise to the situation and make itself all that a central, governing and respected body in kennel affairs should be, still gave promise that the reign of blunders and "you tickle me, and I'll tickle you" principle has run its course. The so-called "Sensation" amendments were certainly the most gigantic blunder that has marked the course of the A. K. C. on the face of it, and as far as the public is informed, there was no earthly object to be subserved by them except making Sensation eligible to the champion class; if there was any other reason for their proposal, if they were based on any sound principle, it is the duty of the proposer, to himself, to the A. K. C. and to the public to state what that was; until this is done there seems no other conclusion open but the very disagreeable one that they had a private end in view. The whole question of a governing kennel club is surrounded with difficulties, the idea of one of clubs will probably work as well as any other for the present, and has the advantage of being easily started and run, but to be a success it must of all things impress on the dog public that it is above all narrow, selfish exclusiveness, and unfortunately this is just what the A. K. C. has not done. The immense stupidity of making wins count only at shows held by members of the A. K. C. is unique; just take a case. The Winnipeg club held a show, the club was a member of the A. K. C. Mastiffs were judged by "Lord knows who," I am sure I forget, and am also sure that the opinion of the judge would be held by mastiff men as about as weighty as that of the patron of "true cockers." Some dog won, and that win counts toward eligibility in the champion class. Now at the Breeders' show, mastiffs were judged by the breeders of such famous cracks as Victor, Bosco, Norma, etc., yet these wins do not count. The dictum of "Lord knows who" is weightier than that of the one eminent authority we have in this country, "Oh!" says "Yellow Plush," 'that was a private speculation." Who cares what it was? The thing that interests the mastiff man is, were the classes full and did the judge know his business and honestly do it? Are none but sacred members of the A. K. C. to indulge in the privilege of "speculation?" Did no member of the A. K. C. ever make any money by a show? and did a member of the A. K. C. ever hold a show and diddle the Superintendent out of part of his pay, or did no one ever bilk the exhibitor out of special premiums won? What is the sense of elevating A. K. C. members so high? I venture to say, that for one piece of dirty business done by a "private" show, I can name ten done by an august member of the A. K. C., august in its membership if in nothing else. The "private" shows that I can recall as of moment were those at Washington (the first) and the Breeders'; and with the exception of New York, Boston, New Haven and Philadelphia, there have been no other shows in the country the equal of these in quality of exhibits and in calibre of the judges. Yet wins at Pittsburgh, Cleveland, Chicago, Cincinnati, or that grand fiasco at St. Louis, are entitled to more weight than at the two "private" shows! Until the A. K. C. can get such dunderheaded foolishness as this out of its head, it can never be a success, nay, more, it cannot live, abortive twitches of the limbs, resulting from galvanic applications, are no more living in the case of the A. K. C. than they are in the case of a dead frog, and flusters about twice a year productive of more fun in the newspapers than of practical service to kennel interests, are only twitchings of the legs after the body is dead.

I am *sure* that the members of the A. K. C. are above such small business, and if New Jersey may not be added to the number, I miss my guess. An enormous gain to the A. K. C. was the disappearance of the western "Mrs. Harris" clubs from the late meeting. They and their proxies have been terrible drags on the Club, as there was no interest in fighting for better things, when one had to fight one living man and five proxies. If the A. K. C. is to succeed, let their first duty be to prepare a list of shows in the past conspicious by good management, good judging and good classes, and let these count for champion honors; such a course will do more to elevate the association in public esteem than any amount of drivel about "private speculations."

Such a course will do much to relieve the club from the "holier than thou" idea that has been so mischievously prominent in the A. K. C. in the past. The idea that any club is one mite more discreet, reputable or wise than the material it is composed of, or of the doggy public in general, is rank nonsense. The experience of the A. K. C. in the past has demonstrated as clear as the sun in noon day, that it cannot make headway against the general feeling of contempt it evoked by its course in the first year or so if its existence, so what in the world is the sense of longer masquerading in the robes of the pharisee? The fact is, that it will require exceedingly nice steering to save *all* show interests from shipwreck this coming year. It really seems to me, that the more an owner pays for his dogs, and the higher he values them the less he cares for dog shows. One prominent exhibitor who about swept the board last year, has practically retired. I can name several of the old time pillars of shows, who are saying "Oh be hanged to your shows." Why this is so would be a lengthy matter for investigations, and perhaps no satisfactory solution could be given, but that it *is* so, is beyond dispute.

Then "the kicker" is around, and more defiant than ever; he has even invaded the sacred shades of the field trial, where all used to be as demure as a Quaker meeting. "Porcupine," with a singular lack of his usual acumen, proposes to change this by a tighter gag law than that of old, but if he thinks *any* gag will shut the mouth of the *true* kicker, when he feels he has been wronged, his wits are sadly deserting him; of course I am not expressing any opinion as to the merits of the "unpleasantness" at the late Eastern trials. (There has been lots said about "a flush", is that any relation of the flush that beats four of a kind?) We will always have kickers of the sorehead variety, and like all other disagreeables, we must put up with him as best we may, but it is suicide to elevate him to undue prominence by any gag games that will put him on the same footing as the *true* "kicker," the mugwump who will renovate canine affairs, if they be renovated, and if clubs think that the true American is going to pay any respect to high sounding professions, and "associations of all the clubs in America" without some better ground for reverence than has yet been afforded, they are mistaken, that is all. We are not alone in this state of affairs; the same feeling is abroad in England. Look how the O. E. M. Club got scored for their handling of the Crown Prince inquiry case; look at the hot water the Collie Club have gotten themselves into, and note the disposition to scout even the mighty Kennel Club itself, when it has come short. One doughty warrior told me that he was just waiting for a chance to mingle in the fray, and tumble from their tinsel thrones the shams and humbugs that have so enveloped themselves around canine matters. Let us devoutly hope that such glorious fun will not be lost, and meanwhile, treat with contempt all the self arrogations of supreme wisdom that we have been so dosed with in the past, such as that precious rot, that "the interest of clubs and exhibitors are so bound up, that no club can possibly afford to neglect justice to the exhibitors." What an elegant preventive of bankruptcies this would be if it could be established as part of our business and social life. W. WADE.

HULTON, Pa., Dec. 30.

The following reply has been brought out from Mr. John W. Munson, according to the *Sporting Life:* "St. Louis, Dec. 31.—Assuming that the recent challenges of Graphic's owners are sincere and not made to advertise the dog, and assuming that they are willing to show him at such bench shows and under such judges and rules as are satisfactory to the men who own pointers, and with the hope of drawing him (Graphic) into public competition where he can win something more in America than newspaper notoriety, I make them the following offers: I will show a pointer dog against Graphic, in the same class, at the Westminster Kennel Club's spring show in New York. I will show a large pointer bitch against one of Graphic's get, same class. I will show a brace of pointers, sired by the same dog, against a brace of Graphic's get. I will show a dog or bitch, sired by the same dog, against a dog or bitch of Graphic's get. I will show three pointers, sired by the same dog, against Graphic and any two of his get. I will show five pointers against Graphic and any four pointers his owner can show of their own." Mr. Munson would prefer that these challenges should be taken up for the honor of winning, but if this is not acceptable to the owners of Graphic, he will bet $100 on each event, or will make each of them sweepstakes at $100 an entry. To this the following has been returned under date Jan. 4: "Mr. J. W. Munson, St. Louis, Mo. Dear Sir: We beg to inform you that our challenge as to Graphic and his get on the bench was made in perfect good faith and solely in the interests of good fellowship and for the improvement certain to result to the breed, as a breed from such a contest. Both of us are gentlemen, as you can most readily ascertain, and therefore we will meet you literally under the terms of our challenge and solely for the honor. We should have preferred receiving the communication from you direct instead of through the papers. We made a challenge. If you will notify us of its acceptance we will meet you at some time to be mutually agreed on during the month of May, 1886, provided we can also mutually agree on judges, but the Westminster Kennel Club can appoint no judges for us, besides they might be equally unsatisfactory to you or to any others accepting the challenge. Therefore we think when Feb. 1 comes, we had better meet and agree on time and place in May, 1886, and as to the judge or judges, as we might all conclude to let the Westminster Kennel Club show go and exhibit our dogs at some other place in the city of New York. Very respectfully yours, JAS. L. ANTHONY, CHAS. HEATH."

EARLY FOXOUND DEVELOPMENT.

Editor Forest and Stream:

For a number of years I have bred and hunted foxhounds of nearly every known variety, and have carefully noted their average period of maturity as based upon the development of useful hunting qualities. Two years is about the average age of dogs heretofore bred in New England, when they exhibit qualities worthy of being called useful; but the introduction of the Byron hound has materially changed this date, and not unfrequently now, dogs of a year old will drive a fox squarely from daylight till dark, though of course they do not reach perfection till they are three or four. A striking instance of this early development of the Byron breed was witnessed by me the other day. I was foxhunting with an old New England bred hound, and my Byron puppy Bugle, seven months old. The old dog was working up a cold track some distance off, when the pup, while running a thick cover, and working in grand style, suddenly threw up his head, snuffed a couple of times, and rushed into the cover. Immediately he began baying excitedly, and went off at a tearing gait straight away from me. There was just enough snow for good running, and when I reached the point where the dog started, I found a fresh fox track, and a place hollowed out in the snow under pine tree, where brother reynard had been ruthlessly aroused by the infant Bugle from his morning's nap. The pup ran rapidly and was soon out of hearing, and it was not till after an hour's hard tramp that I came upon him in a

swamp still driving the fox furiously. The old dog at this time joined in the chase, but was always from half a mile to a mile behind the pup. At one time I saw the fox in a field with the pup nipping at his hind quarters, but as soon as cover was reached the fox slipped away from him. The chase was in hearing after this most of the time till 3 P. M. when I broke through the ice in crossing a large brook, getting my rubber boots full of ice water, and consequently had to go home. The old dog turned up that night, but the pup did not, and was found the next day at a farmhouse eight miles from home, where he had tied up at dusk the evening before. This I call phenomenal running for a seven months pup, because he started the fox, and practically drove him the entire day, for he was always a good distance ahead of the old dog after the latter joined in the chase. Bugle was bred by Rhodes Bros., of Pioneer, Pa., and his sire Drive has a record in the FOREST AND STREAM of last winter of having run down, caught and killed two red foxes in one day. I consider the Byron hounds not only the earliest in development, but the surest and quickest drivers we have in this country. FOXCRAFT.

PORTSMOUTH, N. H.

A GOOD BRACE OF PUPPIES.—*Editor Forest and Stream:*—I was out to-day with my eight month old puppies, Nan, by San Roy ex Drane's Cora (Mark—Jennie) and Lock, by San Roy ex Queen Bess (Gladstone—Donna J.) after the quail (or partridges, if you prefer). In a bunch of sedge Nan dropped to a point, and I knocked down one with my right and missed with my left barrel. She was steady to shot. Lock was ranging in another part of the sedge when the birds got up (which they did wildly), but I called him up and dropped him. The birds seemed to be scattered as only four got up. I put the puppies out again and Lock came to a point with Nan backing him beautifully. It was a single bird and hard to flush, but I finally kicked him up and grassed him. I tried to get Nan to retrieve the bird, but the puppies have had no education in this branch, and I was only partially successful after a quantity of coaxing. Lock soon made another point on a single bird, with Nan backing—both puppies dropping to point. Upon flushing this bird and shooting it, Nan showed some inclination to break in, but she dropped at the word and remained steady. The next point was made by Nan, with Lock as a backer. Both puppies dropped to shot, and I knocked the bird down but failed to find it. After sending the puppies out again, I heard a bird flush to my right and supposed it had been flushed by Lock who had gone in that direction. I found him dropped on a point. Possibly he had dropped to wing, but I saw that he thought there was a bird still there. Nan, coming up, backed him, and I flushed the bird and killed it. Another bird got up some little distance off when I fired, but I missed it, or at any rate failed to get it. Nan then made a beautiful point under an oak bush growing among the sedge, Lock backing staunchly, and this bird I also brought to bag. Several other points were made by the puppies, and in every instance they were perfectly staunch on back and point, never failed to drop to wing or shot, and showed no inclination to break shot, except in the single instance already mentioned. Going on, Lock pointed a bevy in a stubble field and Nan promptly backed him. I could see the bird on the ground within three feet of Lock's nose, yet he showed no inclination to move. On flushing and firing, Nan dropped to shot—Lock had dropped to point—and both puppies remained perfectly staunch. These birds flew into the woods and flushed wild so that I got little shooting. I returned home at noon, having killed nine birds out of the two covey. These puppies have had very little handling and almost no experience. They were whelped on March 26 and March 30, 1885, respectively. They are quite fast and stylish and for their age are hard to beat. As they are not for sale, it may not be improper for me to say they are the best I ever saw.—AH-PE.

THE IRISH SETTER PRIZE.—Progress, N. C., Dec. 22.—*Editor Forest and Stream:* I have just seen an article headed "Irish Setters," wherein Mr. L. W. White, Secretary and Treasurer pro tem. of the Irish Setter Club, says: "Messrs. Hitchcock, Donner and Coster, judges at the Eastern Field Trials, on being requested by me to decide which Irish setter shown at the trials was entitled to the Irish setter special awarded by Mr. William Dunphy, of Peekskill, N. Y., and Dr. William Jarvis, of Claremont, N. H., concluded that it should be equally divided between Elcho, Jr., Blarney, Rose of Killarney and Glenclaire." Now, as I was one of the handlers of Irish dogs at that trial and the only one that won a heat, allow me to ask Mr. White through your paper a few questions about that special, as the gentleman who owned the dog I ran would like to know how it was decided; and as this is the first I have ever seen in any paper I was somewhat surprised at it. My first question to Mr. White is, Why, as Secretary and Treasurer of the Irish Setter Club, didn't he give the money put in his hands for that purpose to the Eastern Field Trials Club, so that they would have decided it on the field? He must have known that they would not decide it unless they had the prize to show, as they have given two or three cups which have never shown up, and they had to make a strict rule not to notice anything unless they had it in their hands. My second question is, How came he to give part of it to the Derby? as he publicly claimed the Derby had nothing to do with it, it being a prize given to encourage Irish setter men to run dogs and given after the Derby entries had closed. My last question to Mr. White—but not least—is, What business had Mr. J. O. Donner to decide the Irish setter special? If he was a judge of that class it is the first I ever knew of it, and how he was brought in to decide the Irish setter special and Mr. Wilson left out is more than I can see, and I would like Mr. White to tell me through this paper. It also looks very queer to me that Mr. Coster did not know anything about it, as I saw him a number of times after the trials and he said he believed they had decided it in some way, but did not seem to know anything about it. It looks to me as if Mr. White had put himself in a rather awkward position, and one which he should clear up as soon as possible, as I have talked with a number about it, and every one, like myself, seems to think the money belonged to Blarney or his owner, and when they divided it they were dividing that gentleman's money.—T. M. ALDRICH.

WHERE DOGS ABOUND.—Colorado is probably not so much cursed in this respect as some of the other States. But in some parts of Southern Missouri, for instance, or Northern Arkansaw, the wonder is as to how the country can sustain so many children and dogs and so little of anything else. If a stranger goes up to a cabin in Crawford or Maries county, Missouri, he stirs up enough dogs to supply a whole State like Delaware or Rhode Island. They are nearly all hounds, and they are of no account whatever. But the determination with which the owner of one of those dogs would protect him, illustrates the difficulty that would always attend the enforcement of a law for their extermination.—*Denver Tribune-Republican.*

"GRAPHIC'S ALLEGED FLUSH."—In the communication in last issue by Messrs. Anthony and Heath, page 452, section 10, for "We did not agree to Mr. Donner," read "We did agree to Mr. Donner."

JIMMIE.—Mr C. J. Peshall, of New York, writes us that the reported death of his pointer dog Jimmie from distemper was a mistake, and that he is alive and well.

BRACKET, the pointer mentioned in last week's issue, was bred by Mr. Leach, not by Mr. Norrish, as stated.

THE HARTFORD KENNEL CLUB'S DOG SHOW.—Hartford, Jan. 2.—*Editor Forest and Stream:* The Hartford Kennel Club claim April 14, 15 and 16, 1886, for their bench show. As far as possible we shall allow our exhibitors to choose their judges, and if any one wishing to exhibit will kindly favor us with first and second choice for their specialty it would confer a favor on HARTFORD KENNEL CLUB (per A. C. Collins).

AMERICAN ENGLISH BEAGLE CLUB.—It is proposed by a member to have the beagle judge appoint two members to assist him in the ring when judging, to have all the dogs scored openly by them. No doubt that plan would be most satisfactory to all parties. Of course the two members selected are not to have any dogs entered for competition. It is proposed to fix the initiation fee at $1 hereafter.

THE GRAPHIC KENNELS.—Messrs. Heath and Anthony announce that hereafter they will own together a kennel of dogs to be known as the Graphic Kennels.

KENNEL NOTES.

KENNEL NOTE BLANKS.—For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." All Kennel Notes must be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Freckles. By E. W. Jester, St. George's, Del., for black, white and tan beagle bitch, whelped Oct. 12, 1885, by Duce (Rattler—Sprightly) out of Juno (Ringwood—Mary).

RANGE AND GALLERY.

BOSTON, Jan. 2.—The attendance at the range at Walnut Hill today was larger than usual, and good weather conditions were had, with the exception of a 12 o'clock fish-tail wind, which gave some trouble. On the 12th inst., the annual meeting of the Massachusetts Rifle Association will be held at the Quincy House at 6 o'clock, and the annual dinner will be served at 7:30 P. M. Business of importance is to be transacted. The results of to day's shoot were:

THE CHAMPION MILITARY SHOT.—Major Andrew S. Burt, Eighth Infantry, who has a national reputation as a crack shot, and is now stationed at Fort Bidwell, Cal., has made the best individual score thus far reported during this season. The records show that he has made a perfect score (100) at each of the 200, 500, 600 and 800-yard ranges, 96 at the 300 yard, and 98 at the 1,000-yard range, making a total of 594 out of a possible 600, or 99 per cent. The total is slightly in excess of the score made last season at Fort Missoula, Mont., by Lieutenant M. C. Wilkinson, Third Infantry, who headed the list of sharpshooters with a percentage of 93.22.

MILITARY MAGAZINE ARMS.—Brigadier General S. V. Benet, Chief of Ordnance, has tabulated the company reports on the three magazine arms issued to the army, and under date of Dec. 15 transmits them to the Secretary of War. In his note of transmittal he says: "These guns—the Lee, Chaffee-Reece and Hotchkiss—were recommended for trial in the order named by a board of officers convened in 1881 under authority of law, and were distributed to the Army for the purpose by the Lieutenant General of the Army. The reports from 145 companies have been received, examined and tabulated. Comparing the three magazine guns with each other the reports are, for the Lee, 55; Chaffee-Reece, 14; Hotchkiss, 26. As magazine guns, therefore, the reports are largely in favor of the Lee. Comparing the magazine guns with each other and with the Springfield service rifle, as single loaders, the preference is for the Springfield, as follows: For the Lee, 5; Chaffee-Reece, 0; Hotchkiss, 1; Springfield, 21. Comparing the magazine guns and the Springfield for all uses the preference is: For the Lee, 10; Chaffee-Reece, 3; Hotchkiss, 4, and the Springfield, 48, being largely in favor of the Springfield. After a careful consideration of these reports I am satisfied that neither of these magazine guns should be adopted and substituted for the Springfield rifle as the arm for the service. I have been, and am, an advocate for a magazine gun, but it would seem the part of wisdom to postpone for the present any further efforts toward the adoption of a suitable magazine arm for the service. The Springfield rifle gives such general satisfaction to the Army that we can safely wait a reasonable time for further developments of magazine systems."

NEWARK, N. J., Jan. 1.—Rifle shooting in this city has suddenly taken a drop. During 1884 there were seven organizations in the field, and now only two that may be called permanent exist, namely, the Frelinghuysen and Essex clubs. The Celluloid Association disbanded in February last and shortly after the Domestic Rod and Rifle Club followed suit. The Washington, Plymouth and Western clubs disbanded in 1884, the members joining the remaining associations in the city. It has been extremely difficult to open a tournament, as little interest is manifested in gallery shooting, and not only this, but the majority of members—who are mostly mechanics and out of employment—find it difficult to retain their membership, as money is scarce. During the year 1884 the Newark Rifle Association, which comprises all the clubs in the city, numbered 470 members. Since that time it has dwindled down to about one third, and at a special meeting of the Association it was unanimously voted that the clubs discontinue their annual tournaments and confine all gallery shooting to their individual ranges; also, that the clubs entertain all challenges from outside associations. The Frelinghuysen Rifle Club, organized on May 16, 1879, consequently is the oldest in the city. The officers elected at the last annual meeting are: J. K. Walsh, President; John Rose, Vice-President; A. C. Neumann, Secretary and Treasurer; Rifle Inspector, S. H. Shackelford; Delegate to the N. R. A.—J. K. Walsh and A. C. Neumann. The Essex Rifle Club still continues at its range corner Lush and Bank, with at present 47 members. All communications to the Newark Rifle Association should be addressed to A. C. Neuman, 203 Mulberry street. The Newark clubs have shot only two matches outside since the defeat of the Zettlers, viz., Essex, of Newark; Washington, of New York.—A. C. N.

THE NEW YORK STATE ARM.—Adjt.-Gen. John G. Farnsworth, in his annual report, made during the past week to the Governor, speaks of the plan to supplant the present .50 caliber State model arm with the Springfield, as follows: "The arms of the Guard are in serviceable condition, but a change in the caliber of the Remington rifle in use to conform to that of the piece used by the United States Army becomes more apparent each year, and the recommendation of the Adjutant-General of the Army in his annual report, that a general act of Congress should be passed in the approaching session providing for immediate exchange of all obsolete arms in the hands of the militia of the several States for improved Springfield rifles, caliber .45, is a step in the right direction which I most heartily indorse. A bill to carry out this recommendation has been introduced in Congress, and I would respectfully suggest that action be taken by the Legislature to urge the Senators and Representatives from this State to use their efforts to further its passage."

SPRINGFIELD, MASS., Jan. 1.—The Rod and Gun Rifle Club had a fair attendance at their shoot at Lake Lookout to-day. The Massachusetts target was used and the scores made were very good, considering the unfavorable wind which blew throughout the afternoon. The scores:

E T Stephens	10	10	11	9	11	12	10	9	10	12—105
J Allen	11	11	11	9	11	9	12	11	9	10—104
H K Hindley	10	10	12	10	11	12	9	9	10	10—103
J Town	9	12	8	7	8	10	8	11	12	6— 91
E S Field	7	8	7	9	4	12	12	10	11	8— 88
Sterling	12	7	9	10	10	8	6	9	6	5— 77
J W Keyes	8	5	8	10	8	8	9	7	7	6— 76

ZETTLER RIFLE CLUB.—Dec. 29.—Regular Club shoot, ring target, possible 120, gallery 100ft. long: M. L. Riggs 114, D. Miller 111, M. Dorrler 112, M. B. Engel 114, A. Lober 113, G. Zimermann 111, H. Holges 110, L. Flach 108, C. W. Karcher 100.—N. D. WARD, Sec.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

SAN FRANCISCO, Dec. 20.—The habitues of Bird's Point were reinforced to-day by an influx of visitors, and the first match on the list was contested by sportsmen from various states and foreign countries. Mr. Grove, of Texas, took first, $40; W. L. Eyre took $25, second money, and Mr. McAlpine $15 as third on the list. Birds were good and strong on the wing, and some phenomenal shooting was the result. The outcome of the event was more or less a surprise to the betting fraternity, who made Mr. McAlpine a hot favorite. Following is the score:

Grove	1111111011—11	Philips	1011010111101—8
McAlpine	1110111011110— 9	Wilkins	1011110001001—7
Jones	0100111010111— 6	Carr	0001111101110—7
Eyre	1111101110111—10	Parrott	1110010011111—8

THE NEW JERSEY CHAMPIONSHIP.—B. S. Payne, of Jersey City, holds the New Jersey State champion badge, having won it at the last tournament, Sept. 19, killing all his birds, 15 straight. But by all odds the best and most reliable wing-shot of the State is John L. Brewer, commonly called Jack Brewer, of Hammondtown, Atlantic county.—ONE WHO KNOWS.

BOSTON, Dec. 30.—The pigeon shooters had possession of the range to-day and with good weather conditions had a fine day's sport. The scores ran: 1. Five birds—Curtis first. 2. Five birds—Adams and Curtis first. 3. Five straightaway birds—Nichols first. 4. Novelty Match—Curtis first. 5. Five birds—Lovejoy and Adams first. 6. Five birds—Robinson first. 7. Three pairs double—Snow first. 8. Five birds—Curtis and Adams first. 9. Five birds—Curtis and Lovejoy first. 10. Novelty match—Curtis first. 11. Five straightaway birds—Snow first. 12. Three pairs double—Robinson first. 13. Five birds—Snow and Lovejoy first. 14. Miss and out match—Curtis and Faulkner divided. 15. Miss and out match—Curtis, Faulkner and Adams divided. 16. Three pairs doubles—Faulkner and Robinson. 17. Five birds—Robinson first. 18. Five straightaways, 27yds.—Lovejoy first. 19. Five birds—Curtis first. 20. Five birds straightaway, 33yds.—Nichols first. 21. Team match, 5 birds from 5 traps—First team: Lovejoy 4, Adams 4, Snow 2, Allen 4, Slocum 3, Francis 2; total 19. Second team: Curtis 4, Faulkner 4, Nichols 1, Robinson 4, Hart 3, Draper 1; total 17.

WELLINGTON, Mass., Jan. 2.—The first shoot of the Wellington Gun Club for 1886 occurred to-day. The various events resulted as follows: 1. Five pigeons—Stanton and Bancroft first. 2. Five black birds—Bartlett, Williams and Crosby first. 3. Five pigeons—Sanborn first. 4. Five blackbirds—Sanborn first. 5. Five pigeons—Olys and Pond first. 6. Five blackbirds—Shumway, Swift and Bartlett first. 7. Five blackbirds, straightaway—Olys first. 8. Three pair pigeons—Snow, Shumway and Stanton first. 9. Three pair blackbirds—Bartlett first. 10. Five pigeons—Bartlett and Parker first. 11. Five blackbirds—Olys, Stanton and Bartlett first. 12. In the medal match the ties were shot off, resulting in Evans taking trophy No. 1, Buffum No. 2 and Wilson No. 3.

TORONTO, Dec. 30.—The continuation of the pigeon tournament at D. Beldam's, Malvern, commenced yesterday morning, the first item on the programme being the finish of the individual shoot, which brought out the fourth squad. This squad included the marksmen who did not shoot during the last day's meeting. Following is the score, 15 birds each, 29yds. rise, Toronto Gun Club rules:

J Jennings	001111100111101—10	Emo	001000 retired.
Hetherington	111001110111010—10	J Brown	1000011011 retired.
J Simpson	010111010000 retired.	J Bell	001011101101retir'd
R R Wilson	00000 retired.	D Beldam	110111001001111—10

This concluded the individual shoot. The first prize of $35 going to J. Townsend, second, $25, to C. Small, who killed all his birds; two of which unfortunately dropped dead out of bounds; third, $15, to J. Gould; fourth and fifth were divided between J. Wilson and J. Douglass; the sixth and seventh prizes were divided.

After lunch the team shoot commenced. It brought out representatives of four clubs. The Toronto Gun Club, No. 2 squad, killed 16 birds: Owl Gun Club, No. 2 squad, 15 birds; Toronto Gun Club, No. 1 squad, 22 birds; and Owl Gun Club, No. 1 squad, 21 birds. The Bingham Gun Club retired after shooting at five birds each. The Toronto Gun Club, No. 1, thus won the five gold medals, winning by one bird.

A match has been made between J. Bell and J. Townsend for $100 a side, at 50 pigeons each, the trial to be made on Jan. 29. A match has also been arranged between J. Wilson and D. Beldam, for $20 a side, at 10 double birds, to come off on the same date.

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest.*

NEWARK, N. J.—The wing shots hereabout are very busy just now and there are many enjoyable little meets. On New Year's Day the Norfolk Gun Club held a match on the South Orange road. The conditions were 9 birds each, 25yds. rise, one ground trap. The scores were: Dr. Kearney 9, Weigand, Meisel and Oschwald each 6, Doersbacher 2, and Maybuss 2.

In the match of the Vailsburg Gun Club on the same day, H. Hartenstein was declared winner with a score of 8 out of 10 birds at 21yds. rise. The other scores were: Reibold and C. Hartenstein each 7, Waag 6, McElroy 3.

On Jan. 2 A. J. Rust, of Philadelphia, and L. B. Campbell, of Little Silver, N. J., shot a pigeon match at Erb's grounds for $200, which resulted in a victory for the Jerseyman by three birds. The conditions of the match were: Thirty-five birds each, 25 yards rise, one barrel, find, trap and handle. James Van Brockel, of Matawan, was referee, and Frank Klintze, of Philadelphia, and D. Applegate judges. The attendance was the largest seen on a pigeon shooting ground in many years. The score is as follows:

Rust	1000111011011110011011011111100111100—21
Campbell	1101111111101001001111111110101001—24

After the match a number of sweepstakes were shot off, which were won by Mr. William Graham, of London, who has just come to this country to answer any challenge.

A CHALLENGE.—*Editor Forest and Stream:* We the undersigned would like to shoot a friendly match, at clay-pigeons, clay-birds, or any other target, against any two young men under twenty-one years of age, in or near New York. Answer through FOREST AND STREAM. We are both under twenty-one years of age.—S. AND L.

LOGAN'S MARKSMANSHIP.—General Logan is very fond of out door sports. He is an admirable horseman and swordsman, and knows how to handle a rifle. He is one of the best pistol-shots in the country. He has the handsomest dueling pistols in Washington. But he is the last man to brag of his strength or skill. When down at the Hot Springs of Arkansas a few years ago trying to throw off a peculiarly severe attack of rheumatism he astonished the pistol experts of that pistoling country. On one occasion a dozen of young men were practicing from the piazza of the General's hotel at a bottle laid on the broad crotch of a distant tree. The bottle was round. Unless it was hit plumply in the middle it spun round and round like a top. The young men were good shots, but now and then they would miss the somewhat difficult mark. Then the invalid Senator would chaff them. The young men finally became irritated and asked the General if he could improve upon their skill. After a little more chaffing the General said: "I'll tell you fellows what I will do. There are twelve of you, but I'll promise you each a box of cigars every time you hit the bottle if you'll promise me a box every time I hit it." The boys accepted the proposition instantly. "I'll shoot first, and, if I hit, I'm to shoot again until I miss." They had no objections, so the General fired twelve consecutive shots, each one breaking a different bottle, while the young men's eyes opened wider and wider. "Do you want any more?" he asked, after the twelfth shot. "No," said the young men, hastily, "I guess not." "You can send those twelve boxes to my room whenever you're ready, gentlemen," said the General, as he lounged away. "Some day when I have more leisure I'll give you an hour's instruction in target-shooting." But the boys never held him to his promise. They paid their bets, however, and did their practicing when the General was not around.—*Washington Correspondence Chicago News.*

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

PUBLISHER'S DEPARTMENT.

WM. S. KIMBALL & Co., the well-known proprietors of the Peerless Tobacco Works, at Rochester, N. Y., have brought out a "straight cut" cigarette which promises to win the popularity of the famous and standard "Vanity Fair," known, tried and approved for so many years. The Kimball "Old Gold" smoking tobacco is one of the choicest products ever put out by the Peerless Works, and its many excellent qualities will be appreciated by every smoker of taste and judgment who uses a pipe.

IT IS WORTH BINDING.—Gorham, Me., Dec. 29.—*Editor Forest and Stream:* I have been a subscriber of your paper since about 1878. I find it one of the best papers of the dozen which I take regularly. Having handled a rifle, gun and rod since my sixth year, I have appreciated the sere and gray time when failing eyesight warns me that my shooting days are most past. I still love to fish, and as well as ever I much enjoy your clean sheet. No need to caution my only daughter not to open your regularly welcome pages.—McL.

TO BE healthy and happy people, we have got to take care of our diet. What we eats and what we drinks should be the most important subject of a man's consideration; for, if his digestion is in good condition, his morals are the same. In America, people are in such a hurry to get their work done and their money made that they neglect their food, and when they have accumulated their fortunes they haven't the health to enjoy them. They have kept up their worshipping on stimulants, tea or coffee, that ruin the digestion and play the mischief with the liver, instead of drinking Baker's soothing and wholesome Breakfast Cocoa, which digests itself while it nourishes the body.—*Adv.*

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

THE SNEAKBOX FAMILY.

I.—THE BARNEGAT SNEAKBOX.

OF the many and various small craft found on the coast and inland watercourses of the United States, none possesses a more marked individuality or more peculiar features than the little boat commonly known as the Barnegat Sneakbox. Confined almost entirely to the locality where it originated, the long, narrow stretch of water cut off from the Atlantic by the low sand beaches of the east coast of New Jersey, it is chiefly remarkable for its difference from other American boats and its special adaptability to the purpose for which it is built. The sneakbox was first brought to general notice by the cruise made in one, in 1876, from Pittsburgh, Pa., to the Gulf of Mexico, by Mr. N. H. Bishop, and so well described by him in "Four Months in a Sneakbox," published by Lee & Shepard, Boston. At the time of Mr. Bishop's voyage but little cruising of this sort was done; but the wide growth of canoeing and the work of the American Canoe Association, of which he was the founder, have since attracted hundreds to this most fascinating sport, and has stimulated the improvement and development of all varieties of small craft that are suitable for cruising. Among the many craft of late appropriated by the wandering cruiser, the sneakbox has come in for a fair share of attention, and a great interest has been awakened in the hitherto little known and insignificant boat. There are many who will prefer a larger boat than a canoe, and there are many purposes for which the latter is safer and more comfortable. To say that a canoe is better than a sneakbox, or vice versa, is absurd; the two have each their special features which do not clash and which must be carefully weighed before a choice is made between them.

In this connection it is interesting to examine the reasons given by Mr. Bishop for his change from a canoe to the larger boat, which we quote by permission of Messrs. Lee & Shepard from "Four Months in a Sneakbox." "The sneakbox offered ample stowage capacity, while canoes built to hold one person were not large enough to carry the amount of baggage necessary for a voyage. A Nautilus or any improved type of canoe, would have been lighter and more easily transported, and could have been paddled at a higher speed with the same effort expended in rowing the heavier sneakbox, but the canoe did not offer the peculiar advantages of comfort and freedom of bodily motion possessed by its unique fellow craft. Experienced canoeists agree that a canoe of 14ft. in length, which weighs only 70lbs. if built of wood, bark, canvas or paper, when out of the water, and resting upon the ground, or even when bedded on some soft material, like grass or rushes, cannot support the sleeping weight of the canoeist for many successive nights, without becoming strained. Light indeed must be the weight and slender and elastic the form of the man who can sleep many nights comfortably in a 70lb. canoe without injuring it. Cedar canoes, after being subjected to such use for some time, generally become leaky; so to avoid this disaster, the canoeist, when threatened with wet weather, is forced to the disagreeable task of troubling some private householder for a shelter, or run the risk of injuring his boat by packing himself away in narrow coffin-like quarters and dreaming that he is a sardine, while his restless weight is every moment straining his delicate canoe, and visions of future leaks arise to disturb his tranquility.

"The one great advantage possessed by a canoe is its lightness. Canoeists dwell upon the importance of the light weight of their canoes, and the ease with which they can be carried. If the canoeist is to sleep in his delicate craft while making a long journey, she must be made much heavier than the perfected models now in use in this country, many of which are under 75 pounds weight. This additional weight is at once fatal to speed, and becomes burdensome when the canoeist is forced to carry his canoe upon his own shoulders over a portage. A sneakbox built to carry one person weighs about three times as much as a well-built cedar canoe." We quote Mr. Bishop's comparison at full length, as the argument has been advanced by others against the canoe. It must be considered, however, that his canoe was a 28lb. paper boat, and that all this was written ten years ago. To-day it is possible to obtain a canoe of medium weight that will give much more room for sleeping, a wide flat floor, and that will stand unlimited use under a heavy man without leakage, while the modern models have a stowage capacity equal to any requirements of one man. Mr. Bishop's route has since been traversed successfully by a 15ft. canoe. The sneakbox, while heavier, offers more room to move about, cook and sleep than a narrow canoe, and where sailing is the main object, especially in cold weather, and where land carriage and housing are not considered, she is superior to the canoe.

In this series of papers we shall describe first the ordinary sneakbox of the Barnegat baymen, then a modification of this shooting boat to the wants of the cruiser, named by its designer, Mr. Bishop, the "Barnegat Cruiser," and lastly a still more advanced stage of the development into a cruising and sailing boat built from designs specially prepared for the FOREST AND STREAM and which we propose to test with a view to its further improvement and adaptation to the wants of our readers. All of these plans will be accompanied by complete details and accurate tables of offsets, so that they may be used by any one to build from.

The sneakbox was originally a gunning boat, built and used for ducking on Barnegat Bay, and its history has been thoroughly studied by Mr. Bishop, and is given in his book as follows:

"Captain Hazelton Seaman, of West Creek village, New Jersey, a boat builder and an expert shooter of wildfowl, about the year 1836, conceived the idea of constructing for his own use a low-decked boat or gunning punt, in which, when its deck was covered with sedge, he could secrete himself from the wildfowl while gunning in Barnegat and Little Egg Harbor bays. It was important that the boat should be sufficiently light to enable a single sportsman to pull her from the water on the low points of the bay shores. During the winter months, when the great marshes were at times incrusted with snow, and the shallow creeks covered with ice, obstacles which must be crossed to reach the open waters of the Sound, it would be necessary to use her as a sled, to effect which end a pair of light oaken strips were screwed to the bottom of the sneakbox, when she could be easily pushed by the gunner, and the transportation of the oars, sail, blankets, guns, ammunition, and provisions (all of which stowed under the hatch and locked up as snugly as if in a strong chest) became a very simple matter. While secreted in his boat, on the watch for wildfowl, with his craft hidden by a covering of grass or sedge, the gunner could approach within shooting distance of a flock of unsuspicious ducks; and this being done in a sneaking manner—though Mr. Seaman named the result of his first effort the 'Devil's Coffin'—the baymen gave her the soubriquet of 'Sneakbox,' and this name she has retained to the present. Since Captain Seaman built his 'Devil's Coffin,' forty years ago, the model has been improved by various builders until it is believed that it has almost attained perfection. The boat has no sheer, and sits low in the water. This lack of sheer is supplied by a light canvas apron which is tacked to the deck, and presents, when stretched upward by a stick two feet in length, a convex surface to a head sea. The water which breaks upon the deck forward of the cockpit is turned off at the sides of the boat in almost the same manner as a snowplow clears a railroad track of snow. The apron also protects the head and shoulders of the rower from cold head winds. The first sneakbox built by Captain Seaman had a piece of canvas stretched upon an oaken hoop, so fastened to the deck that when a head sea struck the bow the hoop and canvas were forced upward so as to throw the water off its sides, thus effectually preventing its ingress into the hold of the craft. The improved apron originated with Mr. John Crammer, Jr., a short time after Captain Seaman built the first sneakbox. The second sneakbox was constructed by Mr. Crammer, and afterward Mr. Samuel Perine, an old and much-respected bayman of Barnegat, built the third one."

The accompanying design shows clearly the peculiar form of the boat. The lines were taken by Mr. J. H. Rushton from a 14ft. boat built by him, an enlargement of Mr. Bishop's original boat. This form of the boat is the best for gunning and sporting and the usual size is 12ft., the same as the Centennial Republic. The two scales given are for 12 and 14ft., while the following tables of offsets are for the same boats. In the first table the 12ft. boat is reduced in beam as well as in length, being 12ft. long and 43in. beam, instead of 14ft. x60in. If a larger boat is desired the offsets in the second table may be used, but the stations will be spaced closer together, thus the length, 12ft. or 144in., will be divided into 14 parts, or 10 5-16in. nearly. The lines of the boat are so peculiar that the stations are given at intervals of 1ft. only for greater accuracy in laying off. In building, the first step will be to enlarge the lines on the floor from the table of offsets selected, as described on page 21 of "Canoe and Boat Building." The stations or sections will be 1ft. apart, or for a boat 14ft. x 60in., as mentioned above, 10 5-16in. It will be noticed that the fractions given in the table are eighths of an inch, the denominator 8 being omitted, thus 1.5 signifies 1ft. 5in. and four-eighths or 1/2in

This form is used as the fractions are much more easily remembered than if halves, quarters and eighths were used together.

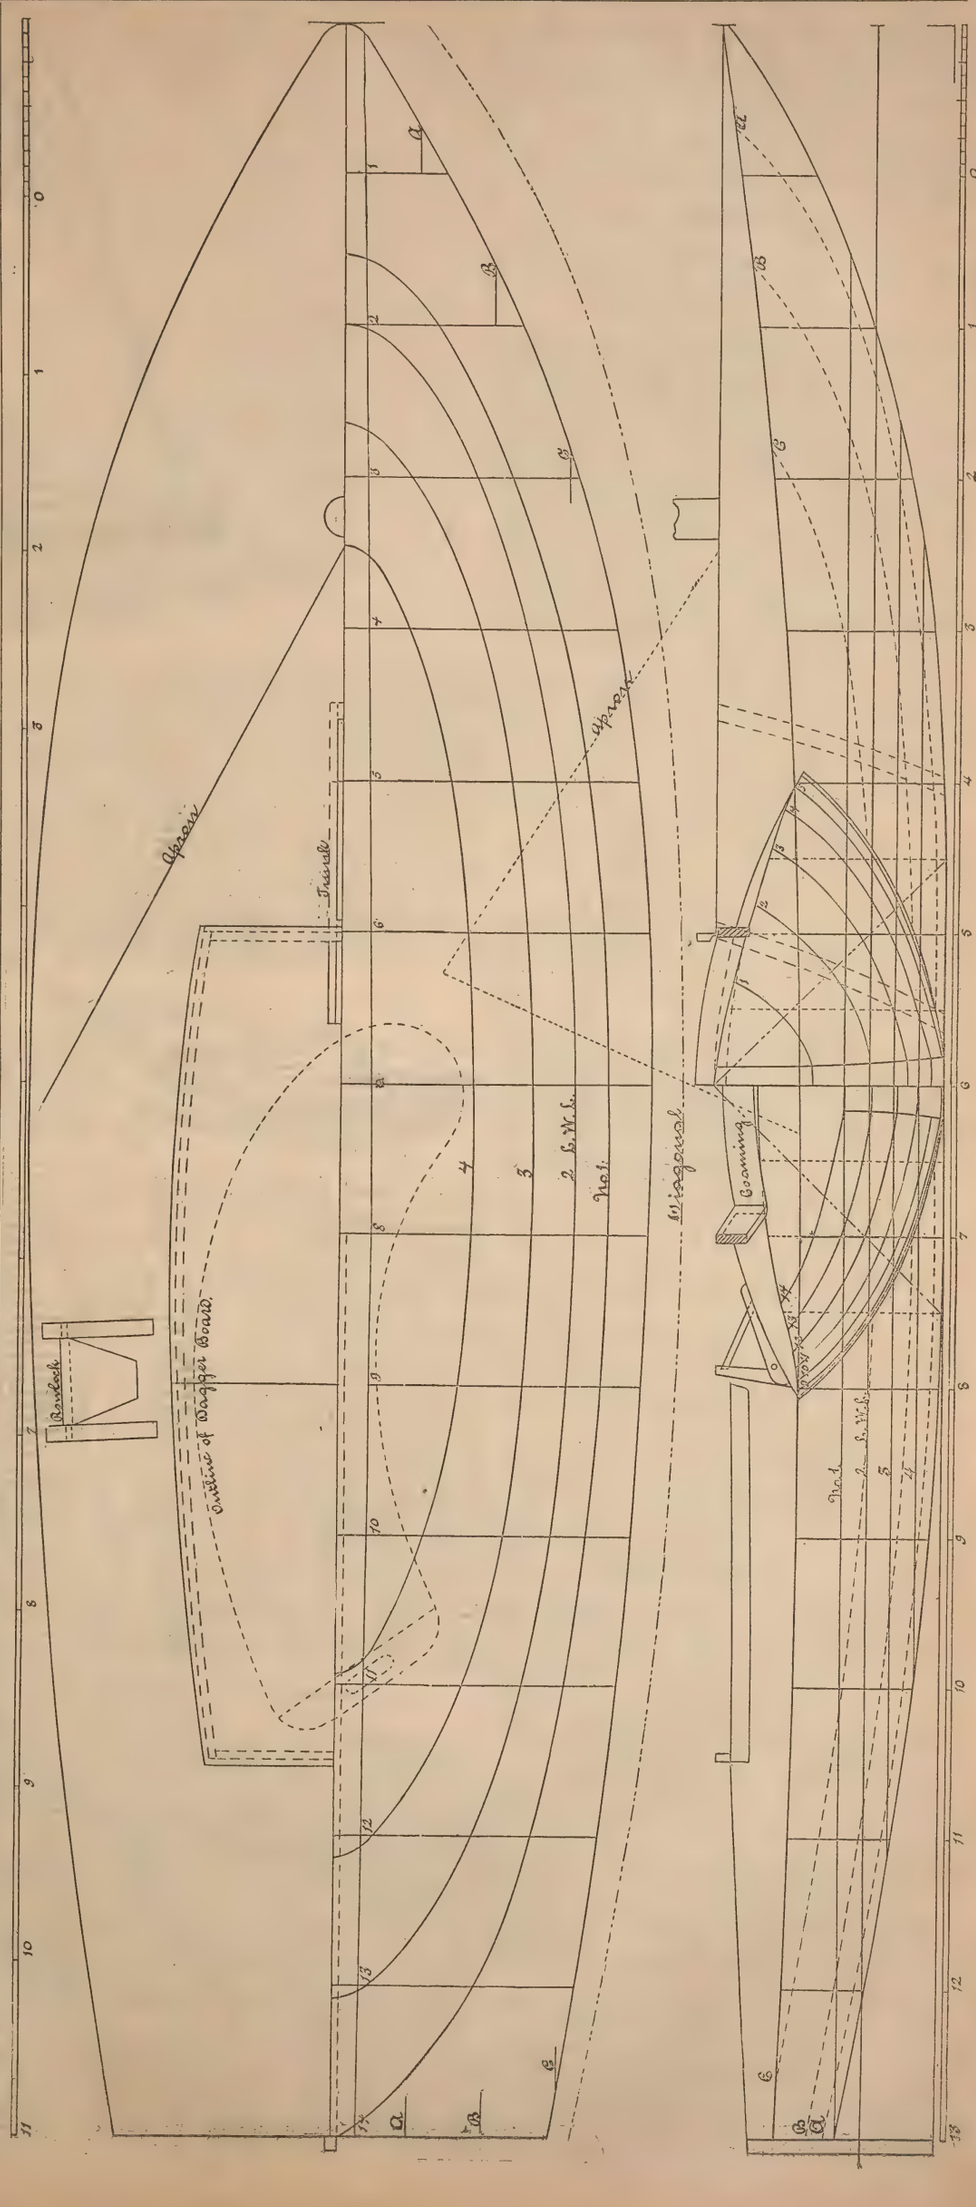
14	8	1 1	1 5⁴	0⁵	.....	.....	.....	2	1 0⁴



Note.—The fractions in this table are all eighths of an inch.

When the lines are laid down the stern piece or transom is marked off and three moulds are made—one at the midship section, No. 6 or 7, and the others between it and the ends. The keel is flat, usually 4 to 5in. wide and ½ to ⅝ thick, the half breadths in the design being given in the ninth column of the tables. The stocks must be built up at each end to represent the curve or rocker of the keel, column second of the tables; being straight amidship but rising at the ends. The keel is screwed down on the stocks, being wet with hot water, if necessary, to aid it in bending, and the transom is nailed to it at the after end. The centerboard and slot are left until the boat is planked. The three moulds are now fixed in place and firmly braced, after which three ribbands of some straight-grained wood, each about 1×¾in., are bent around on each side and screwed to the moulds, transom and fore end of keel, which latter takes the place of a stem. The oak timbers are next steamed, bent into their places and held by nails through the ribbands. The method of planking will be described next week in connection with the "Barnegat Cruiser."

The builders at Barnegat usually timber their boats with sawn frames of cedar, each 1¼in. square, spaced 1 foot apart; but we give the method with steamed timbers, as stronger and better. If sawn frames are used, each is laid off from the lines on the floor and two pieces are sawed—one for each side. These meet at the middle of the keel and are joined by a short floor. In the regular sneakbox the cockpit is narrow and rectangular, and may be completely closed by two hatches. The coaming has a small bead around the outside, at the top, and the sides of the hatches have similar beads around the inside, at the bottom. Each half-hatch is slipped on from the end, and the beads engage each other so that the hatches cannot be lifted off, but must be slid back. A padlock and hasp holds them together.

The centerboard is one of the most peculiar features of the craft. It is of the form termed "dagger board," somewhat like a scimeter, and is not pivoted but simply slides up and down in a narrow case, being lifted out entirely and laid on the floor when not in use. Its form is shown by the dotted lines in the drawing, it being there represented, for economy of space, as lying on the floor in the cockpit. This board is simple, and throws the center of effort aft instead of forward, as with the pivoted board, thus allowing the trunk to be well in the bow and out of the way. With the stem so much cut away and the board so far forward, the balance of the boat is badly distributed, and must be partly remedied by the sail plan if the boat is to handle fairly well, both with and without board. The consideration of sailing trim would place the board much further aft, but it would encroach too much on the space required for sleeping, etc., so a compromise, as shown, is necessary. The boat is sometimes sculled with one oar, and in sailing the oar is used for steering, but a rudder is usually preferred for the latter purpose. The usual form of rowlock is shown in the design. Two cleats of oak are screwed to the deck about 6in. apart. Each has a ⅝in. hole bored near the outer end in which an oak crosspiece turns. To this crosspiece a block is screwed in which is the socket for the rowlock. This block may be folded down on deck or swung up and held in position by a wooden brace.

Partly to compensate for the low freeboard and partly as a convenient stowage place for oars, guns, decoys, etc., a washboard 4 or 5in. high is built entirely around the gunwale and stern, as will be shown in the Barnegat Cruiser. This washboard is sometimes fixed and sometimes movable at will, and some boats it only incloses the stern and after half, from the rowlocks aft. The outline of the apron is shown in the drawing. It is of canvas, tacked to the deck, and may be propped up with a small stick. The usual rig of the gunning box is a small sprit sail, that on Mr. Bishop's boat being 7ft. 8in. on foot, 6ft. 6in. on luff, 4ft. on head, and 9ft. 2in. on leach. Of late the balance lug has been used with success on sneakboxes, and we shall give plans in connection with the other boats, as this sail is a very convenient one. In 1879 a 16ft. box was built by J. Kilpatrick, of Barnegat, for sailing only. This boat, the Snark, and her successor, the Bojum, have been used on Long Island Sound ever since for

pleasure sailing. Other boats of the same type have been built and used in various parts of the country for the same purpose. The plain sneakbox, built by baymen at idle times, may sometimes be had as low as $25, but a well built craft, completely fitted, will cost from $85 to $125. Among the leading builders are J. H. Rushton, of Canton, N. Y., who has made a specialty of finely finished sneakboxes, and J. D. Gifford, of Toms River, who is building for Mr. Bishop the improved form, which we shall illustrate next week.

BROOKLYN C. C.—The first annual dinner of the Brooklyn C. C. will be held on Jan. 12, at 6 P. M., at the Clarendon, Brooklyn.

Yachting.

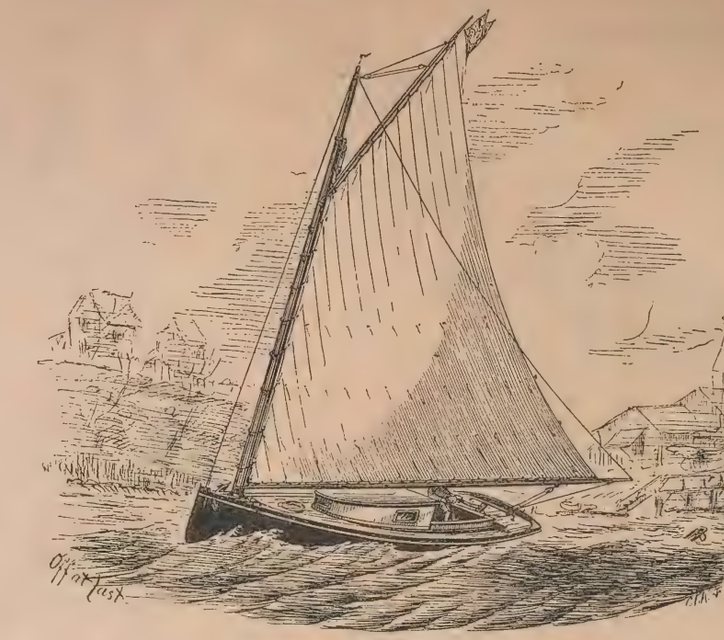
Address all communications to the Forest and Stream Publishing Co.

CRUISE OF THE COOT.

VII.

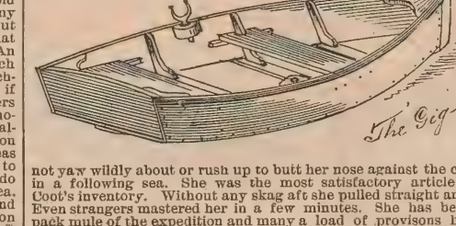
WHAT the feelings of the guiding masters in the pilot houses of the ferryboats were, as they peered through the morning mist and beheld the yellow-topped catboat still within hail, I cannot say. Probably they had no good will toward the little plague which had harassed them so much the previous day, with another dose in prospect. We soon shook company, for the tide was on the ebb and the wind from the west, much to the joy and relief of the solitary inhabitant of the Coot. The atmosphere was warm, the day bright and the waters smooth. A timely start quickly carried us beyond the familiar scenes of the day before. A bold rush sent us through the bridge, and then a long and short leg lifted the yacht around Diamond Reef and Governor's Island into the open bay. Here the wind had enough southing to lay a straight course for the Kills, passing over the shoals inside of Robbin's Reef. Great vessels lay majestically ahead and on both sides, structures of Titan strength and towering above the sea like massive castles in comparison with the diminutive Coot, a mere fly to such elephants. While she rose and fell to a long swell and tossed about her boom in ceaseless toil with the skipper intent upon keeping a course, the fleet of merchant vessels wholly ignored the commotion there was in the bay, and stately, steadily floated oblivious to the turmoil the Coot was passing through. To the rail of an imposing square-rigger crowded the crew to watch the little cat drive by. A hail from the mate in deep basso tones, "Rather cold to be out for a sail," brought forth the reply: "Ay, ay: bound to Florida." Again from the square rigger: "In that thing? Well, by ——!"

Those words, as if by magic, suddenly shifted the scene and per force thrust before my mental gaze the reverse of the pleasing picture conjured up with the life and brightness of the new born day. Like a cold chill down the back, it brought on a shudder and the spiritual barometer took a sudden drop clear down into the bulb. "In that thing?" So the Coot, my cherished little ship, was to other eyes only a thing! And my venture to a professional the spleen of a crank! Was it possible that I had been dreaming rosy air castles until the mere persistence in those dreams had led me astray from stern reality into a realm of impracticable myth? Should I stop to reconsider? Was I running on to ignominious failure, perhaps even to destruction? If the boat should not survive, would I? Would I care to? Could I trust my senses in anything at all, if in this, my particular sphere, all experience, all induction was to fail, and I to find myself floating helplessly about upon the hazards of flighty fancy? Had the cruise proposed been built upon the sands of reckless chance, and not as I had flattered myself, upon the firm rock of life-long experience and close observation scarce attained by any one else.



The roseate hue had dimmed and sombre thoughts now crowded to the fore. The voyage was a long, long one, true. But mere length constitutes no danger. It was to be in unknown waters, with all the risks of strange navigation. But then I had charts, a compass, binoculars, the remnant of a lead line and oh! a centerboard to furnish all the desired information on the spot as to the whereabouts of rocks and shoals, mudflats and gravelly bars. Surely there was no more trouble to expect in hitting a good, hard obstacle one thousand miles from home than in hitting it right before your garden gate. But hold a bit, the perplexity now begins. What sort of boat had I under my feet? Through the rivers she might serve well enough, but how about the broad reaches of the lower Delaware, and worse than that, what was I to meet in the wide sea-like waters of the great Chesapeake? An ocean in itself, for any small boat and a sea 225 miles long, which "easily bothers the biggest of ships," as a condoling friend had vouchsafed before my departure. A vast stretch of salty expanse, which if "inland" by courtesy, could display its wrath in storm-capped rollers nevertheless, against whose rude assault with tons upon tons of momentum, the little Coot would collapse like flimsy paper, to be swallowed at a gulp without a vestige left to tell the tale of destruction ashore. It was enough to keep her right-side-up-with-care with Boreas in mood benign, but if that ruthless fellow should open the bellows to full blast and back the Coot on a lee shore, what then was I to do alone in a little trap which could not be forced to face a steep sea, but would chop off and bounce away to the lee with her model and rig wholly unadapted to cope with adverse gales and wave upon wave crashing over the bow? To this the answer came slow and not over assuring. Slink alongshore in short spurts with a harbor within reach. Take no desperate chances in the wish to make long runs for display. Study the charts well beforehand and scheme out a plan of operations with the wind from each of the four quarters. Leave a loophole astern for which you can cut and run under the peak of the mainsail should it come to the worst, and for the rest trust to luck, for bad as such advice may be, something had to be left to the little cherub up aloft in the cruise of the Coot singlehanded. Once we make Norfolk in good shape, the most serious portion of the work will have been overcome, for though Pamlico below is broad open water, in places three times the width of Long Island Sound, its length is only half that of the Chesapeake and much of it is too shoal to nurse very high seas. Beyond that I cared not to look. Regions further south were so far away that they rose not upon my horizon till a later stage in the cruise.

That I could live, eat, sleep, work and be merry on board the little Coot was settled the first day to my satisfaction. If plain, her quarters were at least cozy and fully supplied with all I could want for pastime or study. Life would be more than bare existence. It would be enjoyable and profitable to body and mind to the extent I cared to contribute to those ends.



One cause of sore trial and tribulation of dire discomfiture which near wound up the Coot and her sailer at the start. I had not and scarcely could have foreseen. It never entered into my reckoning. Yet so far it has proven the most dangerous foe I have had to grapple. The Coot bears the scars of the terrible war waged upon her sleek sides by cutting, rasping, grinding, crunching, punching ice. Ice solid, ice in floes, ice in chunks, ice in slivers, ice stacked four feet deep, ice swept up and down each tide, ice driven by the wind, ice grounded hard and fast, ice thrown at the Coot in a sea, salt-water ice and fresh-water ice, ice in the river and ice in the canal, ice which threatened our destruction and caused my heart to sink in despair; ice which froze me out and nearly starved me out too, ice which I cordially detest and hate as an arch enemy to me and my boat, cunning, coarse, hard of heart, brutal and cowardly withal. Ugh! Now that I am below the belt of permanent cold, villanous ice! out upon you, let me kick you a farewell in contempt! Foiled in your dastardly attempt, we are beyond your devilish embrace, neer to enter the limits of your chilling domain again, till warm Sol pours down his stinging ray next spring, before which you will quail and dissolve, unhonored, unsung.

The difficulties of the cruise, I knew, would be aggravated by my being alone. There would be no such thing as relief at the stick, no warm lunches sent up from below, and often no lunches at all. There would be no one to cast the boat in getting under way while I catted the anchor, nor to fetch articles from the cabin as they were wanted. No one to suggest or approve, nor extra eyes to ferret out marks along shore. No one to keep the boat under control while tying down a reef, nor help in hauling out earings. All the work, all the wear, the management of affairs and every detail would devolve upon one pair of hands and one head instead of upon two or more. Risk and responsibility could not be lightened by being divided. I would have to face the music and dance to any tune it might play. But this was of my own choice. I knew from other similar cruises that to thoroughly enjoy the sweets of victory wrung from the elements in open battle, the challenge must be fought in individual capacity, without division of honors at the end of the day.

Thus the Coot drove along, till the passing cloud of dismay gradually cleared and the proposed exploit once more assumed the garb of downright reality. Closing in upon Constable Hook, a sharp line of rips indicated the edge of the ebb flowing out of the Kills. No sooner had this been crossed than the wind fell flat and drew out ahead in fitful catspaws. Through these the Coot was tacked back and forth, and when, by working eddies close in along the petroleum docks, she managed to beat a clumsy lighter bound the same way, the first victory for the Coot under the new *régime*, spirits had risen again to their wonted top notch and the mate aboard the square-rigger had been dropped and forgotten. Several boards weathered the Sailors' Snug Harbor and then a close haul slowly took the Coot along to her destined anchorage off Mr. W. P. Stephens's nautical headquarters at West Brighton, on the Staten Island side of the river. Here we rounded to, stowed mainsail and awaited events. They were soon forthcoming in the shape of a yawlboat with Mr. S. at the oars, and in company we pulled for the shore for the rest of the day.

On the island I cast about for a small boat to take along. A voyage without a tender could not be thought of. Nothing fitting coming under notice, it was determined to have a skiff built without delay. Fortunately Messrs. McWhirter & Son, recently from Erith, near London, England, had established themselves in Stephens's shop, ready for anything that might come along. As builders of all sort of craft they had a varied and rich experience which stood me in good stead. Three days of calm weather set in so that nothing was lost by the delay. The way these two craftsmen set to work and the deft manner in which they handled their tools was a pleasure to behold. A few words of explanation as what was wanted and both hove smartly ahead at the job contrary to prevailing notions that English mechanics are slow to comprehend and execute. In two days the skiff was completed and painted, a light, sightly and serviceable tender in every respect. Having put her to severe trial I can indorse the model and construction as superior to the usual run of skiffs attached to small vessels. She was light as a feather, rode the heaviest seas like a bird, was a stiff and buoyant carrier, and above all the easiest boat to tow I have ever seen. She would scarcely tauten the painter, and did

not yaw wildly about or rush up to butt her nose against the counter in a following sea. She was the most satisfactory article in the Coot's inventory. Without any skag aft she pulled straight and true. Even strangers mastered her in a few minutes. She has been the pack mule of the expedition and many a load of provisons has she ferried alongside in good shape. I do no hesitate to put off in her in any weather, small as she is. Her length over all is 7ft. 8in., beam across top 3ft., and 2ft. 6in. across the floor, giving 3in. flare to each side. The bottom has a slight camber forward and but little aft, the sternboard being immersed when pulling. This, with round lines forward, preserves large area of floor and accounts for some of her good points. At the stem she is 12½in. deep, amidships 11½, and the sternboard is 12in., with slight rake. The siding was run through the mill to ⅜-in. scant, and the bottom boards to ½-in. scant. Total cost, with 6ft. spruce oars and rowlocks, was $15. She was fastened with brass screws. As soon as the Coot looks into that eagerly sought "warm weather," diagrams to scale will be forwarded to FOREST AND STREAM. Wherever we went the skiff was an object of interest and many a sly jest. To the juvenile world she was a perfect delight, and more than one red-cheeked shaver thought the height of his ambition in life would be reached should he be able some day to possess her counterpart. Under way the skiff was always in tow. In harbor she was hauled across the counter, ready to slip overboard as wanted. A stop was rove through a hole in the thwart each side, by which the oars were hitched to prevent getting adrift. This little precaution was taken after losing one pair during a gale. Rowlocks were secured by short lanyards. The portability of the skiff was a strong recommendation. Upon landing in Philadelphia she was carried up street half a block and turned bottom upward within the welcome portals of a coal yard, where she rested in safety from the contaminating touch of outside barbarians likely to overlook her delicate constitution and waive strict proprietary rights. I consider her preferable to collapsable boats of any kind. She excels them in stability, durability and capacity for service and is ready in an emergency. With her astern I felt as independent as a lord, for I could come and go as I pleased in "my gig," and even tender her with a generous flourish to less fortunate acquaintances found knocking about without such useful appendage.

C. P. K.

THE CRUISE OF THE PILGRIM.—II.

BY DR. W. H. WINSLOW.

IT is only twenty-five miles from Cape Ann to Portsmouth Light, and a small yacht can run it in four or five hours; but there are great possibilities of wind and storm in five hours, and it is not comfortable to reflect that there is not a harbor of refuge to leeward after leaving Andrew's Point that a stranger can run into safely in an easterly gale without a pilot, and only one or two with; and who would find a pilot out in the bight in an easterly? If I were caught out there I should run to Portsmouth or Rockport, even though I had to beat to windward, and not trust myself anywhere near the shifting, treacherous sands of the coast from Halibut Point to Whale's Back. And here a cutter would save her crew while a shallow skimmer would go ashore; and, because one is liable to be caught in just such a pinch some time, it is, in my opinion, necessary that all small cruisers should be very strong, narrow, iron-keeled boats. I shall tell after a while what a scrape we got into and got out of safely.

We had a fine run across the bight, made the Isles of Shoals and Little Boar's Head, and kept closer inshore to avoid the sea and the heavy puffs which came off every few minutes and buried our lee rail several inches. We passed the yacht Echo, going south, and hoisted our club signal and the yacht ensign; but the two sleepy fellows aboard evidently did not understand sea etiquette and did not change their lounging attitudes. It was well we carried on during the squalls, because the wind died out toward sunset and we barely got inside Portsmouth Light at 6 P. M.

The mouth of the Piscataqua is wide and roomy, and it is easy to enter after dark because of the two excellent lights and the simple courses to run. One should have a good wind on full ebb tide, as this is augmented by the river current and is very strong.

Where to anchor was the question after we passed Portsmouth Light—we supposed Portsmouth; and sailed on against an ebb tide, the wind having freshened somewhat. Buoys were passed upon either hand and we felt quite confident. We went around Full and-be-damned Point, upon the left bank, struck a frightful current and eddy, the rudder and sails ceased to act and the Pilgrim turned completely around upon her heel and was almost swept upon the rocks. Frank, my yachtsman assistant, tried to steer and became pale and demoralized. We headed toward the other bank and then reached by the profane point and made way slowly through a tumult of waves and mimic maelstroms in trembling apprehension of another whirligig; but arrived near a beacon, and, as there were no vessels in the river in front of the city, we kept to starboard and anchored close up to the Navy Yard, where we knew there was shelter from the river current below an island. The yard had two hulks and a tugboat at the docks; the houses below it were windowless and deserted; there was only a gruff shipkeeper ashore who forbade our landing and said we would probably get our anchor caught in the large ship's moorings around us. The river raged between us and the city we wished to visit, where a few vessels were seen tied up to the wharves, and we saw that we must trust only to an anchor in the broad expanse of rushing waters, and that the anchorage for the city was really down river.

I must confess that I felt homesick when I looked around upon desolation and danger, and the prospect of spending Sunday near the vacant piers and the great ghostly ship house, and this was not lessened by the conclusion that we would be obliged to do without fresh milk and bread, and the pleasant run ashore. So when Frank said, "Let's go down river again while we can," I concluded to have the danger of going down river over before we slept, that we might have restful slumber, and to seek a more hospitable and peaceful anchorage. The anchor was raised by willing hands and the dangerous point was passed safely by following the example and the shouts of a boatman, and we reached a broad, shallow cove in the right bank, a little distance above Cod Rock and in front of New Castle village, and anchored by lead in three fathoms, about 8 P. M.

Two boys started immediately upon a foraging expedition, and returned in an hour with milk, bread and pies; the delicious Java, fried flitch and hot beans were ready, and we had such a supper upon deck at 9 P. M. as makes my mouth water even now. Then we elders smoked and talked, while the boys grew sleepy. Frank said, "I would not have stayed up in that hole over Sunday for a hundred dollars. It is the meanest place I was ever in, and I wish never to see it again." I agreed somewhat with him, and we all turned in, happy that the wind was low, the water quiet, and the little Pilgrim sheltered by jutting points from the wild currents.

Sunday, our first aboard, was a beautiful day, and we exposed all the clothes and bed-clothes upon the deck to the breeze and sun for hours, and gave the cabin a good cleaning and airing. I took three boys and went up the river on the flood tide about ten o'clock, inspected the Kittery navy yard from the boat, had a little walk in Kittery Foreside and in Portsmouth, and returned upon the ebb tide to the yacht at 4 o'clock. Then we had lunch and Frank and Bert took the boat and visited the shore and the ruins of Fort Constitution, and brought back several hermit crabs, mussels, whelks and curious pebbles and stones.

I always supposed the Kittery navy yard to be at Kittery, but the little village behind the yard is called Kittery Foreside, while Kittery proper is near the mouth of the river fronting on Pepperell's Cove. The banks of the river and its estuary are rocky, and the land rolls back in grassy hills, fringed and broken by lines and groves of trees. There are many pretty houses scattered over the landscape, and an immense summer hotel looms up across the cornfields to the south, located upon a little arm of the sea called Little Harbor. Kittery has several summer hotels and a very picturesque appearance and location, and New Castle, near the old fort opposite, is a primitive little settlement, having a fine outlook seaward. There is quite an area of water from the bridge above Portsmouth to the outer buoys of the river, and the shores furnish sufficient fine scenery and points of interest to make it a pleasant cruising ground for a small boat for one season. It would not take long to learn to take advantage of the currents and tides. One should always remember in going against the tide either way to give the profane point a wide berth.

I was up at 5 o'clock the next morning to take advantage of the tail end of the ebb tide, and shouted down the gangway, "All hands make sail!" then while the sleepy fellows were rubbing their eyes and getting into their clothes, I hoisted the mainsail and jib, got up the light anchor and catted it, and trimmed sheets to the light land breeze to the right bank of the river. The tide helped us by the fort and inner light, when the breeze freshened and we began to beat out in company with the cutter Iris, of Boston, which started out from Pepperell's Cove. She had her sails all set except the jibtopsail, yet we gave her a square race and beat her badly out to the outer buoy, where we turned north and she turned south. This gave us a good appetite for breakfast, and then we went bowling up the coast in a lively manner. It fell calm toward noon and we had barely crept up to Wells, when the wind came out northeast and threatening, and we headed for Kennebunkport, not being able to get up to the harbor near Cape Porpoise.

We steered in shore toward the hotels until it became a flat calm then we took the boat ahead and towed the little cutter to prevent her drifting toward Fishing Rocks, which are very dangerous, till a breeze sprung up and we could steer toward the obscure entrance. After passing a rocky promontory (Kennebunk Point) we could see the great Government piers, which are granite walls 40ft. high and 200ft. long, one upon each bank of the opening, to confine the river to a fixed channel and keep it deep enough for light draft navigation. When we were heading for the entrance between the piers, a very heavy squall came upon us off the land. The sea had floated us almost in line with the western pier, but the squall filled our sails upon the port side, and we were steering toward the eastern or right pier, when a boat with two men came alongside and one of them, a pilot, shouted, "Port your helm, quick! Give her sheet! You are almost ashore on the sand bar." The wind blew and the rain poured in torrents, but we sped from the danger and found good anchorage between the eastern pier and the point to wait for high tide. We were within ten feet of going ashore in a long, lazy sea, when the pilot spoke, and would have grounded between the piers had we attempted to run in then. The squall subsided into a drizzling rain, we rolled about outside two hours, and then the pilot took us in safely and tied us up to a wharf upon the left bank. It is safest to hug the right side and eastern pier till abreast of the outer head of the western pier, then run up the middle of the passage, and, after passing the piers, keep well over to the left bank (right hand) and tie up to the wharf.

It is impossible to lay at anchor in the channel; the tide rises and falls with great rapidity; the current has absolute control except at slack water; boats can not pull and vessels cannot sail against it, and one must tie up with all the rest or run up the river. It is a crooked, shallow river. The town is three-quarters of a mile up on the left bank, and pretty villas line the bank all along to the half dozen

hotels overlooking the sea. I thought the river and surroundings beautiful, but if there is any place where a 5 foot draft can lay and not ground at low tide, it must be a recent excavation. Yet, large vessels have been built here, launched and sailed out on high tide. At the wharf a half dozen sailboats, some fishing boats and one steamer were tied up. I counted a hundred small rowboats at the floats for the use of hotel guests. At slack water many go out to row, both ladies and gentlemen. I saw many ladies pulling single sculls, and saw better rowing done by them than I ever did by the sex anywhere. One lone canoeist paddled up and down in his birch bark, kneeling upon a buffalo robe, but he seemed not to attract attention, for which he was evidently aching. The parties were evidently all made up, and the girls preferred to paddle their own canoes.

The rugged hills and wild rocky coast, the masses of parti-colored herbage and extensive groves of evergreens; the grand outlook seaward from Cape Porpoise to Cape Neddick: the silvery river and pretty houses all along its banks; the fish-curing houses and flag-decked boats with their merry crews, united in making Kennebunkport one of the finest summer resorts upon the coast. There seemed a hilarity, heartiness and vigor in the visitors greatly in contrast to that of the other fashionable places, and one could not help but feel that the guests of the hotels came here for health and frolic, found the elements of both and used them. This was not paid for by courtesies shown. We paid cash for all we got; cooked our meals regularly aboard the Pilgrim, during the two days we were detained by the storm; answered all our visitors' questions courteously, and spent the time exploring the river, sauntering about the hotels and shores, visiting an Indian camp, and catching sea-perch, cod, hake and haddock. One old Indian upon the wharf had a special spite against sculpins and speared a great many daily. The larger fish were taken from trolls outside, and boats came in loaded every forenoon. They went out the second day of the N. E. gale and brought in plenty of fish. I heard the following conversation on the wharf:

"Bin out this mornin', Jim?"

"Yer."

"Did yer get a good catch?"

"Caught a few, lucky I saved my gear."

"What was the matter?"

"Matter? Rough out thar. Nobody but a fool 'd ever go out a mornin' like this ere."

The fellow had on oilskins and stood in his boat with a pitchfork, jabbing it into the fish, which nearly reached the thwarts of the craft, and pitching them into a tub upon the wharf. From this tub two men took them, cut off the heads, took out the insides, gave them a quick wash in a tub and pitched them into another tub upon the scales, where they were weighed. I was surprised to see many hooks and pieces of line in the fish, and the cleaners had to be careful not to get hooked. One told me the hooks cost so little they were not worth the trouble of cutting out. The bulk of the fish was haddock, the remainder hake and codfish. The cod were carefully laid aside for hotel use.

The morning of Aug. 26 was clear and cold and the wind was strong from the N.W. We put to sea about 10 o'clock, with many people looking at us from the hills and piers, and made a fine run under jib and mainsail past Cape Porpoise and Wood Island, across Saco Bay, in sight of Ferry, Old Orchard and Scarboro beaches, where the wind came in stormy squalls and buried our rail many a time in the sparkling, rushing waters, and we attracted the admiration of several Gloucester fishermen that had all the wind they could stand up under.

We passed Richmond Island before sunset, hoping the wind would die out after the sun went down; but it increased more and more, and hauled around N.N.W. just as old Sol sank and the lights of Cape Elizabeth shone upon our beam. There we met a short, choppy, ugly, English Channel sea that gave us trouble. We should have reefed, but the little yacht was pitching her bowsprit under every jump, the lee rail was awash all the time, and I was anxious to get fairly pointed toward Portland Head Light and past several buoys before darkness came.

The boys kept much below and seemed rather frightened, except Bert, who lay to windward of the cockpit and hung on to its seat. Frank had yachted as far as Portland before, and was my stand-by this perilous night, but even he seemed a little doubtful of our ability to get onward, and suggested we should run back under Richmond Island. I reflected that we did not know the anchorage or shelter there, could not reach there before dark, would probably roll and tumble without a warm supper all night, and might get blown out to sea; and then I shut my teeth hard, clutched the tiller firmer, said, "No, she shall go into Portland to-night or go to the bottom! We are all right as long as nothing breaks," and kept her on her course. Frank stiffened up as soon as I had decided, and took a position forward of the mast to clear the jib sheets, which sometimes caught in the cleats, and kept a good lookout. The little yacht pitched and plunged, dashed the seas aside, and dipped under them and darted over them, firmly eating her way to windward, apparently making no leeway, and not a rope yarn or bolt gave way. In the very worst seas one slopped up the windward side and over the house, rolling her deeply to leeward, and washed overboard thirty fathoms of spare riding rope that was in a Flemish coil and unlashed, at the same time wetting us pretty thoroughly, especially Bert, who remarked, "There's lots of fun yachting on the coast of Maine."

Frank hauled in the snarl with difficulty and lashed it upon the house, and we kept on, gradually working away from Cape Elizabeth on a N. E. course—for the wind had hauled to the north—past Trundy Reef and Witch Rock buoys until we passed, tacked and stood directly for Portland Head Light. As we got away from the land the sea was not so heavy, and we began to breathe easier and believe we might get inside. The lights were there to guide and cheer us, several vessels' lights and sails could be seen near Bangs' Island, and the boys came up and took more interest in things. We did wisely in standing off shore, as the wind drew along the land and the tide was flood against it, and we would have had rougher work closer in. Old sailors say "Cape Elizabeth is a nasty place to get past, and it is better to stand well out when one has a head wind."

The wind howled as we worked into the channel inside Portland Head, and we had sharp work in stays and to make out when we were getting near shore. The little cutter plunged into the seas and threw spray over us, and now and then buried herself a foot deep forward of the house, causing Frank to cling to the mast; but the water went right over the low rail, and we were only sprinkled in the cockpit. We heard the bell buoy of Bangs' Island tolling above the tumult just in time to go about, and then a smart little schooner passed us and led us up the channel. By watching her movements and tacking as nearly as possible in her wake, we were able to keep off the rocks; though when I looked at the chart afterward, and remembered how near the shore we often went, it seemed a miracle we had not knocked a hole in our pretty craft.

A vessel ahead as a guide is a very good thing, but one must remember that fishermen know every rock and every gap in a reef, and often run close to one and through the other, when a stranger in attempting to follow might be wrecked.

Our little craft went in stays and around like the crack of a whip, and I hardly had the helm alee before I was obliged to haul jib and trim down. She never missed stays, and I never saw a craft go around so quickly and reach so much. She turned no corners, but made a big curve as quick as a flash, all the time going to windward. It was comforting to see how she gained upon the lights of Portland, how little weather helm she took, and how nobly she battled with the sea and wind. Grit and Providence were on our side, and our spirits rose when we found the little boat was as good as a big one, and we passed some three-masted schooners bound in. All in the darkness, and hissing wind, and obstinate sea, without side-lights, in fear of being run down by outward bound craft, keeping a sharp lookout upon sails and seas and dark shadowy shores, we worked that twenty-five foot boat steadily and safely to windward, rounded the light upon the breakwater, and dropped our anchor in smooth water opposite the Portland Yacht Club house, at just 9 P. M.

Weren't we happy? Any one who has stormed a fort without a scratch, or been victorious in a college rush, knows how we felt. Then we found out something that made the shivers run down our backs. The little hatch on the port side forward was gone. There were two ½in. broken eyebolts and the lashings all right, but the hatch was not to be found, and Frank, who had been dancing around it did not know when it had disappeared. The water had been coming into the cook's quarters freely, but we supposed it was from a leak around the bitts; yet some must have gone down the hatchway. The hatch had probably been torn off by one of the ugly seas off Cape Elizabeth, and after that none had come in sufficient quantity and in just the right way to pour down the hole and drown us. That its loss was not discovered sooner shows what an earnest fight we had with the elements to get into port. Had we known of its loss, we should have turned back to Richmond Island—anywhere out of the nasty sea.

We made things snug, dined sumptuously off of hot canned turkey and tomatoes, fresh bread, and peaches, with the usual coffee, talked over our cigars awhile, hung up the anchor light upon the clew jig, and then slept the sweet sleep of tired yachtmen.

WINTER CRUISING ABROAD.—The following English yachts are at the present time cruising in foreign waters:—Fortuna, schooner, 366 tons, Mr. Adrian Hope; Australia, schooner, 212 tons, Hon. E. Dugmore; Diana, schooner, 77 tons, Captain Lyons; Marchesa, s.s., 377 tons, the Countess of Dudley; Rosalind, schooner, 98 tons, Hon. E. Dugmore; Maia, schooner, 118 tons, Captain J. Wilmore Smith; Mirage, schooner, 195 tons, Mr. A. H. Longman; Cambria, schooner, 193 tons, Mr. P. A. Rall; Sans Peur, s.s., 395 tons, the Duke of Sutherland; Siesta, schooner, 127 tons, Captain H. Turner; Lady Beatrice, s.s., 205 tons, Captain Townley Parker; Juno, s.s., 344 tons, Mr. Cross; Ada, yawl, 153 tons, Mr. W. A. Slater; Franziska, s.s., 201 tons, Mr. J. Wylie; Coralie, cutter, 40 tons; Lelie, s.s., 143 tons, Mr. W. F. Windsor; Cushie Doo, s.s., 358 tons, Mr. W. H. S. Osmond. Among the yachts flitting out and under orders for Southern voyages are the Elmina, schooner 344 tons, Sir Richard Sutton; Ariadne, schooner (*née* Boadicea), 380 tons, Mrs. Meynell Ingram; Ianira, schooner, 202 tons, Captain T. Hargreaves; Otterhound, yawl, 70 tons. The Ptarmigan, schooner, 176 tons, Mr. S. Gardner, has put back to repair damages sustained in a gale in the Bay, and the Maia, schooner, Captain Wilmore Smith, and Cushie Doo s.s., Mr. W. H. S. Osmond, have been spoken, homeward bound.—*Land and Water.*

THE BALL OF THE OSWEGO Y. C.—The social event of the winter in Oswego was the Yacht Club ball, held at the Armory, on Dec. 29. The bare and empty hall had been especially fitted up until its entire appearance was changed. The floor was covered with a dancing cloth, the ceiling was draped with red cloth, and the room was fully furnished. Near the door was the boat from the Lifesaving Station, from the roof were hung pennants and ensigns, while on each side of the entrance to the supper room, curtained off by flags, were the bright yacht guns. The attendance was very large and the entertainment was in every way a great success. The Committee were Messrs. R. S. Sloan, C. C. Norton, W. Gordon, J. F. Herrick, W. P. Judson and G. T. Clark. The Reception Committee were Commodore and Mrs. Phelps, Mr. and Mrs. Swits Conde, Mr. and Mrs. C. W. Pardee, and Mr. and Mrs. Sloan.

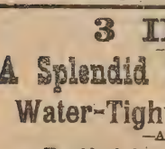
THE NEW BOSTON SLOOP.—Commodore Forbes denies the report circulated lately by a daily paper, that he intended to take Puritan abroad this year to race for the Brenton's Reef Cup. He will use her for racing and crusing this season. The contract for Gen. Paine's new sloop has been signed by Lawley and Son, and work will commence at once. The boat will be similar to Puritan, but 85ft. long with no more beam. The length over all will be 98ft., on waterline 85 ft., beam 22ft. 4in., depth of hold 9ft.; and draft 8ft., 4in. She will have the same amount of lead on keel as the Puritan, about 27 tons.

ANOTHER FLORIDA CRUISE.—On Dec. 22, the catboat Bonita, 25 ft. 6in. long, left Newport, R. I. with Captain Ned Long and a friend on board, bound for Florida. A third member of the crew is a black cocker, Black Bess. We hope to hear further from the cruisers as they work their way after the Coot.

GITANA.—This schooner is still at Fiske's Wharf, Boston, preparing for sea, and will sail about Jan. 15, for the West Indies.

YACHT STOVES.—Will "Piscator" send us a rough sketch of his stove as described in the FOREST AND STREAM of Dec. 17?

ANSWERS TO CORRESPONDENTS.



TWO JOHNS.—Please send address to this office.

S. D., Cazenovia, N. Y.—We will endeavor to obtain the lines you wish.

G. E. R., Flemington, N. J.—See note in Trap which answers your query.

D., New York.—Would advise you to get a purely-bred mastiff instead of a cross between a mastiff and St. Bernard.

J. S., Kingston.—You can put 1,000 or 1,200 pounds on keel with advantage. You will find the question of rig discussed in our files for the past year. In some waters the jib is better, in others the two headsails. You do not state where the boat is to be used.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

THE FOREST AND STREAM PUBLISHING COMPANY takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the eld of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.

XLV. A Single-Hand Yawl.
XLVI. Single-Hand Yawl—Cabin and Deck Plans.
XLVII. S. H. Yawl—Rig and Construction.
XLVIII. The Cutter Mamie.
XLIX. The Mamie—Midship Section.
L. The Mamie—Sail Plan.
LI. Six-Beam Cutter.
LII. Six-Beam Cutter—Sail Plan.
LIII. The Cutter Surf.
LIV. The Cutter Surf—Sail Plan.
LV. The Cutter Surf—Midship Section
LVI. The Cutter Surf—Cabin Plans.
LVII. The Cutter Spankadillo.
LVIII. The Cutter Madge.
LIX. The Madge—Ironwork.
LX. The Schooner Gaetina.
LXI. The Nonpareil Sharpie.
LXII. The Cynthia.
LXIII. The Cruising Sneakbox.

A folio volume (size of page 14½x12½ inches), printed on paper specially manufactured for it, and with great beauty of execution and finish in every detail, making a volume vastly superior to any other work of the kind ever published. Pages 370, with 136 plate pages additional, or a total of more than 500.

PRESS OPINIONS.

New York Times, Nov. 1.

The author, Mr. C. P. Kunhardt, is well known to all yachtsmen through his writings in behalf of better boats and a higher standard of skill while in charge of the yachting department of FOREST AND STREAM, and his hearty devotion to the sport, backed by a thorough scientific training, fit him peculiarly for the task he has so well accomplished. The conception of the work is a happy one; the subject is treated plainly and practically; fine spun theories and elaborated calculations are omitted, and only such results are given as will be useful to any intelligent yacht sailor or builder.

New York Evening Post, Oct. 24, 1885.

This book fills a blank in American yacht literature, and will be found a valuable addition to the libraries of our American yachtsmen. The subject matter, although covered in a measure by such works as Dixon Kemp's "Yacht Designing" and his "Yacht and Boat Sailing," is presented in more attractive form, is much condensed, and is procurable at less than half the cost of these volumes. It is practical throughout—practical in the treatment of what is popularly called theoretical. . . . We can recommend the book, notwithstanding its title, "Small Yachts," to all yachtsmen without reference to the size of their vessels, existing or in prospect.

Boston Herald, Oct. 4, 1885.

One of the best publications on small yachts that has came from the press for some years. . . . The volume as a whole commends itself to the yachtsmen or to the landsman who seek information on the subject of building, rigging, fitting out and sailing yachts.

American Canoeist, October, 1885.

To the man interested in boats—building, rig or sail—Kunhardt's book will be as interesting as a novel. It will not be read through once and then shelved, but will be kept in a convenient place for easy reference. It cannot get out of date.

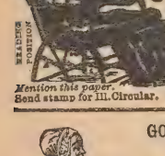
New York Commercial Advertiser, Oct. 6, 18 5.

This collection [the plates] is a concise history of yachting with small boats at the present time, and has a value which is not easily overestimated. . . . The many merits of the book will commend it to all who are interested in yachting and to all who want to be.

San Francisco News Letter, Dec. 5, 1885.

The largest, most complete and handsome volume upon small yachts shat we have seen. . . . The whole scope of yachting is ably handled.

The Germantown Telegraph.



It is beautiful in workmanship, abundantly illustrated and proves itself on every page the work of a writer thoroughly conversant with and enthusiastic about his subject. . . . It is to those who love yachting for its own sake and are intent to be their own masters that this work will appeal most successfully, for it shows how to build and run a small yacht, which will give all the sport one wants and make a true sailor of its owner.

New York Herald, Dec. 12, 1885.

There is a growing tendency among those who delight in "a whiff of the briny" to own a small and staunch cruiser, and to sail either single-handed or with a nautical shipmate. To those whose fancy lies in that direction, but who have not yet achieved their ambition, we cannot conceive of a better book than this of Mr. Kunhardt. There are numerous large plates and designs of every kind of boat, which can be recommended as reliable. There are sail plans and rigging plans, and there are also many shrewd suggestions and hints which the old seadog as well as the young tyro may read with advantage. The Forest and Stream Publishing Company issue the book in a style which does them great credit.

Now Ready. Price, postpaid, $7.00.

HILL ON THE DOG.

THE STANDARD WORK ON THEIR MANAGEMENT AND DISEASES.

Price $2.00.

For Sale by the Forest and Stream Pub. Co.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in 1885 we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM'S constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This in the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table. We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

GOOD THINGS IN STORE FOR 1886.

Among the papers and sketches to appear are the following:

Sam Lovel's Camps.

An account of Sam Lovel's experiences when he took Uncle Lisha's advice and went trapping on little Otter. By THE AUTHOR OF UNCLE LISHA'S SHOP.

To the Walled-in Lakes.

Sketches of exploration and hunting in the Northwest with the Blackfeet and Kootenays. By "Yo."

Cruise of the Coot.

An account of a voyage alone in a single-hander from New York along the Atlantic seaboard to Florida. By C. P. KUNHARDT.

Hunting in the Himalayas.

Scenes and incidents in the life of an Indian forester. By "SHIKAREE."

Falcons and Falconry.

An introduction to the sport of hawking, with illustrations, drawn from nature. By R. W. SEISS.

Game Preserving in Britain.

A comprehensive series of papers on practical game preserving in Great Britain, with descriptions of the game birds of the British Islands, and sketches of sport. By "MOORMAN."

Scrimshawing.

A popular account of how a whaler spends the idle hours aboard ship. By JAS. TEMPLETON BROWN.

The Lower Forms of Life.

A continuation of the admirable series of essays on the beginning of animal life. By JAMES STOLLER.

Studies in Botany.

New chapters on plants and plant life, written and illustrated from nature. By A. W. ROBERTS.

Land and Water Experience in Florida.

New chapters of experience on the Gulf Coast. By "NESSMUK."

Cruise of the Pilgrim.

A delightful description of a summer voyaging on the Atlantic in the cutter yacht Pilgrim. By W. H. WINSLOW.

Days with the Barmacide Club.

A vivacious account of angling luck, good and bad, in Adirondack waters, whose name, latitude and longitude the author refuses to disclose. By MILLARD

Camps of the Kingfishers.

A further relation of what befel the Kingfishers in their sojourn at Carp Lake, Michigan.

Camp Flotsam.

A new series of the chronicles of the outers at Camp Flotsam, with accounts of bass fishing in Canadian waters. By WAWAYANDA.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

ITHACA GUN CO., Ithaca, N. Y.

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞ Illustrated price lists sent upon application. Address

H. M. QUACKENBUSH, Manufacturer, Herkimer, N. Y., U. S. A.

NOTE.—We stamp our name plainly on each gun we make. Send for catalogue B.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.

LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JANUARY 14, 1886.

VOL. XXV.—No. 25. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

ANSWERS TO CORRESPONDENTS.

A NEW NATIVE TROUT.

IT is quite possible that those anglers who like novelty will have a chance to test the merits of a newly-discovered trout before long. At this late day, when our waters have been so thoroughly fished by intelligent anglers who send any strange catch that may fall to their lot to some competent ichthyologist to pass judgment upon it, it is strange that a new species of trout could have existed in New Hampshire without discovery. Doubtless thousands of them have been caught and dropped into the creel without further comment than an observation on their peculiar form or color, such as is often seen in trout from different waters, and without a suspicion that they might be a different species. Perhaps this state of things has been caused by the fact that anglers have become accustomed to a very great difference in the appearance of our brook trout, and have come to regard it as settled that there is but one species east of the Mississippi River.

At present the genus *Salvelinus* in America contains eleven species, according to Jordan and Gilbert; two of these are the lake trouts, *namaycush* and *sicowet*, if the latter is more than a variety; the "blueback" (*oquassa*), the *fontinalis*, the Dolly Varden (*malma*), and six Arctic species; and as our anglers have no particular need of a knowledge of the latter, like Dame Julianna, we "write the less of them." In fact, *fontinalis* and *namaycush* are the only two that they often come in contact with, the blueback being of such retiring habits and small size that it is not fished for in the deep waters it loves in summer, and only shows itself in October, when spawning. But a brand-new trout which so closely resembles *fontinalis* as to be mistaken for it is another thing, and appeals to the angler as well as the ichthyologist and excites his curiosity as to its habits, game qualities and table merits. It is an important event in the angling world.

Our attention was called to the fish by our correspondent Elliott B. Hodge, Esq., one of the Fish Commissioners of New Hampshire and the superintendent of the hatchery at Plymouth, in that State, who discovered the fish. Mr. Hodge came across a peculiar trout last fall in one of the New Hampshire lakes that he was confident he had never met before and sent specimens to the Museum of Comparative Zoology at Cambridge, Mass., where they were pronounced to be *fontinalis*. This did not satisfy Mr. Hodge and he sent a six-pound specimen to Dr. Tarleton H. Bean, the distinguished ichthyologist of the Smithsonian Institution, who after a casual inspection, found no difference in the fish from the common brook trout. Mr. Hodge then sent him another box of specimens, together with some of the latter fish from the lakes, and Dr. Bean went over them more carefully and wrote in answer: "There is no doubt whatever in regard to the trout, you were right and I was wrong." Dr. Bean says they are a *Salvelinus* of the *oquassa* type, but of such enormous size that at first he did not for a moment suspect their relation to that species. Prof. Baird thinks that it may prove to be one of the two or three species already described as found in Greenland or Labrador, and referred to above as Arctic species.

Mr. Hodge writes us that they are found in Sunapee Lake, where he saw them on the spawning beds last fall in large numbers, and "ranging from one to ten pounds in weight." They differ from the common brook trout in many ways: "In color, the females have a brownish back, sides lemon color; males, small ones, blueish-black back, large ones much lighter, in fact almost cream color, some a very light olive; sides a beautiful golden orange. They are the most brilliant colored of any fresh-water fish that I know. The fins are very large, much larger than the common trout, and the fish is entirely destitute of mottling on the back; in fact, there are none of the usual characteristic markings of brook trout." We presume, however, that Mr. Hodge found the red spots, as the *oquassa* has them, although small. Mr. Hodge has a few of the eggs of this fish, and kindly offers to send a few to Mr. Mather to hatch at Cold Spring Harbor.

While it is highly probable that, as Prof. Baird suggests, the species may not be new to science, still the habitat is, and Dr. Bean's diagnosis will be looked for with interest.

HYDROPHOBIA VERSUS DELIRIUM TREMENS.

BY some of the editors who are suffering from mad dog on the brain, great stress has been laid upon the alleged fact that a well-known dog dealer who professed not to believe in hydrophobia finally himself died of the disease. Is there any sufficient evidence to prove that he did not die of delirium tremens?

The physician's certificate of death would not be satisfactory evidence. Doctors sometimes allege that a death ensues from hydrophobia, when they perfectly well know it to be the result of delirium tremens. The false report is given out of pity for the drunkard's family, who would rather believe that the husband and father was killed by a mad dog's bite than that he drank himself to a horrible death. These are not random statements; were there any occasion to do so, we could give name, place and date of more than one instance to prove them.

The New York City Health Department records show that in the last sixteen years there have been reported forty deaths from hydrophobia. What is there to prove that of these a majority should not have been assigned to alcoholism?

It is perfectly proper to regard the feelings of the bereaved family, so far as this can be done within the bounds of truth; but it is not right to charge the work of the bar-room to the kennel, nor to make the dog bear the burden of the bottle.

The next time a physician wishes to conceal the true cause of a drunkard's death, instead of putting it to the score of hydrophobia let him for a change charge it to the gas burner and make it a case of asphyxiation.

DEATH OF "HOMO."

THE readers of this journal who have been for years familiar with the signature of "Homo," the pen name of Mr Chas. S. Westcott, of Philadelphia, Pa., will learn with regret of the death of that gentleman last Saturday, Jan. 9. He was fatally injured by a fall, Saturday morning, and was removed to the Homeopathic Hospital, where he died in the evening. His age was forty-two; he leaves a widow.

Mr. Westcott was widely known as a sportsman, and enjoyed the esteem of a very wide circle of friends. He was a contributor to the sportsman's press for many years, writing usually of game, a subject upon which he was at all times well informed. His reports of the movements of the birds, and his directions to desirable shooting grounds have been of great value to the readers of his "Philadelphia Notes." In the summer of 1876 Mr. Westcott imported the Laverack setters Pedigree and Magnet, and in 1877 he bought Fairy II., and bred from her the famous setter dog Thunder. On several occasions he served with much satisfaction at bench shows and field trials.

STOP ADIRONDACK MARKET-HUNTING.

THE law forbidding the hounding of deer in the North Woods has been given a short trial. Everything goes to show that the law is wise and salutary. It is sure to be beneficial just so far as it can be strictly enforced. The total abolition of hounding will be a blessing to the Adirondacks. The residents and guides may not unanimously and immediately recognize the wisdom of the law, but if fairly tested the new order of things will surely command their support.

Complaint is made that since the hounding law has gone into effect many still-hunters have flocked into the Adirondacks to kill deer for market. The number of these hunters has been grossly exaggerated, and the results of their campaign have been overestimated. This has been done for the purpose of misleading the public. The design is to make still-hunting appear more destructive than hounding. All sorts of foolish and absurd and false statements have been made to bolster up this notion. To any one who is at all familiar with the Adirondack country and the ways of the game there, these propositions and the alleged facts given to support them are alike ridiculous and fallacious.

But accepting the statement that there has been a great and destructive influx of still-hunters into the woods, who have killed great numbers of deer and shipped the meat to market, what is the remedy for it?

Put an end to market hunting. Forbid the shipment of game out of the county in which it is killed.

We can conceive of no possible objection to such a step. It is universally conceded that a deer will bring more revenue to the guide than it will to the market-hunter, ten, twenty and thirty times over. It is to the same degree more valuable as an object of pursuit to the sportsman than as food to the consumers of the venison.

Adirondack guides and hotel keepers and all others who depend so largely upon the sportsman's patronage, will be benefitted by the abolition of market-hunting.

Has not the time come when such a law should be added for the better protection of deer?

MAINE MALCONTENTS.

THE malcontents in Maine who are never tired of growling about the non-export game law of that State, are principally of the Jonathan Darling stripe, that is to say men who have for years waged a war of extermination against the game, killing it on land or in the water as they had opportunity. It is a hard tax on patience to see these men pose as moralists and profess to criticise the present law solely because they think it a burden to the public. The true ground of their objection is that they can no longer send to the Boston market the deer they have clubbed to death in Maine waters. Their constant howling about the injustice and oppression of the game law will have about as much weight as the soughing of the wind in the treetops. They have only their own selfish ends in view: they want the market opened so that they can go to deer clubbing again; and this is just what they will not get.

In game protective methods Maine is an example for other States. A very instructive parallel may be traced between the course of events in Maine and in New York with respect to the attitude of sportsmen, guides and residents toward the deer and the measures taken for their conservation. When the non-hounding law was proposed for Maine it was met by the same opposition afterward encountered by the measure in New York. But in spite of the railings and threatenings of the professional game butchers and others who thought that the law meant ruin, the measure was passed, the dogs were banished, and the marketing of game prohibited.

MINNESOTA FISH AND GAME.

WAGONLOADS of netted fish are carted away from Big Sauk Lake, and the local press is urging that somebody wake up and enforce the law before the lake has been depopulated of fish. The Sauk Centre *Tribune* suggests with much pertinency that "it is nonsense to stand around and talk. The thing needed is to clap the law on to the men who wilfully do contrary to the statutes provided for such things."

The fish netters of Stearns county are not behind the Todd county deer slaughterers, who haul their loads of venison to market before the season opens. The situation should stir up the residents of that locality, but it is pretty safe to venture the prediction that the law's restraints will not seriously interfere with the deer hunters' pursuit. Minnesota venison will find its way to Chicago, St. Louis, New York and Boston as long as any deer are left to be hunted.

BIRD DESTRUCTION.

THE slaughter of our small birds still continues to be appalling. Every day in the year, from Jan. 1 to Dec. 31, somewhere within the boundaries of our country, men are shooting the beautiful white and gray sea fowl, whose graceful forms used to beautify our shores and our larger inland waters, and our singing birds, the destroyers of noxious insects.

When is this to end? What remedy shall be devised to put a period to this destruction, which is so repugnant to every lover of nature, and is such a serious injury to our agricultural interests? Thoughtless people, who believe that it is possible to reform abuses by act of Legislature, say that there ought to be a law against this bird murder. We have laws against it now, but they are regarded by no one. To make them more stringent would only be to bring further contempt upon our statutes. A law is useful only when it has the support of popular sentiment, and up to the present time the number of people who care about the slaughter of our small birds is very limited.

The only way to change the present state of affairs is to educate the people. Many years ago, while yet the buffalo blackened the plains of the West, we tried to convince the public that measures must be taken to protect them or they would soon become extinct. Time passed. The buffalo were a long way off. Nobody was much interested in the subject. Now the race is extirpated. As with the buffalo so with other large game, though extinction will not follow so rapidly; so with our gulls, and terns, and herons, and even with our swallows and native sparrows, our orioles and thrushes. Nothing will be left alive.

Along the Long Island shore the seafowl are no longer found. Slaughtered without intermission during their stay with us, their nests plundered when they attempted to breed, the few survivors of the multitudinous host that once gave life to the dancing waters and to the long brown sandbars, have disappeared. Some few of them may have winged their way up or down the coast, seeking some spot where their ears should not be saluted by the roar of the shotgun; others adorn the hats of women, and we may recognize them in the streets of New York, of Chicago, of Memphis and of New Orleans.

Ah! if only the women would think a little; if they but realized the incalculable harm that they are doing; if they but reflected that for each plume and cunning head that adorns their apparel, a bright joyous life has gone out, and remembered how easy it is for any one of us to take life, but how impossible it is to give it—if they thought of all this—we believe that the fashion would change so quickly as to bring to bankruptcy those who make their living out of this traffic in bird skins.

It is natural to say that the ornament to be purchased is now dead, and cannot take its place among the creatures of our shores and our forests, and that the purchase of this single one can make no difference. A hundred thousand women reason in this way and it is easy to see how the demand keeps up and why the fashion continues.

It lies in the power of our women to change this barbarous fashion, and to save our small birds now remaining, from the gun of the bird butcher. Let them refuse to countenance the wearing of hat birds, and the slayer's occupation will be gone. Then when they shall have fostered a healthy public sentiment against the destruction, laws far more stringent than those we now have may be made and enforced. The first thing to be done is to create a healthy public sentiment which shall frown down the present absurd and brutal fashion. Further legislation will come later.

SAND, SAND, SAND.

FLORIDA rejoices in the possession of vast stretches of barren sand, which to the uninitiated eye appear utterly worthless. But there is money in them. They can be made to yield a profit by one of three ways. The first is to let them severely alone and put your capital somewhere else. A second is to spend a small fortune in fertilizers and wait ten years for returns. The third way, speediest, easiest and dead sure, is to divide the sand wastes up into "town lots" and sell them to Northern gulls. Great fortunes may be made and great fortunes are made in this way. A Florida sand paper town is worth more than a hole in the ground. The public after a while grows weary of sinking money in a mine; it never tires of buying "town lots" in Florida.

This sort of thing has been going on for a long time. Florida sand swindles are older than any other land swindles in this country. Paper towns were surveyed, plotted and sold away back when the peninsula belonged to Great Britain, and the thievery was engineered by London landsharks. In the old books of Florida travel you may find glowing descriptions of great towns that were to be, but never a pine was felled for the first settler. The sand swindles in those days were no meaner than they are now. Simple men and confiding women were no more eager to plant their savings in the pockets of the town promoters then than they are now. Florida sand wastes have never yielded more enormous profits than they are yielding now, and on the other hand the mortification, regret and hardships of the sand sharks' victims were never more poignant than in this year of grace 1886.

If a person contemplates investing in Florida real estate, the cheapest way is to purchase the plant of some one else who has put time, capital and hard work into a piece of ground and now wants to sell out for about a quarter of what he has spent. Florida is full of such people.

THE NEW YORK SYSTEM.

IN another column will be found abstracts of the annual reports of some of the New York State game protectors. They are not all so satisfactory as might be wished, but on the whole the statements of work undertaken and accomplished are encouraging. They show that New York is on the right track. The system is a good one. The lawless individuals who make a living by unlawful practices have not in every instance been brought to book; but in a large number of cases they have failed to elude the officers and have paid their fines. This never could have happened under the old order of things, when game law enforcement was the business of enthusiasts in general and nobody in particular.

The force now employed is inadequate to perform the work as it should be done. The number of protectors ought to be increased.

THE MAINE WOODS are unusually full of lumbermen this year, a large share being "Canucks;" and the crews go far back to remote localities where moose are said to be found. The slaughter in crusting time will be great. Many hides will be taken out in the spring by way of the back lanes and roads; and they will not all be hides of animals which have been used for food.

MR. ROBERT B. ROOSEVELT is not one of the despondent pessimists who croak that "the shooting is played out," and he is just wise enough to keep himself free to go for the birds whenever the flight is on; and it was presumably on that principle that Mr. Roosevelt last Monday declined an appointment as Assistant Treasurer of the United States at New York.

NEWSPAPER LYING.—President Cleveland recently delivered his mind on the subject of newspaper lying. We notice that some of the editors who are scurrying to the front to indorse his remarks are the very ones who last summer filled their columns with the rubbish about the President of the United States hounding deer in the Adirondacks.

IF THE DEER HUNTER who was out after unseasonable game on Jan. 1 in Northern New York had not been engaged in that unlawful pursuit he would not have compassed his own destruction; but as it was he was drowned.

THE MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION'S annual dinner will be held at the Parker House, Boston, Tuesday evening, Jan. 19. The secretary is Mr. Henry J. Thayer, 246 Washington street, Boston.

TO THE WALLED-IN LAKES.

VI.—STRONG POWER, SUN.

THE next day two Kootenays, one of them the man who had promised to come the day before, rode up to the camp and proposed to go hunting. No one seemed to care to go except myself, and so saddling Jerry, we were soon on the way toward the mountain which we had first climbed, the one on the west side of the upper lake.

As I rode along behind the Kootenays I rather wondered how I should communicate with them in case I should have anything special to say. One of them could talk Piegan, it is true, but my knowledge of that tongue was confined to about half a dozen words. A good deal could be said by signs, but I am not especially proficient in this language, and there is always a chance for a misunderstanding of the particular sign on which the sense of the whole communication depends.

We did not follow the trail taken by our party in previous climbs, but rode toward the shore of the upper lake and crossed the Inlet just below where it leaves that body of water. As we passed over the Inlet flat the Kootenay sang a little song to the Sun, in which he told that luminary, as I gathered from his gestures, that we were going to climb the great mountain before us, and there among the peaks kill plenty of sheep. He then made a prayer asking for good luck, and that our arms might be made strong and steady, so that we could shoot straight.

After crossing the Inlet we climbed the hills, not taking the trail, but making a new one, along which the Indians broke branches to mark it for future use. If I had been sure just where they were going, I should have taken them over to our trail; but I reasoned that they probably knew what they were about better than I did, and so I followed behind. When nearly at the edge of the timber line we crossed our trail, and on seeing it and the recent tracks which we had made, the Indians seemed surprised, and after speaking together, the older one turned in his saddle and asked me by signs if the trail had been made by us, to which I replied in the affirmative. Pushing on, we left our horses at the same point as on the two previous occasions when I had ascended the mountain, and started on over the rocks.

While we were preparing for the climb I endeavored to convey to the Indian the information that I was a poor climber and easily got out of breath and had to stop and rest, while he and his companion were strong and could go right on; so, I said, they must wait for me and go slowly. Whether he comprehended the polyglot mixture of talk and signs by which I endeavored to express my meaning I do not know, but I am sure that he did not act as if he did, for by the time I had reached the top of the first bench he and his comrade were far ahead of me, and were disappearing over the point of the mountain to the northwest. It is impossible for a man whose occupation for ten or eleven months of the year is sendentary, to start out and follow these mountain Indians over the rocks. I do not pretend to do it. I can scramble around pretty well after having been a few weeks in training, but when I am at my best I yield to a mountain Indian, and am content to follow him.

By the time that I had reached the point where they had disappeared, the Indians were nowhere to be seen, and I was unable to tell whether they had descended into the deep cañon, or gone around the point of the mountain on this side of it. Just then it began to blow and snow furiously, and I waited for the squall to pass over. While I did so a sheep snorted somewhere above me on the steep mountain wall, but though I strained my eyes in the effort to discover it, the snow was so thick and blinding that I could not make it out. After a while the snow ceased falling and I started on around the point of the mountain, but before I had gone very far, three shots sounded quite a long way up the cañon. The Indians had evidently found game.

I had gone perhaps a mile further and had stopped to listen and look, when suddenly I saw, three hundred yards ahead of me, two tiny points rise over a ridge and then a sheep's head. At the first warning I had sunk down beside the rock against which I was leaning, but not soon enough to escape the animal's keen eye. It stopped as soon as it had come in sight and for a moment or two we looked at each other. It had evidently been alarmed by the shooting up the cañon and did not care to go back, and so turning up the slope toward the wall of rock, it tried to run along by me on the upper side. Just as it started, another snow squall began, and for a moment the flakes flew so thickly that it was difficult to follow the animal's course. Twice it stopped to look, once at 200 yards and once at about 100 yards, and on each occasion I tried to shoot, but the snow was flying so that I could not see the foresight of my rifle. It ran swiftly by me and then stopped again, this time at about 150 yards; but, as bad luck would have it, directly behind a pile of rocks, over which I could just see the line of its back, and between two of which its head and neck were visible. I knew that it was now or never, for if it once got fairly by me, it would not stop again within shooting distance. So I drew a fine bead on the neck just below the head, and the old gun spoke out. In that wind there was no hanging of the smoke, and as I lowered the rifle and before the sound of the report could have reached it, I saw the animal give a wild bound and start at headlong speed down the mountain. I knew from these signs that I had hit it, but where? Possibly my ball had merely grazed the skin, but the creature acted as though hard hit.

I did not stand still and reason about the matter, but seeing that the sheep had taken a course which would at once carry it out of my sight, and that therefore there would be no opportunity for a second shot, I had thrown another cartridge into my rifle and dashed off for the point where the animal had disappeared over a ridge. Springing from rock to rock, I hurried along the mountain side, and was soon near the spot where I had last seen it. While yet some yards distant my eye caught the deeply-plowed imprints of the wide-spread hoofs, and as I cast a glance ahead down the slope, there was a patch of old snow, on which were two or three tiny dots of blood, confirming the story already told.

The trail was an easy one to take, for it led down over loose shale interspersed with rocks, and I followed it at a run down the mountain side. Once or twice when the animal had made a sudden turn I overran it, but a glance backward always gave it to me again.

There is something rather horrible in the wild and savage excitement that one feels under such circumstances as these; the mingling of exultation over the apparently successful pursuit, tempered by the doubt about securing the prey, and then the fierce delight, temporary of course, when the capture is assured. These feelings seem to be those which the wolf must have when he is pulling down the exhausted deer, or the hound when the tired fox pants along just ahead of him, and the fierce triumph of success is heard in his exultant mellow bay. It seems shocking that a respectable civilized and well-ordered being, such as a person of ordinary cultivation living in the nineteenth century may be supposed to be, should, under any circumstances, indulge in such brutal feelings. It shows how thin is the veneer of civilization which hides the brute in our nature and how easily this veneer is rubbed off, showing underneath it the character of the animal.

As I kept on down the mountain side, the blood on the trail became more abundant, and soon I felt sure that the sheep would be found within a short distance. A little further on there was a patch of low willows a foot or two in height, over which was a broad smear of blood as though some large object had been dragged across them, and looking beyond them and down over a ledge twelve or fifteen feet high I saw the game stretched on its side. It was quite dead.

The animal was a yearling ewe and was in very fair order. My ball had struck the neck about three inches below the

head and had cut the windpipe and the principal artery. On the whole the shot was a very lucky one.

Standing my rifle against a rock, I drew my knife and began the work of preparing the game for transportation to camp. While engaged at this a problem presented itself. How was I to get my meat to the horses? The distance was perhaps three miles, and the return necessitated a climb of 1,500 feet up the mountain side, a long journey over its rough face and then a descent of about 2,000 feet to the horses. The sheep would weigh dressed from 80 to 100 pounds. Now I am a little man, slight, and rather feeble than athletic, and usually find my own weight quite enough to carry, and I was perfectly well convinced that it was useless for me to think of getting this entire animal to the horses. As I continued my work, I kept hoping that the Indians would pass along within sight, so that I could call them down and induce them to pack the load for me, but they did not appear, and when I had turned the creature over to drain, I smoked and prepared to face my task unaided. If we had had any meat in camp, I would have taken the hams and saddles, which I could perhaps carry, but I did not like to leave the forequarters, for it was evident that as long as the bad weather lasted, one might go hunting a good many days without killing any meat.

Finally I thought I would see how far I could carry the animal, and so, with some difficulty, I threw it on my back, and with my rifle resting across the legs in front, started very slowly and tremulously up the mountain. It was a terribly hard ascent, bad enough when I had only myself and my gun to carry, and now weighed down by the load on my back, it seemed at first as if it would be impossible for me to go 100 yards. It was necessary to stop every few steps at first to take breath, for the weight on my shoulders made it seem impossible for me to fill my lungs with air; but at length I had made half the ascent, and then placing my burden on a high rock, I sat down and took a long rest and a refreshing smoke and started on again. Once, when going slowly along over the loose tipping rocks, I fell, and it seemed to me as if a dozen holes had been punched in my ribs and my legs and arms broken, but I was "getting mad" now, and shouldering my burden again pushed on. Four times during my journey I threw off my load and rested, but at length I reached the top of the long steep hill at the foot of which I could see the horses. I tossed the sheep down the hill, and as I turned to stretch and look back, saw appearing over the mountain point the two Indians, bowed down beneath their load of meat. It was not difficult to drag my load down the hill by a foreleg, and when the Indians reached the horses I had already been there some little time. When they threw off their loads I saw that between them they had only one animal, so that their loads were really lighter than mine had been.

While we were packing the meat on the horses the thought occurred to me that I would try the Chinook jargon on my friend the Kootenay, for this tribe ranges over into Oregon and British Columbia, where this barbarous tongue—if it can be so designated—is spoken, and to our mutual satisfaction we found that we could converse quite easily, though long disuse had made my vocabulary rather limited. As we started down the mountain the Indian again asked me about the trail, and whether it was a good one, and on my replying that it was much better than the one we had taken coming up, he asked me to go ahead and take them down by it. This I did, deriving as I rode along not a little of amusement from the fact that I was guiding the Kootenay Indians around through their own mountains.

That night in camp I told the story of the day to my companions, and after I had ended it Appekunny said: "That mountain shall be called Singleshot Mountain from this day forth, in memory of your single shot." And Yellowfish, who was stripping the fat meat from a sheep's rib, said, "It is good;" and then, turning to me, added: "Now the Bear-pipe will have a dance." "*Ah,*" I replied, "*skoon-a-taps nat-ose.*" (Yes; strong is the Sun). Yo.

Camp Fire Flickerings.

"That reminds me."

178.

SOME of your readers in Ogdensburg, N. Y., may perchance remember Mike Daniels, whose habitat some twenty-five years agone was in that burgh.

He was one of a party of hunters who made their camp one night on the Oswegatchie (locally known as the Oshegoshy), and had for his rifle a new wiping stick, in those days commonly called a "limber." This fitted the bore of the piece with great accuracy, and that night, before turning in, he chanced to leave it exposed to the weather. There was a slight shower and a mist that evening, and when Mike, who was an early riser, went forth at gray daybreak, and attempted to swab his rifle with the stick aforesaid, it refused to enter his gun, being swollen with the wet. Mike, not fully appreciating the situation, dropped gun and limber, bolted into the camp, gave the nearest man a kick in the ribs, and waving his hand in his own peculiar fashion, shouted, "Git up, git up,—got to leave this cursed place to-night." "Wha' for"? (sleepily) from the recumbent form: "Git up, I tell you, there's witchcraft here; the —— raffle (rifle)'s *shrunk* in the night." It was a long time before Mike heard the last of his shrunken rifle.

I was relating this incident the other evening to Josephus, who was half asleep, and he roused himself sufficiently to say that it was a good yarn, and added: "Had'nt you better send it to the Flickfire camperings?" KELPIE.

CAMP FLOTSAM.

XIX.—THE PIZEN ANN.

THE morning broke with a cold, battering rain and the thermometer at 60°. The camp fire had been drowned out during the night and everything within was in a state of dampness. The little camp stove, however, soon put the interior in living condition, and by noon the rain had ceased. With the first signs of a let up, we were in the boat and making our way around the foot of the island to try the fly once more. It was a solemn task, and we went over the weed beds and rocky bottoms across to Burnt Point, without the sign of a scale. Then we turned short to the left and skirted Pensel Island, with as promising a looking bass ground beneath us as one could wish, passed Devil's Oven and came into the open lake without having had a strike. The netter had done his work well. On the shoal behind Lost Spring Island, a calamity overtook a pound and a half small-mouth which became enamored of the dropper, and came into the boat after a smart fight. At Knapps Point we found the Colonel trolling over the shoal with no better luck than our own. Just beyond, at the extreme point of the shoal, we took a pound small-mouth and then pulled over to the bay in front of the tents and began the course anew. Here we had a fight with another small-mouth which took the Canada fly with a strike which savored of a five-pounder, made a long swirl of six feet or so, and struck for the bottom. We knew in a moment that we had a good fish, and a quick gesture caused George to put the boat broadside on in readiness for a fair fight. Up and down the length of the boat, in to the base of the rocks which lined the shore, across the stern to the edge of the weed bed, from entering which the whole leverage of the rod was barely more than enough to restrain him, the fish rushed not once, but half a dozen times, until the fear came with each turn that he would tear from the hook or escape by the parting of the snell. When at last he was lifted in, lo, a pound and ten ounces was all that the scales could be made to show. Never before had we seen a fish of like weight fight as this one fought, except that it never once broke water. A few rods further on, we took another of the same weight which made but a single rush or two and gave up the struggle, when we turned into camp with our four fish. Before we were through dinner another rain set in which furnished music for us until far into the night. The next day we tried still-fishing for the first. Hitherto we had used only the fly, and were quite willing to have an old-fashioned time with bait and bobber. Our bait was "chunk," the favorite of the Canuck, that is, pieces of perch with a pectoral or anal fin attached. We preferred small live perch, but these were hard to get, and on this particular morning none were on hand. A small perch was taken near shore with a fly, and with this for our entire stock of bait we started out. Anchoring between two rocks which rose from the water a couple of hundred feet apart, the choice cut of the bait—the "throat latch," as the natives call it—was put on the Madame's hook, while we tried the virtues of a Ferguson in casting. The first fish fell to our lot; then, after the Madame had taken two, seeing no signs of further luck with the fly, we joined in the "chunk." It was a pleasure to handle the little Mitchell, and when the first bite came there was a circus. In an hour, with three rods, we took eleven bass of two pounds average weight, the majority of which were big mouths.

The difference in the gameness of the two varieties was never more apparent. We marked each strike and the resultant fight with a care born of the desire to test the matter once again and to discover, if possible, in what respect we had done injustice to "the under dog" in the great bass controversy. We entered into the test doubtfully and humbly, for we were fresh from a "hetcheling" on the subject at the hands of the Cold Spring boss, and felt like the boy sent back to his seat to "try his sum over again." No, there was no mistake about it. Each would start off with about the same rush, but the fight of the big-mouth would be over in a couple of minutes. It was seldom that the small-mouth would make the leap that characterizes him in New York and New Jersey waters, while not a leap did we get from the other, but for a long, steady, stubborn under-water fight with tactics tending to an entanglement with the other lines, the anchor, or a stick on the bottom, the former was far ahead. And we will venture to re-assert what we said in an article of a year ago, that he who can see no difference in the gameness of the two varieties, has never seen the small-mouth in his perfection, and furthermore, we will agree with our friend of the Bigosh to name the variety after ten seconds play, under the conditions which he proposed to his friend Mosely on the James River, and not hedge, or we will give him a *carte blanche* order on William Mitchell for the best rod which that gentleman can devise. It occurs to us just here, to allude to a subject, mooted by us in the article referred to, and which was the cause of the aforesaid "hetcheling." We there said in substance, that it was our belief that the small-mouth was gamier in waters to which it was not a native. At the time of writing the article mentioned our observations, with this question in mind, had been limited to a single season. Beyond that, we could only recall and compare the difference between the transplanted and the native in memory. The experience of another season had left us somewhat in doubt, although we are inclined to coincide with the theory of Mr. A. N. Cheney in his paper upon that subject, suggested we believe by us, and read before the American Fisheries Society. Given the conditions of improved water and food, we are convinced that the gameness of the small-mouth, so far at least as the same is indicated by leaping, is increased by transplanting, but whether anything is added to the length, strength, cunning and dash of his under-water fight, of that we are in doubt; still it may be so. Perhaps there is no more appropriate place than this to answer the query put at us by our Bigosh friend, viz., "What effect does transplanting have on the under dog in this fight, the derided big-mouth?" Our answer must be, none that we have ever observed. We are not "after a rise" this time, and if our friend still insists on offering his scalp, we will pass the knife over to "A. N. C.," that the "raising" may be done in an artistic way.

In the afternoon, the camp indulged itself in a little piece of extravagance. The long stretches of water about us and the continuous winds had for some time suggested a sail boat of some sort, and we had seen a new cedar clinker built boat, rigged with mast and sail, at the outlet, and with which we had fallen in love. Negotations had been pending for a week toward her purchase, and on this day were closed and at 3 P. M. she bore down on the camp, lowered her sail and was formally delivered over to us, to have and to hold, to run on the rocks or capsize, just as we might manage her. She was christened right then and there, and before a week the Pizen Ann was known for miles up and down the lake and had carried her ensign into waters far from Loughborough.

That night we worked her to the outlet under sail, and got back with an ash breeze, but compensated for the toil of the latter by a sample of Cheney and oriole flies which came through the mail from our kind friend whose name the former bears. There had been a dearth of yellow in our fly-book, and an article in FOREST AND STREAM on the most killing fly had suggested an order for that color, but a mistake in filling it made by a New York house on the eve of our departure for camp, left us in the cold, and we had poured out our troubles to the veteran of Lake George, who promptly helped us out. We tried those flies faithfully and well, both in casting and trolling, and never had a strike on either; a sad commentary on the æsthetic taste of Canada bass. Nor did we find any one fly, unless we except the white Canada, which seemed more killing than another. The rule was, light flies for dark days and toward dusk, and dark ones for bright days. For the first we used the Canada, Professor or Ferguson, for the latter, the great king, Lord Baltimore and Montreal, with a scarlet ibis for either.

During our trip to the outlet, we found the native in all the excitement attending the berry fever, for various individuals had been "in the bush" and returned laden with pails of blackberries. A party of three or four were at the landing discussing a proposed expedition by water to a place in the woods, some twelve or fifteen miles distant, and we soon learned that it was near the border of Hart Lake, which water with Truthful James and Sabattis we attempted to reach last summer and failed at the lower outlet—eight miles from camp—for want of water in the stream which connects it with Loughborough. Here was our opportunity. There was now plenty of water, they said, and only one carry, but a bad one, to get over, and here were our guides to order and help for the carry. We wormed ourselves at once into the affections of that party and found that we would be welcome. We would probably be away from camp for two or three days, and a tent and supplies with a frying pan and coffee pot would come handy. The latter would only be needed by ourselves, for the Canuck drank tea, and strong at that. The arrangements were soon made and we were to hold ourselves in readiness to start at any moment within the next two days, when we should be notified that the party was ready.

Through the whole period of our last year's camp, we had longed to get into the chain of waters to the north. We had studied the map and it seemed as if the whole northern country was a series of lakes and streams. But we were told that with the exception of deer hunters in the fall, few ever visited them, and none of our proposals to make our way thither had met with any encouragement from the native. It was a half *terra incognita* to them, and the mosquitoes and like pests were a terror. As we were enjoying quite a season in our own camp with some of these, we flattered ourselves that we were skin-hardened, and so determined to make the venture and go as far as we could. There were miles of the lake about us which we had not explored, but we wanted new waters, and we got them.

It would be necessary to dispose of the Madame somewhere at the outlet or else leave her with the Indian girls and one of the boys to take care of the camp. She chose the latter, so the proposition was broached to the oldest girl, who was in a state of delight at the idea. But a single night passed in thinking of it, filled the head of the Madame with all sorts of imaginary scalpings, and in the morning she announced her intention of "going ashore." She might have been hurried to her conclusion by finding, upon awaking, one of the Indian boys standing in the tent, which he had entered without disturbing her and where he was waiting to find out when we would start.

In the course of the day word was sent us that the berry pickers would set out the next morning. A good sized boat which had seen its best days on the Rideau but which had a sail and centerboard and would carry eight persons, was being caulked and prepared for the journey. She bore the somewhat doubtful name of the Sabbath Breaker, and, should there be a sufficient breeze, the run to the lower outlet would be made in her, at which place she would be left and the trip finished in a couple of skiffs which were to be taken in tow. There was considerable good-natured chaffing between us and our Canadian friends, and we were warned that with anything of a wind the Pizen Ann and her crew would be left so far behind that they would have to get over the carry alone and find their way further as best they might. We were not over-confident in the qualities of our craft as a sailer, but we inwardly determined that, come what might, we would, by hook or crook, get to that carry in time to see the Breaker lower her sail, or that there would be a regatta, the like of which had never been heard of on the nether side of the border. In one respect, at least, we knew that we had the advantage, and that was in our sailing master, for George was an old tar and an expert with the sails. So we thundered back our defiance and struck out for camp with the prospect of a lively scrimmage before us on the morrow.

Once more the mosquitoes enveloped us on our way home and, without a breath of air stirring to aid us in the one-sided fight, we fanned and brushed until camp was reached and the smudge pail brought in and fired up. Then as the air grew thick and stifling, we rubbed on the killer, dropped on the bunk, and were soon dreaming of the ordeal awaiting us on the morrow, when we were to sustain the honor of America against the haughty subject of the woman who reigned by the grace of God. WAWAYANDA.

MICHIGAN'S SHIFTLESS LAW ENFORCEMENT.—Escanaba, Mich., Dec. 25.—*Editor Forest and Stream:* We read a good deal about killing game out of season. I do not believe any one has told one half of the true state of the case. It is terrible the way they are killing deer in and out of season, and shipping it out of the State in the legal killing time. I don't think shippers dare run the risk of shipping since one of the C. & N. W. Railway agents was fined $50 last winter for shipping out of season. I was told he could have been fined $1,000 if they had wanted to do so. One Al Moore (a Canadian) has for years been shipping trout in the winter as well as venison. This year our butchers bought all the saddles of venison they could get, and shipped them without any special care for the law. At one time I saw three small fawns (all spotted) in front of a butcher shop. The express company took all that was offered for shipment, without asking foolish questions so far as I can learn.—BLANK.

QUAIL IN CONFINEMENT.

WINTERING BIRDS.

A RECENT request from the editor for some notes under the above caption, and several inquiries from private correspondents constitute the "reason of being" for this article; hence no apologies. But the writer by no means intends to set himself up as an authority on the subject named, and the suggestions herein, drawn largely from his own experience, are tendered for what they may be worth.

It is safe to assume that in a majority of cases persons procuring live quail to winter, have come into possession of birds lately captured. These are forced to undergo a sudden and violent revolution in their habits, and in the hands of dealers are, for the time, huddled into cramped and insufficient quarters. It is not to be wondered at that, under the two causes combined, the quail suffer a most serious decimation, and contract ailments which a few weeks later break out in the most unaccountable way, to plague andgrieve the man who has fondly planned to stock a favorite shooting ground. It goes without saying then, that it is highly desirable to buy birds at first hands, and to obtain them as soon as possible after they have been taken. In this way the evils which arise from crowding large numbers of birds together may be reduced to a minimum, if not altogether avoided.

Having got our birds, where shall we put them? If at all practicable they should go outdoors, with the ground for the bottom of the inclosure. Outdoor air and ventilation are very greatly preferable to any arrangement possible indoors, and if we are to have strong, healthy birds to turn out in the spring, they need the tonic of the winter air. So far as temperature goes, it makes little difference how much (dry) cold the birds have to undergo, if they have shelter from the cold rains. It is difficult to freeze well-fed birds (unless they chance to be imprisoned by a sleet storm), but it is the coveys that have been gradually weakened and enfeebled by starvation that fall an easy prey to the cold and snows. My own coops (of which there are three) are four by sixteen feet each on the ground, and from two to four and a half feet in height—the sides and top inclosed by galvanized wire netting, with a portion of each roof tightly covered with boards so as to make a watertight shelter. The lowest coop has the entire top hinged with heavy strap hinges, so that it can be lifted and folded back for convenience in cleaning. All the coops are connected by apertures which close or open at will from the outside, and in this way it is easy to transfer the wildest birds from one coop to another whenever it is desirable to vacate either of them for any purpose.

The base of these coops is made by digging around the space to be inclosed a trench one foot in width and eighteen inches deep. In the bottom of this trench is packed six inches of tin clippings, the refuse from a tinshop, and upon it is placed a board a foot wide on edge, bringing the top of the latter level with the surface of the ground. On the upper edge of this board strips of tin are tacked, and a second board—also on edge—placed upon it. Now if the wire netting is carried up from a line an inch below the upper outside edge of the second board, you have a bottom for the walls of your coops which will defy all the rats or other vermin that may be in the neighborhood.

When I first built my coops I made the walls of heavy half-inch mesh and the tops of lighter netting with a mesh of an inch and a half. In building again I should make the roofs of mesh not larger than half an inch, solely for the purpose of keeping out the miserable thieving English sparrows. It is no exaggeration to say that last winter and this I have been obliged to feed six of these worthless tramps for every quail or other game bird in my coops. But all this will be stopped this week by the substitution of finer mesh for the tops.

It may be urged as an objection to the style of coop that I have described that they are too expensive. I am frank to say that mine are built for use all the year around. As to height, four and a half feet is none too high for convenience in entering and cleaning, and wild birds do not pound themselves so badly by flying against the top as they would by jumping against a lower roof.

Next as to food. Cracked Indian corn, buckwheat, German millet and rejected wheat and wheat screenings are valuable in the order named. The first two are especially desirable in cold weather. Of hemp seed the birds are very fond, and a little now and then is greatly relished, although it is too expensive to be used very freely. I was fortunate enough this winter to find a mill in Toledo where I can buy cracked corn delivered at my house at about fifty cents per bushel. Each kernel is broken into pieces about the size of a grain of wheat, and as a winter food for quail it would seem to be unequaled. At first I tried various forms of ground and cooked food, but came to the conclusion two years ago that for adult birds they are hardly ever desirable, and in some cases injurious. A little green food at occasional intervals is an excellent thing for quail in confinement—a leaf or two of lettuce, a leaf of cabbage chopped fine, or a bit of apple answers the purpose. During the summer and fall my birds generally got a little bunch of chickweed every day, and seemed to prefer it to all other green food. But they have very little food of this character during winter; it is scarcely necessary to furnish it more than two or three times a week (if so often) in captivity.

In mild weather the birds should have fresh water once a day, given in such a way as to prevent them from fouling it. But in severe weather, when water freezes as soon as put out into the open air, the quail seem to get on very well without it.

Perhaps, however, there is nothing quite so essential to the health of quail in confinement as plenty of coarse sand or fine gravel. It insures good digestion and per consequence healthy and vigorous birds in the spring. Ground bone, burned oyster shells and seashells (such as are sold for poultry by the barrel) come under the head of luxuries, which the birds can do very well without, though they are undoubtedly beneficial. A box of road dust in the driest corner of the coop I have found to be the best possible preventive against lice, and as road dust is not very plenty at this season, a supply of dry coal ashes furnishes a good substitute. Even the wild birds soon learn to use it and are extremely fond of rolling and scratching in it. Last but not least in this connection, two or three inches of wheat or oat straw, under the covered portions of the coop, make an excellent place for the birds to pick and scratch in, and a warm and comfortable bed at night.

There are a few diseases to which quail in confinement seem to be especially liable, and among these are cholera, roup and inflammation of the bowels. The first of these is the quail keeper's worst enemy, since it not only works sad ravages among birds fresh caught, but is apt to attack birds that have been caged for years, and partly domesticated. Readers of the FOREST AND STREAM will recall a case of the latter kind cited in these columns some time ago, and another has come under my own notice this fall. Cholera is evidently caused by overcrowding, bad ventilation and improper feeding, and when it breaks out in a coop of birds it is reasonably certain to finish the whole lot. I believe it to be highly contagious, and even though birds apparently well are separated from the affected ones, they soon succumb. Its approach is marked by a drowsiness, which soon passes into a heavy stupor, from which the bird can scarcely be aroused, and the disease runs through an entire covey in from two to five days. Perhaps some one has a better name than "cholera" for this disease. I can only say that in my experience it has proved sufficient for all practical purposes.

Roup and inflammation of the bowels are wet weather diseases and pertain more particularly to spring and fall and to young birds. Since wet is the principal cause of these difficulties, perhaps it is sufficient here to suggest that if due care be exercised to keep the birds dry no trouble need be occasioned in the winter time. But this leads me to say that if the editor does not enjoin me, I should like later to write a second paper on "Breeding Quail in Confinement."

Perhaps it may be pertinent to say in closing that I am not a dealer in birds and have none for sale, and that I never shot a quail in all my life, though I have been a hunter for twenty-five years. But my telephone has just rung up a message from the express office announcing the arrival of another box of live quail, and I must go to look after them.

JAY BEBE.

TOLEDO, O., Jan. 6.

ARIZONA QUAIL.

Editor Forest and Stream:

Mr. Herbert Brown's article in the last number of FOREST AND STREAM is a very welcome contribution to our knowledge respecting the habits and distribution of the different species of quail found in Arizona, embodying as it does information which has been eagerly and more or less impatiently awaited by the ornithologists of the United States. I do not think, however, that Mr. Brown has demonstrated the specific identity of *Colinus ridgwayi*, Brewst. and the pair of birds, sent by Mr. Brown to Mr. Grinnell, which I identified as *Ortyx* (now *Colinus*) *graysoni*, Lawr. To make the matter perfectly clear it will be necessary to review the history of the subject, somewhat as Mr. Brown has done.

In FOREST AND STREAM for March 6, 1884, was copied from the Tucson *Weekly Citizen* an article stating that *Ortyx virginianus* occurred in the Barboquivari range, Southern Arizona. This record I questioned in the following number of FOREST AND STREAM, basing my objection on the well-known geographical distribution of *O. virginianus*, the most western form of which (*O. virginianus texanus* Lawr.) "not having been traced further west than Central Texas," as stated in my note, which further explained that, "if not the Massena quail, the bird referred to must be one of the Mexican species of *Ortyx* (perhaps *O. graysoni*), none of which, however, have been taken on our side of the boundary line."

In the same note I stated that "in order to settle the question, it is very desirable that a specimen be sent for examination." Unfortunately, however, I added that "merely a wing, with a portion of the breast with the feathers attached, would be sufficient to insure identification," for it did not occur to me that there might exist in Arizona a species, as yet unknown to naturalists, so closely related to *O. graysoni* as to be distinguishable by the coloration of the head alone. Hence these tedious explanations.

It was not long, however, before Mr. Grinnell received from Mr. Brown, in response to my suggestion, fragments ("portions of wing, breast and tail") of a male, and the dissicated carcase (not "almost perfect skin") of a female, both rescued from the street, alley or vacant lot,[2] long after they had been thrown away. These imperfect specimens were sent me by Mr. Grinnell for inspection; and upon comparing them with examples of *O. graysoni* from Western Mexico, they were found to correspond exactly so far as they could be matched "part for part." Obviously, therefore, the only thing which could under the circumstances be done was to report to Mr. Grinnell, as I did, the result of the comparison. *O.* (or *C.*) *ridgwayi* was at that time an unknown species to naturalists. It is (scientifically) a more recent discovery, with which my identification of Mr. Brown's specimens could not possibly have anything to do.

It has been stated above that, the only obvious difference in plumage between *O. graysoni* and *O. ridgwayi* is in the coloration of the head in the adult male. The former has the throat and a bold, superciliary stripe, pure white; while the latter has the head entirely black. It should therefore be unnecessary to state that had Mr. Brown sent an entire specimen of the male there would have been no occasion for any mistake—granting that one has been made, which I cannot without further evidence concede.

In Southern Mexico are found in nearly if not quite the same districts two species of quails—*Colinus pectoralis* and *C. coyolcos*—wich exactly represent the more northern *C. graysoni* and *C. ridgwayi*, respectively, the former having the bold white head markings and the latter with the head entirely black, both likewise having the under parts uniform rufous or cinnamon. These two species are much smaller than their northern representatives, and differ from them in some other particulars. *Colinus graysoni* being a common species in the vicinity of Mazatlan, some 600 miles south of the United States boundary, and the intervening territory almost a complete *terra incognita* ornithologically, it is not at all impossible, or even improbable, that it should extend its range northward to across the border, just as several other Mexican species, previously observed no further north than Mazatlan—and some of them not nearly so far north—have been found to do.

In conclusion, I would state that much additional material, including specimens in better shape than those already examined, is necessary to determine the question of whether *C. graysoni* occurs in Arizona, and also that of its relation to *C. ridgwayi*[3]; and to assist observers who have not the opportunity or "knack" of making specimens, I give the following artificial key (based on the males alone, the females being practically undistinguishable from one another) of the species of *Colinus* found along our southwestern border, including the *C. graysoni:*

A. Lower parts whitish varied with bars and v-shaped marks of black....1. *C. virginianus texanus.*

B. Lower parts uniform rufous or cinnamon-color—

a. Head with the whole throat and a broad superciliary stripe pure white.....2. *C. graysoni.*

b. Head uniform black.....3. *C. ridgwayi.*

ROBERT RIDGWAY.

[1] This last statement of course refers to specimens taken by naturalists or professional collectors, and duly recorded in some publication.

[2] The exact circumstances of their recovery were stated in Mr. Brown's letter, but I have forgotten the details. These fragmentary specimens are still preserved in the collection of the U. S. National Museum, where they are numbered 96,763 and 96,764, respectively.

[3] There is a bare possibility that *C. coyolcos* and *C. pectoralis* may be individual color-phases of one species (*C. coyolcos*), and that *C. graysoni* and *C. ridgwayi* bear the same relation to one another. But this is merely a suspicion which I have been from time to time led to indulge by certain circumstances which it is not worth while to mention here.

A FLORIDA MUSEUM.

WALKING along the sea wall at St. Augustine the other day—or perhaps I should say river wall, for the people of the quaint old town insist on calling the beautiful sheet of salt water in front of the place a river—I caught sight of a little old display window full of curious things. It had an air different from that of the ordinary curiosity store, and I crossed over to it. A genial gentleman, Dr. J. Vedder, met me and talked to me about his wonders. Perhaps the most interesting of them all is his collection of Florida snakes, alive and exceedingly well caged for display. Chief among them is an enormous diamond rattlesnake. In the front room, stretched on a board, is the moulted skin of this monster. It measures seven feet and one inch in length and six inches wide, showing the living snake to be twelve inches in girth. If five inches be allowed for the rattles and something for the shrinking of the dried shell, his living snakeship cannot be much less than eight feet long. The Doctor tapped the case and the huge reptile threw himself into position to strike. The head was drawn back in splendid pose, and in the center of the swelling coils of his body the end of the tail was thrust up, the rattles quivering in rapid vibration and sending forth the ominous sound which has caused many a hunter to check his course through thicket or meadow. There was no longer any doubt in my mind as to how the rattlesnake produced his warning signal. The whole process was visible. If you go to St. Augustine it will be worth your while to see this process, though you may feel as I did—like standing back a little lest the snake should crash through the glass and reach you.

In another case were two chicken snakes. The Doctor put a live mouse into the den and both snakes started for it. One seized it and in an instant had wrapped it in his coil. A moment's struggle and the little rodent was dead. Cautiously the reddish brown folds loosened their grip, and then the mouse soon disappeared down the snake's throat. Plainly the chicken snake, which is not large, and would be more valuable about a house than a cat, is a true constrictor. There were glass snakes, moccasins, coach whips and gopher snakes, all interesting in their way.

A fine glossy coated otter, fully four feet long, roused himself from his noonday nap to eat a fish thrown in to him, beginning, as the keeper said he invariably did, at the tail. The whole museum seems to be kept on fish—"yellow tails"—caught easily in the river with net or hook. The pelicans would catch the fish in their huge mouths, carefully turning them so that the heads would go down first. The whooping cranes, vain birds and fond of notice, dancing in a fantastic fashion at their master's command; the little white egrets running about under everybody's feet; the darter or water turkey, a shy bird with long beak and neck, the latter held much in the shape of a figure 2, all begged for fish and caught them dexterously in their bills.

A great horned owl hooted mellowly at command. A black vulture went tilting from one end of his cage to the other, acting precisely as if he were ashamed of himself and were trying to hide. That rare bird, the monkey-faced owl, stood solemnly asleep on one foot, and when roused began a curious weaving, swaying motion which made it look weird and strange.

There were bears, wildcats, alligators and other strange creatures to complete this interesting and altogether unique museum, to which a visit may very profitably be made by any one interested in animal life. RICHARD GEAR HOBBS.

HARE AND FISHER.

Editor Forest and Stream:

Your correspondent "H. R." in your issue of Dec. 31, thinks he saw an otter chasing a hare on the ice, making, as he says, quick, clean jumps, about the same as the hare. Now the otter does not make clean jumps, but just gathers speed by one or two short jumps or gathers, and then slides—sometimes quite a distance—say from ten to twenty feet, then gathers for another slide. I never in all my hunting life of twenty-five years saw where an otter made clean jumps in running. I have frequently followed them in light snows, and sometimes on top of four feet of snow, over mountains from one stream to another—they making a straight course, as if they knew the way. Neither have I ever seen where an otter chased a hare. They subsist on fish alone, I think, as any one may observe by the fish bones and scales on and about their slides—I never observed any other bones in their signs.

What "H. R." saw following the hare was doubtless a fisher (*Mustela pennantii*, Erxl.). They subsist chiefly on the hare, and they are very adept at capturing them. I once saw a hare come out of the woods on to Lake Mollychunkemunk, running at great speed, and immediately after a fisher on his track. They followed down the lake about a mile, when the hare commenced to circle—quite large at first, and continually making the circle smaller—the fisher always keeping inside the circle of the hare, and so gaining quite a distance in every round, or rather not having to run so fast to keep the hare on his speed, the fisher seeming to take it very leisurely, until the circle became so small as to end at a point—and the fisher was there as soon as the hare, and made short work of him. I had followed down the lake as fast as I could, in hopes of getting in a shot, and so had an excellent chance to see the whole maneuver, but the fisher saw me, and dragged his prey ashore and fled into the woods.

J. G. R.

BETHEL, Maine.

Editor Forest and Stream:

The animal that "H. R." saw chasing a hare was without a doubt a fisher, or, as they are called here, "black cat." They are rabbit hunters.

STANSTEAD.

HIGHGATE, Vt., Jan. 2.

A NEW YEAR'S DAY TRAMP.—On Friday last we took our usual New Year's tramp, and as we always look into birds' nests when they are within reach, we did so on this occasion. While passing through a piece of woods we had stopped to gather some beechnuts, with which the leaves on the ground were strewed. We have not had any snow for the past two weeks, and the ground is as bare and soft as in April. On looking up we noticed a red-eyed vireo's nest, and on examining it found that it was full of beechnuts and fragments of the shells. I filled the nest with cotton, cut off and trimmed the twig on which it was suspended, put into a paper bag and packed them in my collecting bag and now have them among our collection of birds' nests and eggs. I do not suppose that this is the first bird's nest that has been found to be utilized as a storehouse, but as the nest of *Vireo olivaceus* is one of the most beautiful and best constructed of birds' nests, and as it was so well filled it was very interesting to me. And now the query, By what bird or animal were the nuts stored? I found both the downy and hairy woodpeckers in the same woods a few days before, but have not seen the red headed woodpecker, which is known to feed on beechnuts, and I hardly think that it was done by the red squirrel, as the nest is in perfect condition and the limb so small—not over $\frac{3}{8}$ of an inch in diameter two inches back of the nest—that it seems impossible that a squirrel could sit there and eat the nuts, which must have been done. I have just turned the nuts out of the nest, and find there is a good handful, containing 33 perfect nuts and the balance shells. I find there are no marks of teeth, as there probably would be if it were the work of a squirrel. During our tramp we also saw a frog, which we tried to capture but without success. We saw quite a number of crows, a red-tailed hawk (*Buteo borealis*), a few red-bellied nuthatches (*Sitta canadensis*), tree sparrows (*Spizella monticola*) and common juncos —*Junco hyemalis* I presume is the correct name now and is very appropriate at present, as we have no snow. As an indication of the weather I inclose a twig of honeysuckle in bud.—J. L. DAVISON (Lockport, Jan. 4).

THE MILD WINTER.—It is not often that we see shrubs in blossom at this season of the year in this latitude, but there is a *Spirea prunifolia* on the estate of John W. Mason from which the writer picked a flower, quite well developed, on the 3d inst., and several twigs that appeared just ready to bloom. Robins have been around in unusual numbers up to the present time, and bluebirds can be heard almost any day. Will some of the readers of FOREST AND STREAM tell us what the mild fall and winter has developed in their region?—A. H. G. (Scarborough, N. Y.)

DOMESTICATED WILD DUCKS.—I have some tame American mallards and hybrids between mallard and dusky ducks. The dusky drakes which I originally had died, and unable to get others the ducks, only two, mated with mallard drakes, and the hybrids are fertile *inter se* to the sixth generation. The birds mate for life and very seldom quarrel, running together in peace and harmony. The only restraint upon them is an annual clipping of the flight feathers on one wing. They rarely try to get over a stone wall four feet high.—E. S. (Somerset, Mass.).

ANOTHER ALBINO GROUSE.—Minneapolis, Minn., Jan. 7.—In your paper of Dec. 31 I notice the note on the albino ruffed grouse. I mounted one for Merrell Ryder, of St. Paul, Minn., Nov. 26, that was pure white. The only markings to be seen were the bars in the tail, which were of a very pale pink or pinkish gray. I also mounted an albino deer (whitetail) in the winter of 1884 for A. W. Ehle, of this city. This specimen was pure white as snow and not as large as the usual size of white-tail deer.—WILLIAM HOWLING.

LIVE RUFFED GROUSE.—*Editor Forest and Stream:* Nobody seems to be able to catch ruffed grouse alive "on purpose," though frequent cases are reported of their accidental capture. Should any such instance occur to any reader of the FOREST AND STREAM, I should be greatly obliged if he would communicate with me, as I am desirous of procuring a live male bird for some interesting experiments now in progress.—JAY BEBE (Lock Box 110, Toledo, O.).

ACAPULCO DEER.—Mr. E. A. Samuels, president of the Massachusetts Fish and Game Protective Association, has a pair of deer from Central America, which we understand he wishes to dispose of to some private deer park.

HERONRY.—A Philadelphia correspondent wishes to know of a heronry within 150 miles of that city.

THANKS TO DR. PASTEUR.

"Sick him on me, Jimmie; I want to go to Paris!"—*From Life.*"

THE TRAJECTORY TRIAL.

Editor Forest and Stream:

Your work has been well done. The spirit of fairness and impartiality which has characterized it from first to last will command the respect of all, and the consciousness of this fact will be your greatest reward. E. A. LEOPOLD.

NORRISTOWN, Pa.

Editor Forest and Stream:

The last shot having been fired and the bullet sped on its way to make its record of good or ill, it, together with the few scores that have preceded it through the tell-tale screens, have, I predict, done more for the hunting rifle than all that has been written on the subject since the dawn of time.

I would like to call the attention of the rifle manufacturers to one of the many interesting facts that this trajectory test has brought out. It is this: We have heard a great deal in years gone by about light bullets and their flat trajectories. The old riflemen have laid down the law, and it has been accepted without a protest by nearly all riflemen.

Let us look at the figures. Starting with the first on the list, we find that the .50-95-312 has a rise of 11.242 inches, while the .50 95-300 Express gives 11.306 inches under the same conditions. Rifle No. 2, .50-112-350 has a rise of 10.289 inches, while .50 112-303 Express is 10.493, higher again. No. 3, .50-112-350, and .50-112-303 gives half an inch in favor of the heavy ball. The English rifle gives the same result. These being the only Express balls that we have an opportunity to compare let us see how the solid balls compare with each other. First comes the Government .45-70-405, which gets a shade ($1\frac{1}{4}$ inches) under the .45-70-500 by being helped down the range by a twenty one mile wind. The Remington .38 51-822 is ahead of the .38-52-255, and both ahead of the 38-45-118. And in the .32-cal. we find the same thing. Now, with these facts before us, is it not high time that we knew more upon this subject? I very much regret that the FOREST AND STREAM did not extend further into this subject, as for example the Ballard rifle of .40-cal. has no less than five different weights of bullets adapted to it, only one was tried, and the same is true of most of the other makes. I.

AKRON, Ohio.

Editor Forest and Stream:

I would have liked your "Tabulated Summary of Trajectory Tests" better had it given the actual average weights of powder and of bullets used in the firing of each gun; and yet I do not know as I ought to say this, for it does not seem the right thing to "look a gift horse in the mouth."

If one thing is demonstrated more clearly than another in these tests, it is that the trajectory of a bullet depends upon the weight and shape of the missile and the weight and quality of the powder, other things being equal.

And it seems to be as clearly proved that the twist of the rifling does not affect the flight of the bullet for any distance. In practice, the smaller the bore the more abrupt the twist, seems to be established, on the principle of the smaller and lighter the top the shorter time it will revolve, and *vice versa*. This knocks the bottom out of the old theory that special rifling is required for every change of charge in the same gun. When that criticism was made of the "new gun principle," my old muzzleloader broke into a broad smile to see the FOREST AND STREAM sitting down on that crooked pin.

In the tests of the .50 calibers the Winchester and the Whitney-Kennedy guns, both loaded with ammunition from the same box, powder 90.9 grains, bullet 312.27 grains, produced the same trajectories precisely, allowing for the corkscrew motions, and yet the twist of the former was one turn in 60 inches and that of the latter one turn in 30 inches.

In the .45 caliber class the same proved true as between the Martin and the Bullard guns, though the former had a twist of 20 inches and the latter of 30 inches.

The irresistible conclusion is that had all the guns of like caliber been chambered to receive the same ammunition, there would have been no practical difference in their trajectories, though the amount of their twist might vary from 72 inches up to 16. The only principle involved is to give such an amount of twist as to insure a revolution of the bullet during its longest time of flight with its minimum charge of powder, according to the caliber of the barrel.

The gyratory motion of a bullet in the air, I think, is fully illustrated by a revolving top on the floor. The bullet is probably canted as it leaves the muzzle, which may not be quite square, and the pressure of the powder gas not being exactly even on the base of the bullet. In the larger bullets this would be liable to show the most. Recognizing this tendency, the gunmakers cut off the tips of their bullets to insure accuracy, as the bullet revolves upon the edge of the small circle so left while it is recovering its true position.

COMMON SENSE.

WASHINGTON, D. C.

Editor Forest and Stream:

Many of your readers would no doubt like to be able to figure out the trajectory of their rifles on a 5-yard range, if so it can be found very nearly by subtracting half of the rise at 50 yards from total rise at 25 yards; for instance, in one of your 100-yard tables the rise at 50 yards is 3.746 and at 25 yards 2.932, now if the rifles were sighted for 50 yards instead of 100 its highest flight at 25 yards would be 1.059 inches. J.

CLEVELAND, O.

Editor Forest and Stream:

I read with much pleasure the experience of the trajectory test and see that the old-time muzzleloader has marched to the front, both in accuracy and trajectory, but this is just what I had expected, and now for a little principle on breechloading rifle chambers that I will now explain and hope the readers will understand what I mean. I don't want your readers to understand that my rifle chamber principle is correct and the only way to chamber a breechloading rifle, but I only give my idea and say has it ever been tried? And now for what I mean. To get the truest shooting out of a muzzleloader we must have a false muzzle and a bullet starter to set the ball in the grooves, and so we get good shooting, and right here is the whole thing. Now can't we use this false muzzle and starter on our breechloader? Let us see, the starter we can not use, but the false muzzle we can, but we must change its place and instead of putting it on the muzzle we will put it in the breech of the rifle in the shape of a smooth and tapered chamber three or four inches in length right in front of the shell chamber. This second chamber, that end toward the breech, should be a trifle wider than the end toward the grooves, this end to be the exact size of the bore and be flush with the lands of the rifling, the grooves being lower. With such a chamber in the breech the bullet would have a smooth place to travel over of some three or four inches before reaching the grooves and would go over the grooves without any jumping and jarring. Now if this principle has never been tried before some one ought to try it. J. W.

MOLINE, Illinois.

Editor Forest and Stream:

I wonder what double rifles, American made, your London correspondent "J. J. M." has ever seen? I think there are rifles in this city that would not have suffered in the trajectory trial. Hope your trouble and expense will be rewarded. JOHN BOYDEN.

WORCESTER, Mass., Jan. 2.

Editor Forest and Stream:

I like the way you are reporting the experiments, giving every detail. That is what is needed, and then every one can form his own conclusions. The experiments evince great care and will be very valuable. P.

MEE-TEE SEE, Montana.

NICK ON THE TRIAL.

Now that the tests are over I suppose that the report is a fair object of attention on the part of all us riflemen, and surely it is extensive enough to stand a great many rounds. First of all, I would aim a double-shotted round of thanks at FOREST AND STREAM for its enterprise in undertaking and carrying through such an exhaustive series of tests, all the better because they afford us comparative readings of the doings of the great bulk of American arms as now offered to the hunting fraternity. I cannot see how they could have been much bettered, unless perhaps there was something about that fixed rest which would influence the shooting of the rifles. I have my own theories on this question, and would like to hear from others who have had more experience in test-shooting. It must have been a very severe trial of some of the magazine guns to place the butt-plate against an immovable base and then pull the trigger. A glance at the construction will show how this must be so. In some of them the force of the enormous blow dealt in recoil by the discharge of the arm is carried back and transmitted through the stock to the shoulder of the shooter through the very thin side plate of the breech action into which the breech-block pin is inserted. When there is ample chance for the swing back, such as takes place in off-hand shooting, these side plates get no undue strain; but with the butt fixed, the tendency is to buckle these plates, and so the breech action refuses to work, the carrier block jams, and a general hitch results. It may be an unfair test to put a gun to, but it strikes me that a weapon so constructed as to stand this test is preferable to one which shows a weakness at this point. I think that some of the cases where your report speaks of obstreperous arms and obstinate weapons could be explained on this ground.

The grand hoop-la which I expect to see rise up after the report is fully understood will come from the muzzleloader fraternity, who will find great comfort in looking up and down the column of trajectory averages, and when it is seen that the figures opposite the muzzleloaders are the lowest there will be a chorus or "I told you so," and they will at once proceed to put another feather in that old antiquated headgear which the "has beens" delight to wear. Just the same, however, let the muzzle men load up their ancient weapons with the trifle of powder which the breechloaders find amply sufficient, and then we shall have a comparison of some value. Your determination to impose no restriction whatever was the opportunity which the muzzlers wanted, and what did they bring? Great ungainly weapons, in the nature of metal freight, and into these bits of armament they poured enormous doses of the sharpest, quickest powder obtainable, and then putting atop of it a mere pellet of a bullet, they fire it off and then expect practical riflemen to close their eyes to all this preparatory manipulation—to everything, in fact, but the record as shown on the screens.

Nobody for a moment supposes that, other things being equal, the trifling superiority of the muzzleloader in accuracy and flat fire line is anything like a compensation for the nuisance of having to put charges in at the muzzle and the general botheration of this class of arm, as compared with the convenient breech arm with its fixed ammunition.

At another time I hope to have opportunity of saying more, after my brother riflemen have had their say upon the subject. I would particularly like to hear from "P." and from the erudite and always interesting Major Merrill. At present I will content myself with another hearty "thank you" for what the report takes out of the domain of surmise into the clearly-defined space of absolute fact. NICK.

FOREST AND STREAM'S GRIZZLIES.

Editor Forest and Stream:

If the moral training of your bears is most desirable, I think you would better box them up and send them to me. I will turn them in with a tame deer, and teach the three to bear and forbear. Considering the tutor and everything, the educational opportunities are excellent. They might be trained to agricultural pursuits, perhaps taught to dig potatoes or run a power churn with the effigy of a tenderfoot suspended just out of reach before them. And they would be good things to have in the melon patch when off these duties o' nights, or among the early fruit trees. It would be comforting to the fruit grower to find scattered about his grounds in the morning the remains of a dozen or forty naughty boys; so comforting that if the bears objected to his gathering his melons, apples and pears, he would be almost willing to forego the pleasure and profit thereof.

If they were turned loose anywhere in the Eastern States they would be a perfect godsend to the editors of country papers in affording items. Each might have a column devoted to them, and how much better reading than the reports of the latest wooden wedding or surprise party, would be such items as, "A reliable informant says that the FOREST AND STREAM grizzlies were seen on Bald Mountain yesterday." (There is a Bald Mountain wherever there are any mountains.) "We are pained to announce the loss of a valued subscriber by the F. & S. grizzlies." (Desperate fight, mangled, etc.) "Numbers of armed men have turned out to do or die, and exterminate the monsters. P. S. As

we go to press we learn that the maligned grizzlies last night killed two tramps, a book agent and a lightning rod man. Warlike demonstrations against them are stayed, and it is proposed to open a subscription for the purpose of introducing more bears of similar proclivities."

Does a grand advertising scheme dawn upon you? to letter the bears "FOREST AND STREAM, $4 per year!" and turn them loose? But then would those who ran stop to read?

FERRISBURG, Vt. AWAHSOOSE.

Editor Forest and Stream:

Wait till they grow enough to be big and wicked, then turn 'em loose among the foolish Newark doctors, who have raised such a silly scare about hydrophobia. SENECA.

RAHWAY, N. J.

Editor Forest and Stream:

Let the grizzlies stay at Central Park, where they will do the "greatest good to the greatest number." A Happy New Year, an' lashins of 'em, to dear old FOREST AND STREAM.

CASSELTON, D. T. H. P. U.

GAME PROTECTORS' REPORTS.

FROM the annual reports of the New York Game Protectors, sent in to Gen. R. U. Sherman, secretary of the Commission of Fisheries, we take the following extracts:

FOURTH DISTRICT.

Francisco Wood, protector for the fourth district, in his annual report, writes: "I spent considerable time during the year inspecting the markets at Schenectady, Albany and other places. Also made tours through the counties in my district to look up cases of illegal fishing. In May I captured a net in Schoharie Creek. In August secured the conviction of five persons for illegal fishing; they paid fines of $25 a piece. In October I obtained a judgment of $25 against an offender for owning an eel rack. At present I have no complaints and no business."

SEVENTH DISTRICT.

Peter R. Leonard, of Ogdensburg, protector for the seventh district, in his annual report, says: "I visited a number of lumber camps last winter, and found that, as heretofore, many deer had been slaughtered in the deep snow. In the summer I spent several weeks in the woods of Franklin and St. Lawrence counties, where annually large numbers of deer had heretofore been killed prior to Aug. 1. Last year, however, I found that very few were so taken. After Aug. 15 I devoted my time to looking out for violations of the anti-hounding law. St. Lawrence county was comparatively free from dogs from Tupper Lake down the entire length of Raquette River. The Grass River country and Cranberry Lake region were also free. On the west and middle branches of St. Regis River to McDonald Pond and Bog Pond crossing the deer were well preserved. The only hounding I learned of was done on Bog River, at Little and Big Tupper Lakes, and in the Saranac region. Guides, hotel keepers and some others seemed determined last fall to put the game laws and the protectors to a severe test. Men who at Alexandria Bay were anxious to have the laws enforced, as far as fishing in the St. Lawrence River was concerned, went into the woods with their hounds and broke the game laws as recklessly as any fish pirate. There are other matters that are grievous. The still-hunter who visited the woods last fall and met with good success in shooting because the game had been protected from the dogs, was loth to leave even on Dec. 1, after having killed from ten to forty deer. I think there were more deer killed for market in St. Lawrence county last fall than in four or five years before.

"Hunters are not willing to leave their hounds at home even in the month of June. On Bog River, June 1, I met a party of eighteen men with seven boats going in, as they said, for a three weeks' trip. They had their hounds along and were loaded down with shotguns and buckshot. Until such people are made ashamed of their nefarious doings and have a better idea of the necessity for game protection, the present force of officials in this district will be found too small to do the work required.

"During the past year I have traveled over 3,629 miles and my individual expenses were $374.73. Judgments were recovered as follows: Barker and Whitby for unlawfully killing deer, $50; M. P. Phillips, netting fish at Chippewa Bay, $25; Cross and Burners, killing deer, $100; Geo. Hunter & Co., same offense, $100; Benj. and Louis Petrie, $75; James Petrie and L. Plantz, illegal fishing, $25; Mrs. Simeon Plantz, same offense, $30; Dr. Chattuck, same offense, $50; total $455."

EIGHTH DISTRICT.

Following is a summary of the annual report of State Game Protector Thomas Bradley, of the eighth district: "John Pauley convicted of killing deer out of season, in Hamilton county, was fined $50 and $23 23 costs, which he paid. A set line 1,200 feet in length was captured at Piseco Lake and destroyed. Two night lines were destroyed at Caroga Lake, and many others on the Mohawk River in Montgomery county. At Llewic Lake, seven gillnets valued at over $600, were captured. In the town of Mayfield two seines, valued at $85, were taken, and the owner, M. Ferguson, prosecuted. The case is still held open. The case of Elijah Camp, arrested for shooting deer out of season, is also pending."

Protector Bradley has commenced action against Charles Blanchard for hounding deer near Beaver Lake, and against Peter J. Casler and another of Little Falls, for robbing spawning beds of trout and using dynamite in one of the outlets of Pisco Lake. He also has evidence for several other suits.

In the northern part of Hamilton county he shot three dogs which were running deer. The protector thinks the anti-deer hounding law requires amendment to make it effective. He says: "I frequently find dogs with hunting parties in the woods. I think the presence of dogs with a party should be deemed evidence against the hunters and an amendment of the law to that effect would be a great help to the protectors. The season for woodcock and partridge shooting should open on the same day. The Board of Supervisors of Fulton county passed a law prohibiting market hunting."

TENTH DISTRICT.

Nathan C. Phelps, of Remsen, State game protector for the tenth district, in his annual report states that during the past year he obtained two judgments of $5 each for violation of section 13 of the laws of 1879 (killing songbirds out of season), a judgment of $50 in Herkimer county for the unlawful killing of deer, also one of $50 in Oneida county for hounding deer. He also had a suit for polluting streams in Herkimer county, which was settled by the payment of $40. Speaking of the deer-hounding law, Protector Phelps says: "I am of the opinion that the law has been generally observed, though I have heard of a few violations. The floating season was very poor, and as far as I have been able to learn but few deer were killed in front of the 'jack.' The weather was cold and damp, and consequently deer did not come to the water as much as usual.

"The still-hunting was better. The deer were quite tame, not having been run with dogs, and were easily approached. Many were killed in this way. The pot-hunters were in the woods in force, the Pennsylvanians taking the lead in this respect. More deer were killed in November than all the rest of the season, and the most of them were shipped to market. Regarding the anti-hounding every person has ideas of his own. Those who like hounding and own dogs are opposed to the law, as are the hotel men, who make money from the parties who go into the woods to hunt deer with hounds. The guides who have had good luck still-hunting are in favor of keeping the dogs out of the woods and will help to do it. In fact, every one has a different idea of how the law should read, and it is impossible to please all. The most effectual way of preserving deer would be to cut off from the shooting season one month in the fall, as this would prevent parties from other States coming here and hunting for the market.

"While on the south branch of Moose River last fall I met Frank Hall, William Leight, George Barber and Nelson Chandler, all well-known guides. They reported having found the skeletons of seventeen deer in the vicinity of the outlet of Canachagala Lake. They thought from the appearance of things that the deer had been killed by wolves. A wolf was killed at North Lake last winter and I saw tracks in that section last month. The wolves should be hunted out before they get too numerous. If the State bounty on wolves were raised to $50 I am of the opinion that it would start new hunters out after them. The old wolf hunters who did such good work in the Adirondacks several years ago are all gone."

FIFTEENTH DISTRICT.

State Game Agent Geo. M. Schwartz, of Rochester, protector for the fifteenth district, in his annual report says: "I was employed 134 days, and during that time seized and destroyed 88 nets, 2 seines and three spears. Their aggregate value was $1,230. I have instituted legal proceedings against 25 persons for violations of the fish and game laws. Judgments amounting to $228 have been obtained and the following suits are still pending: Against Melvin Fisher and A. Dunham, of Orleans county; Robt. Breeder, Wm. Carson, Henry Andrews, F. Ridgeway, Chas. Howard, Daniel Tompkins, Daniel Clump and Robert Scott, of Wayne county, all for illegal fishing; also against the Rochester Paper Mill Company for polluting the waters of Genesee River."

SIXTEENTH DISTRICT.

State Game Agent Stephen A. Roberts, of Buffalo, protector for the sixteenth district, reports as follows: "During the past year I traveled 2,823 miles and my expenses were $138 39. I seized and destroyed four fyke nets valued at $55 and two seines worth $80. J. B. Stafford & Co. were fined $50 and $20 costs for having venison in their possession out of season. Fred Janner, for drawing a seine, paid a fine of $100; W. L. Chamot, his assistant, was fined $10. John Roberts, whom I sued for killing deer out of season, died before the case was tried. I have requested District Attorney Ottaway to commence action against Gilbert W. Smith, of Irving, for fishing with pound nets. The season for black bass fishing opens here May 20. This is wrong, for these fish do not go on their beds in Niagara River until the forepart of June, and poachers have everything their own way as things are now. If the season for bass opened June 20, or better still July 1, the poachers could do nothing, as the bass would be off their beds and in deep water. In addition to this, the weeds would be so grown that nets could not be used."

STRAY SHOTS FROM AN OLD RANGER.

II.

HAVING been born and raised in Connecticut, of course my earliest education in regard to game and the delights of its capture began there; and I assure you it was not neglected for any fault of mine. I must plead guilty to the charge of trapping birds, especially partridge, when a boy. I did it, and that too successfully; so I know how surely one can sweep the woods of the last unsuspecting partridge by appealing to his crop, and then encircling his neck with the deadly snare. I have often caught the last one of a brood of ten or twelve, taking one each day till they were all gone. I will not say I derived no pleasure from this, for I think I had a boyish pride and satisfaction in going to my snares and finding a poor fellow hanging there by his neck, a victim to his appetite and my craft and deception. But as soon as I became the possessor of a gun, I abandoned this process, which was literally a "delusion and a snare," not because there were laws against it—for at that time there were none—but in some way I happened to see it was wrong, and I have never ceased to regret that I was ever guilty of the murderous practice. Ever since I have "taken unto myself a law," which made me kick to smithereens every trap and snare I have found in the woods. This probably is a high-handed procedure on my part, but it is quite certain I have done my share toward breaking up the trapping of this kind of game.

Since I have "gone out into the woods," it has always been my greatest delight to get back during the fall season among the rough and rugged old hills and valleys where I spent my early life, and with dog and gun to wander and dream, occasionally having my reveries broken by the announcement of my dog that "there's game near here," when I would get down to business—steady the old dog's eagerness (for in the usual thick underbrush of this locality one has to work very carefully) until he made his point, when I would renew the acquaintance of a woodcock, quail or partridge that it seemed to me I had known in the years that are gone. For me, there is more delight in seeing the dog carefully work up and point, and then in bagging this one bird, than there is in slaughtering and slashing dozens in other localities.

I have never failed to visit the old stamping ground during the fall season when I have been within a reasonable range of it, and my recollections of those trips are among the most cherished of my life. The picture of the whole country is now fresh in my mind, and will remain there as long as memory lasts. I can see the broad landscape of hill and valley, whose foliage was painted with a wealth of colors which none but nature's artist can produce, and in no place on earth in such exquisite profusion as there, while the whole was covered with the soft dreamy atmosphere of an Indian summer. Here and there at long intervals nestled the quaint old dwelling of the farmer, whose inmates seemed unselfishly glad to know that the little patches of stubble where they had cultivated buckwheat and rye were the means of affording us so much pleasure. I say "us" because poor Comf, an old chum of mine who was "to the manor born," and who never strayed or left it till "called hence to be here no more forever," was ever ready to join me in my week's sport, and I had seldom spent it without him. He was the best shot and hunter for the three game birds of that locality I ever met. He was a tough wiry little fellow, as quick as a cat; and the only fault I could ever find with him was that he would shoot for a market, but never till after we had taken our annual tramp; and I think even then he hunted more for sport than profit. He knew where every bevy of quail were raised and the stubble on which they fed, and the cover to which they restorted after satisfying their hunger—he knew the haunt of the partridge and the location of the purple grape and the wintergreen berries on which he fed; and he knew which way and just how far he would go if flushed before we were near enough for a shot; and many a time has he said to me as we were approaching a thicket of alders, "You go round and stand in that opening on the other side, while I work the dogs carefully up on this side, and if he gets up give it to him," and I have tumbled many a partridge in this way. He knew all the soft springy spots among the alders, and the smooth grassy patches under the white birches where the woodcock, while on their journey from the north, plump, solid, strong and fat, delighted to stop and linger till the cold and frost of approaching winter bade them resume their journey south. Knowing these things, we did not have to hurry and range in an aimless way, but could lay out our day's jaunt and go over it in a quiet and pleasant way, bagging a few quail here, and a brace or two of woodcock and partridge there, which with our lunch at noon—these intermingled with the jokes, stories and honest friendly chat, would fill the day with unalloyed delight.

This may not seem like sport to the dash and push of many sportsmen of the present day; but I have tried many a field where one could warm the barrels of his gun by the frequency of his shooting, but none warmed and satisfied the yearnings of my inmost nature like those tramps over the old stamping ground of my early life. A.

"A WILD GOOSE CHASE."

"But pleasures are like poppies spread,
You seize the flower, the bloom is shed;
Or like the snowfalls on the river,
A moment white, then gone forever."

—*Tam O'Shanter.*

IS there a man who has not, at more times than one in his life, realized the full force of the language which I have quoted? Can a sportsman be found who has not had the most glowing anticipations "turned into ashes," and instead of "a good time" had bitter experience of the fatality of human hopes? At all events, I have met with the saddest of disappointments, and expect, if I live even a few months longer, to have a repetition of them. But hope is an important factor of life, and in itself affords much pleasure.

About the first of the present month I had an engagement to visit Chatham county and try the birds in the neighborhood of my old and hospitable friend Mark Bynum, who has given me a standing invitation to make his house my home during my hunting expeditions. When the day came my companion, Mud, and myself and my little pointer Argo—who is as active a fellow "as ever lap a slough or dyke"—started on foot to make the journey of six miles from Egypt, on Deep River. On the route we bagged about a dozen birds, and these helped somewhat to give variety to our morning's meal. They were not needed at all, for Uncle Mark's first salutation was, "I'm glad to see you. I killed hogs to-day and can give you plenty to eat." This was joyous news to Mud, whose capacity at the table is well known, and it was by no means offensive to me. The next day we bagged thirty-three birds, and the following morning bade our entertainers farewell. Ten birds at Egypt before we took the train for Sandford completed our trophies. Game was not abundant.

We should have remained another day and tried some fields which had not been hunted, but for the fact that I had accepted an invitation to join some friends, within a few days, on an aquatic excursion along Topsail and Stump sounds to the waters of New River, in the county of Onslow.

On Sunday morning, the 6th of the present month, the writer, with Tecel, Wat M. and Crickett of Saint's Rest, with his dogs Jack and Dot, and Murchison's Old Mark, left the Orton House in Wilmington, for Stokley's, on Wrightsville Sound, where M.'s sharpie, Nina, and a pilot boat were to meet us, so that at an early hour on Monday we could set sail for what we were told was a sportsman's paradise. We had a bountiful supply of coffee, sugar, crackers, bacon, bread and other things in that line, and plenty of blankets. We had also provided ourselves with an excellent tent, 12x9, our guns were in capital order, and we hoped to enjoy ourselves with a quantity of sport rarely falling to the lot of mortals. It had been reliably reported to our companion Wat that the waters near the mouth of the river were swarming with geese and ducks, and that we could shoot until we became disgusted with the abundance. We knew that oysters, as fine as ever grew, could be had. However, we expected that our menu would certainly consist of ducks, curlew, willet, plover and the Fullard's Creek bivalves. With such anticipations Crickett and Wat carried each five hundred loaded shells, fitted for all kinds of game. Tecel had about three hundred and fifty, and I, being more moderate, only took two hundred and seventy-five.

The trip might, very probably, be justly characterized by the lines:

"The King of France, with twenty thousand men,
Marched up the hill, and then—marched down again."

But to please all anxious friends I am inclined to give your readers a more particular account of our ever-to-be-remembered "wild goose chase."

With a rising tide, on Monday morning, the 7th of December, A. D. 1885, our luggage was safely stowed on the sharpie and we and our dogs comfortably seated on her sides. Pinner, of Smithville, took the helm, and Owen Jones, a gentleman of color, stood at the prow. Gus Latow, a native of Oporto, manned the pilot boat. After cruising toward all points of the compass and often against both wind and tide, sundown found us just nine miles from our starting-point. The fruits of this day's labor could have been put in a gallon measure. A dry spot in a forest o

pines was selected as our camping place, a roaring fire soon lighted up the darkness, the kettle was steaming, some bacon was broiled, the coffee made, and a hearty meal followed. Young pines were cut down and a wind-rampart was made to shield us from a biting northeaster which had sprung up. We declined to set up the tent. In a short while our blankets were spread and we "sank on the ground; overpowered;" sleeping soundly until the cheek of the east showed its first blush. Then after a substantial breakfast, in which neither duck nor plover was found, we left, hoping for "far greener fields, far fresher flowers."

This day was but a counterpart of its predecessor. The distance made was about the same. The sun was rapidly donning his night dress when we drew up to Sloop Point. A part of our forces made a virtue of necessity and camped upon the floor of a rude shanty, while Teceel and I sought the hospitality of an old friend of mine, who lived a few hundred yards from the water. Here we found a warm welcome and the comforts of an excellent bed. Next morning we left before the family had risen, went down to the water, got breakfast, and spread our canvas to the inviting breeze. Soon after leaving, Gus, who has been a whaler, told us that it would "rain bucketsful" in a short while. As Owen was a stranger to a part of our route, we engaged Blake, the tenant of the shanty, to act as our pilot to the "haven of our hopes." Low water and adverse winds retarded our progress, the rain fell in torrents, and our guns, shells, blankets and provisions, not to speak of ourselves, got rather damp. My little leather box saved most of my shells. About midday, while the wind and rain vied with each other in their efforts to make us uncomfortable, our new pilot informed us that he had never gone all the way, but thought he could now find it. This communication startled us. We hauled up at a fishing house which was locked; somebody ripped off a few planks, and we got in to shield us from the "pitiless storm." There was no chance to camp at that place. Gloom was on the countenances of all. As yet we had no geese nor ducks. How and where would we pass the night? Just then two darkies in oiled clothes came up and offered their services as pilots. We traded in a hurry. Back to the boats we went, our luggage was replaced, and we were ready for the perilous voyage to the happy waters ahead. Our friend Wat by accident got into the water and was thoroughly soaked. But on we went. The channels were as tortuous as possible. Unaided we could not have gone through. At last, however, we hove in sight of a small house, near the edge of the water, on Fullard's Creek, and on inquiry learned that we could get shelter—but no beds. This was much better than nothing, and we gladly entered the habitation. A bright fire soon warmed us. Those of us who had dry clothes changed our garments, and soon repaired to the kitchen, where some excellent Java, good bread and butter, and a gallon of Fullard Creek's best oysters made a repast to which all of us did ample justice. Pretty soon we were in the "loft" ready for sleep. Our host let us have the use of a mattress, on which Crickett, Teceel and I stretched, crosswise, our weary limbs. We enjoyed refreshing repose.

Next morning Crickett and Wat got boats, went up Fullard's Creek to some eligible points, and wasted quite a number of shells at sharp-bill ducks on their way to and from their fishing grounds. Teceel and I remained at home. These sportsmen returned with about fifteen sharpbills and one loon. In the afternoon we all went to the Banks, where, we were assured, we should find plenty of black ducks in some fresh water ponds. But, though we saw the ponds, we did not see the ducks. A bountiful supply of oysters at supper and we went to the loft again and dreamed of geese, ducks and brant to fall before our guns the following day. That day came, but at noon we had only five sharpbills. Then we weighed anchor and directed our course to Cedar Point, at which place lives Dr. E. Ward, in whose house we expected to find comfortable quarters. In this we were not disappointed. There we had good fires, good food and good beds, all of which were enjoyed. Reaching his house at 2 P. M., some of us went into his fields for Bob White. We killed about a dozen, and doubtless would have bagged more, but our poor dogs were so punished with sand spurs and cactus that they would not hunt. Next morning we tried the ponds on the Banks for black duck, but black ducks were somewhere else. The fields afforded a few Bob Whites, and night came on.

After we had retired to our room I informed my companions that my business at home would not tolerate the return voyage by water, and that if Dr. W. would furnish even a blind ox and an oyster cart I should try the sandy road. So after breakfast the others "plodded their weary way" to the landing where the Nina pressed the rugged bosom of the waters, while I waited for our host's "gallant gray" to be hitched to the buggy. High winds prevented me from crossing "the dark and stormy water" during that day, and I had to return to the house of my friend and host, and trespass further on his hospitality. The following morning I got across New River at Sneed's Ferry, and sought the house of an old friend who lives near Scott's Hill, in Pender county, thirteen miles from Wilmington. I was warmly welcomed by the Major and his family, and spent a pleasant night under their roof. He and his wife, son and daughter did all in their power to make my unexpected visit an agreeable one, and in this they were entirely successful. The "gude man" is one of the most intelligent men in our State, a good farmer and an eloquent speaker, his son is a promising lawyer, and the wife and daughter are pleasant and genial and hospitable. In a few hours after I bade my kind friends farewell I was in the office of the Orton. Where were my companions? How were they faring?

Soon after I entered the street. My trip was well known. The *Daily Morning Star*, which peeps into everybody's business, had duly advised its readers that our party had gone on a destructive expedition and would return with our crafts well loaded with geese, ducks and waterfowl, some of which, no doubt, would be left in the city to gladden the hearts of our friends. Alas! I met too many of the anxious expectants, and among others the editor of the paper. All wanted to know the result of the campaign. Some even went so far as to suggest that a black duck or a mallard was not an unacceptable present. I was forced to tell the tale, so far as I could relate it. Then, as I went hurriedly down the sidewalk, another would greet me with officious pleasantness, and propound the suggestive inquiry. At last I saw on a corner a group of the good citizens, including the Lieutenant-General of the State, all looking inquisitive—painfully so to me. As I approached them and received their greetings the stereotyped interrogatory was propounded. I was forced now, in desperation, to exclaim in my agony the well-known lines of Virgil, "*Infandum, O Regina, jubes me renovare dolorem,*" and to say to them that I had Lucy Green in good shooting order, and 250 loaded shells, ready to be used on the next scamp who dared to allude to that glorious hunt. They smiled pityingly upon me and I did not shoot them. Such a hunt! How gorgeously painted in imagination; how sombre and gloomy in reality! Reader, do you desire to know the trophies of my struggle? With sorrow I state that one sharp-billed duck, eight Bob Whites, and, to me, an unknown shore bird, were all which I could claim! Your correspondent who asked, some time ago, for a report of an unsuccessful tramp, I trust is now gratified. But, with all the ill luck, I got something of value—I gained experience.

I have said that my companions left me on Sunday morning, the 13th, at Cedar Point. After that I heard nothing until the Friday following, when one of them made his appearance at home. He told me that I knew nothing and was fortunate in my ignorance. In this case it was "bliss." There was on the return voyage a simple repetition. If possible, it was far worse in its accompaniments. On the whole, the journey was a complete "bust." Rasselas, after he left his happy valley, had no disappointments compared with ours. He and we "listened with credulity to the whispers of fancy and pursued with eagerness the phantoms of hope." Happy Rasselas. Prince of Abyssinia!

It may be that at no distant day I may be able to narrate the incidents of a more pleasant performance in stubble, grass, sedge and brush, all around a blazing ingleside, in close proximity to a table and a bed of down. Possibly I can tell how Argo and Eck ranged the fields, how gallantly they pointed the game, and how clearly little Lucy Green made the hills and valley echo her musical voice. My friend Mud may come in for a share in the picture and Crickett may have a place in the foreground, while his melodious voice is singing the "Boatman's Song," as he asks "Enoch to drive dem ponies in" preparatory to crossing the Great Pee Dee.

WELLS.

ROCKINGHAM, N. C., Dec. 19, 1885.

A FLINT-LOCK TRIED AND TRUE.

Editor Forest and Stream:

Your London correspondent "J. J. M.," who under date of Nov. 30, in your last impression, writes a very clever and interesting article on "Rifles and Shooting," has totally misapprehended my intention in the matter you printed Sept. 17. Certainly he is very right in saying, "considering the distance was only 40 yards there was nothing extraordinary in a heavy small-gauge gun hitting a 2½-inch disc with every bullet when fired from a dead rest." Nor is there. But the rifle with which this shooting was done was a flint-lock made in 1787, ninety-nine years ago. It was used at Mad Anthony Wayne's victory over the Indians a few yeas later, in all the Indian wars of the then Northwest Territory, now the States of Ohio and Indiana; at Harmer's defeat; and was handled by an ancestor of mine at the battle of the Thames and the battle of Tippecanoe, and finally it was among those handled by Carroll's Tennessee and Kentucky riflemen that foggy morning, early in January, 1815. "when a crackling, blazing volley ran all along the line," and 2,100 of Packenham's and Keane's British veterans, fresh from the peninsula, commanded by a brother-in-law of the Iron Duke, went down before the "buckskins'" rifles. That a weapon of this great age, absolutely unchanged since it left the workman's hands except to be cleaned, should shoot so well, and that the flint-lock should retain the silkiness of its youth, seemed to me to be worth recording. Hence my mention of it at all. This weapon is only curious and interesting because of its great age and because it is a finely preserved specimen of the sort of arm with which the hardy Southwestern pioneers subdued the wilderness and overcame wild beasts and wilder men nearly a century ago.

In the other rifle tests, with Ballard and Sharps .40-calibers, we used the factory ammunition. The officer of the U. S. Engineers who was with me and did part of the shooting is an excellent shot, and the writer shoots fairly well himself. My own experience is—after a pretty thorough test of them all—that no breechloader, American or English, ever made will equal the shooting of the best made muzzle-loading rifle in deadly accuracy, at from 40 to 100 yards. I am no enemy of the breechloader. It is a very great improvement, especially in double guns, for birds and ducks; and the art of war has been changed entirely in the introduction of a quick-loading military arm of precision that is deadly at 2,000 yards. But where absolute accuracy is indispensable, and unusually neat shooting is required at short range, say 60 to 100 yards, I would rather have in my hands a 9-pound 60-to-the-pound rifle I know of, made by a famous New York interior maker, now dead, than the best breechloader that was ever devised. "Sich is my apinium." Has the late Geo. H. Ferriss, of Utica, left any successor who has his skill and workmanlike knowledge in rifle making?

MISSISSIPPI LOWLANDS.

WESTERN MASSACHUSETTS.—*Editor Forest and Stream:* Your correspondent "Nonotuck," from Holyoke, Mass., "cuts it fat" when he writes you that there are men here in this county (Hampden) who, shooting for the market, "get all the way from fifteen to twenty-five hundred birds apiece" in a season. I do not like to impugn the veracity of "Nonotuck" or any man, but I believe the statement to be not only an absurdity, but impossible. I have shot in this county for twenty-five years and so has Mr. Hammond. I know the best shots in all this county, and I venture the assertion that no man in that time has killed legitimately with his gun, one half of fifteen or twenty-five hundred birds. It is true, as "Nonotuck" says, that grouse shooting this past season has been good. I know and for fifteen years have shot with the best all-around brush shot here, and who shoots over dogs more days in the season than any other man in Western Massachusetts, and his maximum this year is less than six hundred birds. I should like "Nonotuck" to give your readers the name of any man in Western Massachusetts who has even approximated the above score. If he can do it he will reveal to the sportsmen in this vicinity a prodigy heretofore unknown.—E. H. L. (Springfield, Mass., Jan. 10) Holyoke, Jan. 9.—*Editor Forest and Stream:* The printer or somebody else was rather hard on me in publishing my little communication last week. I wrote that the shooters gather from fifteen grouse to five hundred each, the exact truth. Not fifteen to twenty-five hundred, an outrageous falsehood. —NONOTUCK.

LOS ANGELES, Cal., Dec 27.—Wildfowl more plenty than when I wrote. Bagged fourteen ducks Saturday, mostly teal. Sloughs are full of water and ducks now.—C. B. W.

F. W. FREUND, Esq.—Dear Sir: The set of sights received from you not long ago are all that you claim for them, and I think the best of open sights. Respectfully, ALEX. T. LLOYD, JR. (Chicago, Ill., Dec. 2, 1885).—*Adv.*

THE KINGFISHER'S LAMENT.

A KINGFISHER sat on a cedar tree
Absorbed in sad reflection—
Unfolded at length in soliloquy
The cause of his dejection.

"The meadows are black with the frost," quoth he,
"The leaves are slowly dying;
A pitiless wind from the Northern sea
Has set the pine tree sighing.

"The last of my race to the South have flown,
To lands more warmly lying,
To mourn for the brook I am left alone,
And I must soon be flying.

"Each spring where the lilies at anchor ride
Or where yon whirlpool gushes,
I've fished, and I've slept, every want supplied,
Above the rustling rushes.

"The trout and the perch and the slippery cat
My morning menu furnished;
I dined upon pickerel fresh and fat,
And dace in armor burnished.

"But now 'twere less idle to fish in rills,
For men our plaints ne'er heeding,
Have poisoned the stream with their shops and mills,
And stopped the fish from breeding.

"Our ancestors scarce could have dreamed, I ween,
When Phœbus scorched their feathers,
Their children would suffer a pang more keen,
On far off western heathers.

"When first we were mated we little guessed,
In yonder pine tree eerie,
They'd drive us at last to the distant West
Like chickens of the prairie.

"But what with ammonia, tar and dye,
We've ruined our digestion,
And whether there's any healthy fry,
Becomes an open question.

"Haste on, ye rash men, your reward ye'll reap,
For forest razed and stream polluted—
Full warm in your fine-woven fabrics ye'll keep,
But deep your recompense is fruited.

"Ye drink in the waters diseases vile:
Ye feed on poisoned fishes;
But are not your riches increasing while
Death crouches in your dishes?

"Adieu thou perverted and noxious stream,
Abode of loathsome *manes*.
I seek the pure waters of which I dream,
Beyond the Alleghanies."

He rose and his course to the westward swung,
That gay and hardened sinner,
The factory bell unrepenting rung
To call the girls from dinner.

F. W. TRUE.

WASHINGTON.

ADIRONDACK FISHES.

THE long looked for report on the fishes of the Adirondack region by Mr. Fred Mather has been issued in the form of an extract in advance of the 12th report of Mr. Verplanck Colvin, superintendent of the Adirondack Survey, of which it forms an appendix. The title page tells us that the researches were made in 1882, and it bears the date of 1886. It is an octavo of fifty-six pages and one plate of two species new to science. There has been some difficulty in the way of issuing Mr. Colvin's last report, although most of it has been in type for some years, and this extract was printed at the solicitation of the author, who feared that his labors would become valueless with time, and a limited number of copies were printed for him, this being the only compensation he received. We are surprised at the small number of species (twenty-five) which were found there, and that these represent eight families and sixteen genera.

This report contains a great deal of information about the habits of some of the fishes, especially of the land-locked salmon, and is not too densely scientific for the understanding of the well-informed angler. Synonyms, both popular and scientific, are given, and also translations of the systematic names, which will help many people to remember them. The distribution of the fishes received as much attention as time and correspondence would permit, and while not at all complete, shows what lakes do not contain brook trout, where black bass are found, etc. Among the invertebrate life found was De Kay's "living trilobite," which puzzled the author so that he labeled it "the queer animal" and sent it to Mr. Richard Rathbun, of the U. S. Fish Commission, for identification.

It seems from this report that there may be two members of the pike family in the Adirondack region, but the mascalonge is not found there. The eel is thought to be more plentiful than is generally supposed, while the yellow perch exists only on the borders of the wilderness, and one species of catfish is quite common. Of the two species of suckers claimed to be new, it may be said that both Dr. Bean and Prof. Jordan incline to think that they may be dwarf mountain forms of the other two species found there, and Mr. Mather says that at first he inclined to this view, but the fact that the small specimens were adult and spawning at a different season from the allied forms, in addition to some structural differences, satisfied him that they were entitled to specific rank. No pretense of having exhaustively worked the field is made, and it is very possible that other fishes not included in the report will be found by those disposed to look for them; and the investigations will form a valuable basis for future wonders in this field, as well as being of general interest to anglers.

THAT IS OUR MISSION.—Your editorials on the hydrophobia question, short though they be, are to the point, most direct and timely. This every day press has too much "rabical rubbish" on more subjects than this, that wants a well conducted FOREST AND STREAM, to correct for the people these many outputs of ignorance on subjects beyond their reach.—DR. E. STERLING.

CALIFORNIA TROUT STREAMS.

I DOUBT if there is any place in the U. S. where better trout fishing can be had than in California. But the great drawbacks are in the long distance and the hard road getting to the streams. Just before the law was up in this State I went trouting with a chum on the San Gabriel River, which is about fifteen miles to the mouth of the cañon from Los Angeles. When one gets to the cañon he must go ten miles up the cañon before reaching the good fishing. And what a road; boulders two and thee feet in circumference often block the tortuous and hilly way. The only way to get there is to go on horseback from the mouth of the cañon. But when you reach the fishing grounds there are abundant fish and a lovely stream. We camped there two weeks. During that time we took 976 trout, all over six inches; we could have caught as many more but could not have used them. I caught over 100 in one day. We also took guns along for the quail, and altogether had a grand time.

San Antonio Cañon is a good place for trout, and is much more easily reached than San Gabriel. The only way is to go and stay for a week or two at a time.

This is a great place for campers; over 400 tents were on the beach at Santa Monica this year. They made quite a town. C. B. W.

LOS ANGELES, Cal., Dec. 29, 1885.

CAMPING CLUB RULES.

FOLLOWING are constitution and by-laws of the Jolly Hunting and Fishing Club of Hites, Pa.:

Article I.—This club shall be known as the Jolly Hunting and Fishing Club of Hites, Pa.

Article II.—Night of Meeting—First and third Monday of each month.

Article III.—The dues shall be fifty cents per month.

Article IV.—Sec. 1. All officers shall be elected annually on the first meeting night in June. Sec. 2. Nominations for officers shall be made at last stated meeting previous to night of election.

Article V.—Sec. 1. It shall be the duty of the President to preside at all meetings of the club, preserve order and enforce the by-laws of the club. He shall decide all questions of order, act as judge of elections and declare the result of the club. He shall sign all orders on the Treasurer for such money as by a vote of the club shall be ordered to be paid. Sec. 2. The President shall, on the last night of the term, appoint a committee of three to audit the accounts of the Secretary and Treasurer, whose duty it shall be to make a financial and statistical report at the next stated meeting. Sec. 3. It shall be the duty of the Vice-President to assist the President, and in his absence preside at the meetings of the club and perform such other duties as are enjoined by the regulations of the club. Sec. 4. It shall be the duty of the Secretary to keep accurate minutes of the meeting of the club; also make a monthly report of each and every member, which report shall be read in open club meeting on the first meeting night of each month. Sec. 5. It shall be the duty of the Assistant Secretary to aid the Secretary in the performance of his duty, supply his place when absent and perform such other duties as are enjoined by the by-laws. Sec. 6. It shall be the duty of the Treasurer to pay all orders drawn on him attested by the Secretary and none other; he shall receive all money of the club and hold the same until the expiration of his term of office. He shall keep a correct account of all money received and expended, and shall perform such other duty as may be required of him by the club or his office. Sec. 7. It shall be the duty of the Camp Sergeants to see that the tents are properly pitched and attended to; see that there is always a sufficient quantity of provisions and attend to the camp in general.

Article VI.—Sec. 1. Any officer may be removed from his office for conduct unbecoming his station; for absenting himself for three successive meeting nights, unless his absence is satisfactorily accounted for.

Article VII.—Sec. 1. Every person admitted into this club shall pay the sum of $2; also sign the agreement card of the club.

Article VIII.—Any member of this club who is more than three months in arrears for dues shall consider himself suspended until payment of same, if satisfactory to the club

Article IX.—Sec. 1. No member shall speak more than once on the same subject or motion, until all who desire shall have had an opportunity of being heard; nor more than twice without permission from the chair. While speaking, each member shall designate the person spoken of by his proper rank and title. Sec. 2. No member shall be interrupted while speaking except to call him to order, when he shall take his seat and the question of order is determined; when if permitted, he may proceed with his remarks. Sec 3. If two or more members rise to speak at the same time the President shall decide who is entitled to the floor.

RULES.—Article I.—Any member not present at roll call shall be fined the sum of ten cents unless satisfactory excuse be given.

Article II.—Sec. 1. Any member who shall misbehave in the meetings of the club by disturbing the order or harmony thereof, either by personal, abusive or profane language, or disorderly conduct or who shall refuse obedience to the President shall be fined the sum of ten cents. Sec. 2. Any member or members behaving in a manner unbecoming a gentleman while in camp or in every day life, shall be fined the sum of one dollar for the first offense; and for the second offense shall, by a two-third vote of members present, be expelled from the club. Sec. 3. No member or members shall be permitted to enter the club room on the Sabbath day.

Article III.—Sec. 1. No hunting, fishing, playing any kind of games shall be permitted on the Sabbath day, nor swearing or any other immoral conduct while in camp; any member violating this section shall be fined the sum of fifty cents. Sect. 2. Any member known to indulge in any intoxicating liquors while in camp shall be excluded from the club by a majority of votes of members in camp. Sec. 3. No member or members shall be permitted to do any foraging while in camp under penalty of expulsion from the club by a majority of votes of members in camp.

TOWED BY A WHALE.—The steamship Advance of the United States and Brazil Mail Line, which arrived yesterday from Rio Janeiro, brought six men belonging to the whaling schooner Mary E. Simmons. They were rescued on Dec. 1 in an exhausted condition, after having passed two days in an open boat without food or water. The Mary E. Simmons is a New Bedford whaler which late in November was cruising along the South American coast. On the morning of Nov. 29, when the vessel was off the east end of Pernambuco, a school of whales was sighted. Capt. Manly soon brought his vessel close to the whales and gave the order to lower away the boats. The first and second mates got into their boats, and soon each had killed a whale apiece and had fastened on to another. As the first mate's boat had been smashed a few days before, that officer had taken the boat usually handled by the third mate. Capt. Manly ordered John Praro, the third mate, to take a spare boat and join the first and second mates. Praro took with him five men, and was soon among the whales. Selecting a large one, he buried his harpoon in the back of the monster, which immediately dived under water and started off at a frightful rate of speed, pulling the boat after him. Praro kept the harpoon line fast, and the whale sped on until it was eight or ten miles from the schooner. It then suddenly came up under the boat, which it nearly capsized. The boat filled, but by hurriedly bailing her out the men kept her from swamping. The harpoon line was let go, and the oars were lashed to the boat in order to prevent them from being washed away. The men looked around for the schooner. She was miles away and evidently not following them. The sailors watched anxiously, and shortly before dark they saw the schooner heading toward them. She was, however, proceeding slowly. When darkness settled down over the distant schooner it revealed one of her lights, which seemed to be coming nearer for a while and then appeared to stop. Then it slowly grew smaller and at midnight disappeared. There was neither food nor provisions in the boat, and the next day the men began to suffer from thirst. In their longing for water they scarcely felt the want of food. During the afternoon a sailor named Tony, who appeared to be suffering from thirst, sprang up and began to shout in a delirious manner. He fancied that he saw vessels approaching from all directions. He cried to the people on these phantom crafts to save him. Finally he made a spring as if he would plunge overboard. He was seized by two of his comrades, who threw him down in the bottom of the boat and lashed him there. The poor fellow raved wildly, but he was too weak to free himself from his confinement. No vessel hove in sight that day. Thirst kept the weary men from sleeping, and they lay on their seats listening to the sound of the waves and the cries of their raving shipmate. When at length day broke over the ocean two sails were in sight, although many miles away. One of the vessels proved to be the County of Clare, Capt. McNell, which picked up the suffering sailors about noon. The boat's crew comprised Third Mate Praro, Manuel Hommem, Antonio Perrira, Lawrence Lodreviner, Antonio Manuel Lima, and Alexander G. Wood. The latter is a Connecticut negro, but the others are Portuguese. The Consul at Pernambuco secured passage for the men on the steamship Advance.—*Times, Jan. 7.*

THE CHARMS OF RAINBOW TROUT ANGLING.—The law now permits fishing for rainbow trout in the State of New York, and to those of our readers who propose to try it this week, we suggest that outside of the three or four pairs of stockings, they draw on a pair of woolen leggings, which will not at all interfere with locomotion. A little practice with snowshoes may be necessary to the novice, but he will soon master the art of walking on them. Kerosene is said to be good for frost bites and chilblains, a gallon will be sufficient for the day. A heavy pair of fur gloves are just the thing to use in tying on flies and splicing leaders, while a buffalo skin overcoat will keep the body in a pleasant glow. The new combination of camp stool and stove will make an agreeable seat, and axes and ice chisels may be found in any hardware store.

SOLACE FOR ZERO WEATHER.—I have taken the FOREST AND STREAM for nine years, and have every copy filed away to look over on just such zero weather as it is here to-day.—H. C. N. (Ashburnham, Mass., Jan. 10).

HATCHING CODFISH EGGS.

BY JOHN A. RYDER.

THE recent practical success in hatching the eggs of the codfish, at the Wood's Holl station of the U. S. Fish Commission, in a very simple apparatus devised by Capt. H. C. Chester, is my excuse for again asking for a little space in your columns. By the help of this new and exceedingly simple contrivance, the hatching of the very delicate floating egg of the cod becomes as simple, if not a simpler performance, than the hatching of shad or white-fish eggs, now so extensively conducted by the U. S. Fish Commission. By means

of the new method it is possible to hatch out one hundred millions of young cod at a cost for apparatus not exceeding one dollar per million embryos.

During the four seasons of experimental effort in practically solving the problem of cod propagation, not less than forty forms of apparatus had been devised and operated by different persons connected with the work. Yet in spite of all this variety of devices, until now none have fulfilled the required condition even approximately with such complete success as the apparatus devised by Capt. Chester, and now to be described.

The contrivance is essentially automatic and needs so little attention that one man will readily look after 100,000,000 eggs without any difficulty. As in operation at this moment, it consists of a trough 7 feet 6 inches in length, 2 feet in width and 2 feet 4 inches in depth. At about one foot from either end a wooden partition extending within four inches of the bottom is secured. This leaves a space about five feet six inches in length between the partitions, in which six or eight large glass jars are supported with their mouths downward. The jars used at Wood's Holl are ordinary cylindrical, four-gallon glass specimen jars, with a half inch hole drilled in the center of the bottom. The stoppers of the jars are removed and a single thickness of coarse cheese cloth is secured over the mouth with strong twine. The jar is then inverted and lowered into the trough so that the bottom is about even with the top of the trough, and is supported on a rack-work of transverse strips nailed to a ledge near the bottom of the trough. Strips nailed across the top of the trough serve to keep the jars upright.

A still better idea of the apparatus may be gathered from the accompanying figure showing the device in longitudinal vertical section with the jars in place. The trough *A* is filled with unfiltered sea-water through the faucet *i*, the water rising to the level of the line *a* before the outlet siphon *s* begins to operate. The siphon will then empty the trough to the line *b* when it ceases to flow, the water then slowly rises again to the line *a*, and so on repeatedly. It requires ten minutes for the water to rise or fall from the one level to the other, and, since the jars have only a cloth tied over them below, the water rises and falls to the same extent in them. This very slow and gentle rise and fall of water in the jars and trough, has been found sufficient to aerate the eggs and give them all the movement they need.

The majority of the eggs in this contrivance float at the surface, some of course remain suspended below the surface, but an exceedingly small percentage of the eggs ever sink and die as in almost all of the other forms of apparatus hitherto used. The result is that the mortality is probably under five per cent.—a percentage of loss not greater than that experienced in the most successful treatment of shad eggs.

The freshly fertilized eggs, treated with an abundance of good milt, are introduced through the hole in the center of the bottom of the jars, by means of a glass funnel. Beyond an occasional siphoning off of the sediment on the bottom of the trough and the cloth covers of the jars the eggs require no attention until hatched.

Heretofore great mortality has been caused by the use of metal in the construction of the hatching vessels and strainers. Since the adoption of glass, wood, and cloth as the only materials used in the construction of the hatching apparatus, combined with the very gentle movement to which the eggs are subjected, complete success has been attained. The embryos oscillate up and down through a space of only five inches, from the level of *a* to that of *b*, and withal so gently that they suffer no shocks or concussions of any kind whatever. Capt. Chester's device will doubtless be used with great advantage in the propagation of the Spanish mackerel. In twenty-four hours the latter would be ready to be set free from the apparatus, whereas it requires eleven or twelve days to hatch the eggs of the cod, with the temperature of the water ranging from 45 degrees Fahr. to 48 degrees Fahr.

Each of the jars, which are 17 inches high by 9 inches in diameter, will hold from one-half to one million cod eggs, so that an apparatus of the size shown above would accommodate from three to eight millions of ova, contained in six to eight jars, the largest number which could be accommodated in a trough of the size of the one here described.

These experiments show that a violent movement of the eggs of the cod is of no advantage, that such movement is on the contrary injurious, if not mortal, when continuously maintained. The requisite conditions for successful hatching of this important food-fish having been settled, the great station at Wood's Holl affords unlimited opportunities for conducting the work for at least three months of the year, during which time from 500 to 1,000 millions of eggs might readily be hatched and set free with the help of the new hatching apparatus.

WOOD'S HOLL, Mass., Dec. 21, 1885.

THE GERMAN FISHERY ASSOCIATION.—It is with pleasure we note the fact that at a recent session of the Reichstag, the Deutsche Fischerei Verein was given an appropriation to enable them to carry on their work. Heretofore this Association, of which the renowned Herr von Behr, Schmoldon, is president, has done all its work from funds contributed by its members, and has had no government recognition whatever. They have stocked lakes and streams, exchanged eggs with America and other lands, and printed their own reports of work and discussions. Under their auspices the great International Fisheries Exhibition of 1880 was held, and they have done a great deal of good work, finding their reward in doing it. The appropriation is not a large one to begin with, but it is the fact that the German government has begun to take an interest in it, that is cause for congratulation. No doubt the government will be more liberal in future years as the work increases.

SOLES ARRIVE FROM ENGLAND.—On Monday last a few soles arrived on the White Star steamer Britannic, being one lot in a system of exchanges between Mr. E. G. Blackford and Mr. T. J. Moore, curator of the Derby Museum at Liverpool. The fish were so stiff with the cold when they reached Fulton Market, that it was difficult to tell whether they were alive or dead. They were sent to the State hatchery at Cold Spring Harbor, where, if alive, they will be cared for.

FISHCULTURE IN TASMANIA.—Several of the favorite fishes of Europe, such as the turbot, sole and brill, as well as crabs and lobsters, are to be taken to Tasmania, with a view to acclimatize them. The eggs of some of the British fresh water fishes will also be sent there. If they have none of the species mentioned, there is evidently a broad field for fishculture in that land.

BOOKS RECEIVED.

FROM LEE & SHEPARD, BOSTON, MASS.:

Tell Your Wife. Paper, 50 cents.

The Globe Drama: Original Plays. By George M. Baker. Cloth, $1.50.

Parlor Varieties. Part II. By Emma E. Brewster and Lizzie B. Scribner Paper, 30 cents.

The Reading Club. Parts XV. and XVI. By George M. Baker. Paper, 10 cents each.

Ten Boys Who Lived on the Road: From Long Ago to Now. By Jane Andrews. Cloth, $1.

The Popular Speaker. Selections by George M. Baker. Cloth, $1.

The Dawning. A Novel. Cloth, 382 pages, 50 cents.

Five-Minute Declamations. Selected by W. K. Fobes. Cloth, 196 pages.

Five-Minute Recitations. By W. K. Fobes. Cloth, 200 pages, 50 cents.

DID YOU EVER HEAR THIS BEFORE?—Jo Badger used to tell a good story. It may date back to another "Jo," surnamed Miller. I am not going to vouch for the originality of any story that I did not make up myself, and even then I should expect to unearth it in some old almanac, or other joker's cemetery. But, Mr. Badger's story, whether old or new, always produced its effect. Jo would gradually insert himself into a crowd of sportsmen engaged in the popular amusement of proving Ananias to have been but an unsophisticated bungler in his business; and, after listening to their accounts of slaughter wrought among the birds and beasts as to make one wonder that the entire fauna of the region was not exterminated, he would begin in that easy drawl that pertains by right to the acknowledged *raconteur* of the corner grocery: "Speaking of shooting, the longest shot ever I made was back in New York State, when I wasn't much more 'n a boy. I'd been used to handlin' a gun some, but nothing to speak of—wasn't considered no kind 'o shot. Well, it was a Sunday mornin'; I happened to look at an old dead tree away off, most as far as I could see anything. There was one limb left, and a crow was sittin' on it. It was so far off that I couldn't 'a' seen the crow if he hadn't been black and the old tree so gray. I could just see it was a crow and that's about all. The old shotgun stood behind the door, loaded, and I took it up and, just in fun pointed it at the crow. I didn't have no more idea o' hitting that crow than I have now o' shootin' you. But, I sighted him, and without thinking what I was a-doin' I pulled the trigger and bang she went." Here Jo would stoop down, looking for another piece of shingle or something to whittle on; and after a second or so, some impatient auditor would be sure to ask: "Well, d'ye hit 'im?" The surprise and innocent look on Jo's face would be a study, as, with the air of one who had utterly forgotten that any denouement was expected, he would slowly answer: "Hit 'im? Bless your heart! no; didn't come within a mile of him!"

FIXTURES.

BENCH SHOWS.

Jan. 19, 20 and 21, 1886.—Annual Exhibition and Bench Show of the French Creek Valley Poultry and Pet Stock Association. A. L. Braden, Secretary.

Jan. 26, 27, 28, 29 and 30.—Fourth annual dog show of the Southern Massachusetts Poultry Association, at Fall River, Mass. R. G. Masher, Secretary.

Feb. 8, 9 and 10.—Fourth annual exhibition of the New York Fanciers' Club, at Madison Square Garden, New York. Chas. Harker, Secretary, 62 Cortlandt street.

March 16, 17, 18 and 19, 1886.—Western Pennsylvania Poultry Society's Dog Show, at Pittsburgh, Pa. C. B. Elben, Secretary.

March 23, 24 and 25, 1886.—First Annual Dog Show of the New Jersey Kennel and Field Trials Club, Newark, N. J. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

March 30 to April 2, 1886.—Third Annual Dog Show of the New Haven Kennel Club, E. S. Porter, Secretary, New Haven, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club, Edward A. Moseley, Secretary, Boston, Mass.

April 14, 15 and 16. First Annual Dog Show of the Hartford Kennel Club. A. C. Collins, Secretary, Hartford, Conn.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **3092.**

MASTIFFS.

Editor Forest and Stream:

I wish to add a few notes on Mr. Mason's article in yours of Dec. 31, and I am not going to pass any encomiums on it either. The readers of the FOREST AND STREAM are not fools, and furthermore, some wise genius (a "Mrs Harris," I suspect) has discovered that Mr. Mason and I have constituted ourselves a mutual admiration society, and I don't encourage any such organization.

First, as to Mr. Wynn's "History of the Mastiff." It has been published in England, much enlarged from its appearance in *A. K. R.*, with more anecdotes, etc., and should be in the hands of every mastiff man.

As to Hodson and Vero Shaw, the dictum of the former as to undershot dogs, has long been laughed out of existence, and it is strange how many dogs are so formed of whom it would never be suspected. My De Buch, with a long taper muzzle, is undershot, and very few dogs with blunt muzzles are level-teethed. Of course, like everything else, it becomes a blemish, but if the dog's lips have to be drawn back to discover it, there is no sense in blathering about it. The cowhocks was not so very bad, a badly cowhocked dog is certainly not a good specimen, although I would prefer moderate cowhoeks to those nasty, straight ones that many dogs have. With cowhocks a dog can spring, with straight ones he can only rear up and tumble forward, and if a mastiff cannot spring what is he good for?

Vero Shaw, however, makes a greater blunder than this when, after damning the Lyme Hall strain with the faintest of praise, he hedges by saying: "They have often been the saving of a failing line." This is the worst rot I ever came across. The inference from it is that many closely bred lines had begun to run out, when a cross of Lyme Hall blood restored their vigor. Now the fact is that no such cross was ever made. Thompson and Lukey never used Lyme Hall blood. Mr. Wynn got a dash of it once, from Kingdon's Alp, a reputed Lyme Hall bitch, and was glad to get out of it. Mr. Hanbury got a strong dose of it in his Peeress, who was by a proved Lyme Hall dog out of his litter sister, but it will be seen by a glance over the pedigree of what may be called "Hanbury" mastiffs, that he dropped the strain at once. Mr. Nichols used it once or twice, but bred it out with better blood as fast as he could. Kingdon was the only breedor that ever relied on it, and he produced a choice lot of long-legged, long-faced, snipy brutes. He and Wynn had a very sharp encounter over this, and Mr. Wynn so flattened Kingdon out, that whenever he began his interminable prosings about "Lyme Hall," the blood in King, etc., some bored listener would say: "It's nearly Wynn's time to be here," when off would shoot Mr. Kingdon. So, to sum up Mr. Vero Shaw, he was writing about something that he knew nothing of, and made a nice mess of it in consequence.

"Aper," in *Stock-Keeper*, thoroughly ventilated this Lyme Hall business some months since, showing that they were simply a long-legged, ring-tailed lot of red boarhound-like brutes. As to "the hat," Mr. Mason must inquire of "Lillibulero," he is the hat fancier of England. Mr. Mason is quite right as to Ilford Cromwell, it is true that he was always shown low in flesh before Dr. Perry got him, but still it was ridiculous to put him vhc. in the classes he was shown in. The photo from which the head of Duchess was copied was borrowed by Billy Graham of Mr. Nichols as that of Hanbury's Duchess, copied and copy sent me, but I have suspicions that it really was Mr. Nichols's Duchess, but as Mr. Mason says, the purpose of the illustration is fully served, be the bitch who she may.

The artist has given Governor a much better head than the photo shows. By the way, it is curious that Adam and Eve, the parents of Lion, sire of Governor, lived and died in this country, having been brought here by Lieut. Garnier, when he was stationed at Montreal. One of their progeny was owned by a Mr. La Fontaine of Charlestown, Mass., and others went to St. Louis; I have several times tried to trace them, but without success.

The artist has completely ruined the likeness of Turk; the outline is excellent, but the filling in is dreadful—I cannot just say what it is in, but the marked characteristic of the photo it was made from is a calm, gentle majesty, that I have never seen so strongly marked in any other dog, in picture or in life, and I am much pleased to learn from Mr. Mason that the dog had the same expression as my photo of him shows.

Colonel is a Lyme Hall dog, that is homeopathically. I think it was Victor's great grand dam that was out of Hanbury's Peeress referred to above; so if any one wants a pure Lyme Hall dog get one of the progeny of Mr. Smeton's Zulu, or Mr. Morgan's Duchess of Connaught, or of Salisbury, Hero II. or Mr. Exley's Venus, and they will get as near there as there is any use in coming.

There is a little bit of history about Victor and Bosco. Venus, the dam of Bosco, visited Victor in his extreme old age; he was so feeble that Mr. Exley feared the visit would be useless. At last, by great pains and trouble, it was effected, and the result was one pup, and that pup Bosco, way the best Victor ever got.

The priuts of Elaine and Pontiff are exact likenesses of the photos they are copied from, but I rather think Mr. Mason is wrong as to Pontiff. He evidently refers to one of Mr. Hanbury's "Pontiffs" (he had several), while I think this photo is of Mr. Beaufoy's Pontiff, a son of Beau, if my memory serves me right; still, I am not at all positive as to it, but I think that old Ameer in England, and Dr. Alsop's Bardicea, in this country, were the last of Rajah's get.

Mr. Mason probably forgot to say that the picture of Colonel robs him of the bright, earnest expression belonging to his face, the illustration in *A. K. R.* a year or so since is better in this respect.

I agree with Mr. Mason as to his estimate of Prussian Princess, and I vigorously defended Mr. Dalziel in putting her ahead of Rosalind, in spite of "Porcupine's" wrath, but for all of that, if a perfect mastiff bitch head is wanted, take that of Lady Gladys. It would seem impossible to produce a more perfect one, and except her brother Orlando, I have never seen a dog head to equal it. It will be a great loss to American mastiffs if she does not leave progeny by some such dog as Nevison or Hero or Cromwell.

Mr. Mason's account of the love scenes with Colonel reminds me of mme with Ilford Cromwell and that puppy Duke at New York shows. Poor Crom. was badly down-hearted when he first appeared there; he is an exceedingly affectionate dog, very solicitous of fond ing and attention, and his then owner, Mr. Lee, was in extreme bad health and unable to pay any attention to the dog. As I had been a correspondent of his English owner, I took notice of the dog, and patted him somewhat; this touched his "heart bowed down", and every time I passed his box there was a demonstration, and I had a dozen holes in my coat sleeve, and a spoilt pair of gloves as souvenirs of our acquaintance. The same was the case with Duke last spring. In fact, mastiffs, as a rule, are exceedingly easy to make acquaintance with at a show, and pretty much the reverse at home—Crom. was very distant when I called on him at Mr. Lee's. Hero was quite accessible at New York show, but bristled up and growled when I presumed on former intimacy and went straight up to him at Ashmont. Sometimes the reverse is the case. Turk growled at me at Boston show, and Mr. Lee, his owner, had never heard him growl. Cleopatra growled at a stranger at Cleveland show, and I had never heard her growl before, but if a mastiff allows you to put hand on its head, you are safe to pet and fondle him to your heart's content.

It must be remembered that all I have said as to looks of dogs, is derived entirely from their photos from life (except those dogs that are in this country), so due allowance must be made for inaccuracies. In a general way, I may say that the fault in the pictures is the shading on the nose, making them look like wrinkles, an appearance shown by none of the photos, except that of Pontiff. W. WADE.

HULTON, Pa., Jan. 4, 1886.

[In my communication last week, for "I am sure that the members of the A. K. C. are above, etc.," read, "I am sure that three members, etc."—W. WADE.]

ENGLISH KENNEL AFFAIRS.

Editor Forest and Stream:

The bonds that unite our countries rapidly grow larger, firmer and more enduring as the threads of the web are compacted by the weft of mutual interests and pleasures; and sports, in which the dog figures so largely, make no mean show in the weaving.

From what I see in FOREST AND STREAM I conclude that the American Kennel Club has not been very successful in its attempt to get a description of the points of each breed acceptable to a majority and by which these breeds should be judged.

Unaffected by the controversies on the subject, I think the failure to be deplored, for it was evidently a step in the right direction.

Our English Kennel Club took no such action, and the consequence is that the style of dog that wins is ever varying, as different judges give their decisions. To illustrate the chaotic state of things, there are some who judge Gordon setters that will throw a dog out, however good, if he has a speck of white on him, and this at shows under Kennel Club rules, although no edict of the club has ever been issued against white on a specimen of the breed.

Again, a short time ago a poodle dog, admitted to be a very fine specimen of the black corded variety, was ignored—that is, practically disqualified—by a judge because there was a little white on his chest. A short time afterward a new owner exhibited the same dog and took a first prize with him, the white on his chest having disappeared!

Now if there was a publicly recognized rule, sanctioned by the kennel clubs, that no poodle with a white speck on him could win in a class for blacks, no one could complain; but in the absence of that the dog wins or loses, at the whim of the judge.

The result is, men dye their dogs. The result of a clear rule would be that as there are far more black dogs whelped with than without white on the chest, we should soon have classes for the former. It is childish, silly and utterly contemptible to make the honor or condemnation of the philosopher of the canine race depend on the presence or absence of a few white hairs.

But mark the absurdity and inconsistency of conduct of our kennel rulers. The man who got the kennel clubs to disqualify this poodle for being dyed was the Rev. Greenhill Bolton, the owner of the poodle Styx, which a month previously the Kennel Club had published an engraving of, in which the poor beast is represented shaved in a most fantastic manner, and writing of it the Kennel Club's organ tells us the reverend gentleman had purchased the dog at the Brussels show when in a very ragged state, and that after "some hard work" at the dog's coat the dog won at Brighton, and "fresh from the hands of Madame Feilx," Styx took first at the Crystal Palace. This clipped, shaved and pomatumed animal is in that state, says the *Kennel Gazette*, "a thoroughly representative specimen of his breed." It would be as reasonable to say that a clown as he appears in a pantomime is "a thoroughly representative specimen of humanity." To encourage the removal of the natural covering from the loins and other parts of a dog where it is so much needed, and that at the dictation of a vulgar and degraded fashion, is unworthy of a national kennel club. In purely fancy articles, such as toy dogs, no doubt considerable license is to be allowed in the value put on certain arbitrary points, but when these are so overvalued that natural features are effaced, and, as in some breeds, the well-balanced physical development is sacrificed to a craze for some non-essential point, it is evident the authorities should moderate such tendencies to prevent the evil results which follow them; but instead of doing so they practically encourage the breeding of ill-formed and weak constitutioned dogs; and the judges are bound and trammeled by the canons of the fancy, most of the formulators being ignorant of the laws governing animal construction.

Your readers were informed fully concerning the "Brighton incident" by "Lillibullero," and doubtless he has also dilated on the enormity of the "Colley Club incident," which has a far more serious significance than the chaff of one dog dealer by another being turned into a grave charge of dishonesty.

If "Lillibullero" has not done so I will, and perhaps whether or no, for it is not improbable my views of the case and his may be very different except in the stern denunciation of making a charge against named members of a club anonymously.

We have, metaphorically speaking, that which the doctors of the early eighteenth century believed in as a physical fact—hydrophobia in the air. We have had mad dog scares before, but never one that had such a basis of fact to justify it. The statistics of the death register are expected to show one death per week during the present year in London from hydrophobia.

It is about two years since Dr. Roy, of the Brown Institute—where the animals of the poor receive the attention of eminent veterinary surgeons gratis—published a warning of the great increase of rabies in the southwestern district of London, and Mr. A. J. Sewell, a veterinarian whose immense practice is largely with dog ailments, confirmed the warning, and has repeated it from time to time. These warnings and others from persons of less importance went unheeded, until the constantly repeated cases revealed by coroners' inquests, confirmed by the great increase of rabid dogs taken to the "Home for Lost Dogs," amounting to over forty in the first nine months of the year, roused the public to the reality of the danger and stimulated the authorities to action. Action in this matter means the putting in force of certain clauses in an act of Parliament called the dogs act, which clauses ordinarily are in abeyance. This act enables the authorities named in it to order all dogs in their respective districts to be muzzled or confined, and dogs not under the control defined by the order may be seized and after three days, if not claimed, destroyed.

The Chief Commissioner of Police in London has ordered all dogs not led to be muzzled, and he has set apart a number of officers in each district for the special duty of apprehending stray dogs not muzzled or under the control of their masters. These officers are armed with strong leather leggings and gauntlet gloves, and a rod with loops of leather at the end by which to lasso the dog and at the same time keep him at a respectful distance.

The bitter cry of London dogdom rises in wails loud and long in the daily press; every phase of the subject of rabies and hydrophobia is being dealt with, and the amount of ignorance it brings to light is truly astonishing, and proves nothing so clearly as the fact that a majority of the writers require muzzling more than the dogs do, for the former give unmistakable evidence of being rabid, whereas in the case of the dogs it is only a case of grave suspicion.

Scores of men are flogging away at the dead horse spontaneous generation, and some of them with a gravity provoking to the risible faculties demand to know if mad animals only can impart to or create madness in others, where did the first mad dog contract it? That is considered quite a poser by the class of mind that cannot be satisfied with this world without a Mosaic cosmogony to account for it; they won't drink the milk in the cocoanut because they do not know how it got there; they do not deny turkeys are hatched from eggs laid by turkeys, but cling to it that the first turkey must, like Topsy, have "growed" spontaneously, and if one turkey why not flocks of turkeys, argue this logical brotherhood of blockheads.

The gravest mistake made by the general public is the confusion of mind which makes rabies a disease affecting the brain—a brain disease in the same sense as lunacy. Scores of people are every day writing that the irritation of the muzzle and the continement of the dog will drive him mad.

Parallels are drawn between men violently insane and the furious conduct of a mad dog as though they were the same disease. This is doubly evil; it causes dogs excited from fear or ill-usage to be still further cruelly treated and done to death, and frightens those who have been bitten into illness, in which the symptoms of hydrophobia are simulated, and secondly it ignores the truth, one that every dog owner should know, that the early stages of rabies exhibit a benignant disease; the dog may be unusually affectionate, and the fits of petulance he indulges in credited to any but the right cause, and it is during this stage when there is no suspicion of his real state that there is most danger to members of the family that nourish the dog. Rabies is never initiated by a fit of fury; and the fits, in which there is involuntary muscular action, champing of the jaws and frothing at the mouth, to which dogs when teething or suffering from worms, or when greatly excited on game, are so liable, and which are so often accepted as evidence of madness, are in reality clear proof that the dog is not rabid, and on the contrary, perfectly harmless.

We cannot, however, hope to get rid of rabies in this country by stamping it out in a limited district such as the metropolitan area, nor can we in that so long as dogs are freely brought into it, any one of which may have the rabific virus lying latent in him, and which on development will make him a center from which the disease is distributed.

Our rural magistrates and some urban ones regularly put the restrictive clauses of our dogs act into force during the dog days, in the belief that the disease is generated in consequence of the high temperature of that season; I presume your municipal and other authorities are too intelligent to act on such an effete superstition.

The latest crank—but no, I am not happy in the use of American words, I will say craze, is for Welsh terriers. Taffy has discovered that Wales is the home of a hard-coated black and tan terrier, with the distinctive marks of white on the chest and white forefeet. It is a mystery to me that the discovery should not have been made and published to the world before the year 1885.

The claim is disputed by some Englishmen who say the dog is not Welsh, but the genuine and real old original English terrier. This did not prevent the latter exhibiting at Birmingham show their English kennel terriers as Welsh. The class was a very mixed lot, many being little cross-bred curs with soft coats, and that is a very common feature and it is not the great fault that fanciers with little or no experience with working terriers make it out to be; a soft coat is not an index of a soft heart, and many of the most courageous and enduring dogs are soft-coated.

I have have not in this letter said anything about the Birmingham show, as you will have had a full report of it, and for the same reason I will say but little about the St. Bernard show which closed last Friday, Dec. 11. The St. Bernard Club, having been safely towed through some very troubled waters by the tugs Justice and Ability, is sailing along before favoring breezes. This, their fourth annual show, is admitted on all hands as the largest and best yet held, the young dogs (rough-coated) between twelve and eighteen months old being a class of marvellously high quality. The entries numbered 303, divided into twenty-five classes. The catalogues issued by the club are models worth copying, the pedigree of each dog being displayed in tabulated form, rendering it clear even to those people, not few in number, who find genealogies puzzles hard to unravel. This renders these catalogues useful stud books for after reference. A plan long ago advocated by me as well as others, and occasionally adopted in years gone by, that of giving to each person leading a dog in the judging ring a card bearing in bold figures the catalogue number of the dog, was adopted. This enables spectators to identify the dogs, and is of very great assistance to them in comparing merits and forming individual judgments.

Our spirited little doggy paper, the *Stock-Keeper*, calls this "an extremely well devised, useful and practical innovation," but the *Stock-Keeper* is in some things like David Copperfield—very young.

The great success of the show is a credit to the management, and the very large entry—many had to be refused—a high compliment to the judges, Mr. L. C. R. Norris-Elye and Mr. Frederick Graham. The latter gentleman is one of our oldest breeders of St. Bernards, and admittedly one of the best judges of them we have.

I had something to say on the topic of special clubs and special judges, but this letter has spun out more than I expected and I think the subject is quite hot enough to keep warm for a month.

In last copy of FOREST AND STREAM to hand I find a quotation from the Augusta (Ga.) *Chronicle* respecting a marvelous fox hunt lasting ten hours and covering 130 miles. How were the sixty hounds bred? What horses did the Baker county men ride? or did they have a special train? How many of them heard the *mort* sounded? And lastly, Who is the editor of the Augusta (Ga.) *Chronicle*? Has Ananias been resurrected? CORSINCON.

LONDON, Eng., Dec. 11.

THE BIRMINGHAM NATIONAL DOG SHOW.

THE National Dog Show Society held their twenty-sixth annual exhibition in Curzon Hall, Birmingham, this year under Kennel Club rules, with a total entry of 1,053, which is in our opinion about 100 more than the hall can accommodate with anything like comfort or safety. In many cases they were so close together with their chains twisted round each other, that while taking notes we found we were putting our remarks to the wrong number. It was arranged that the judges were to commence their duties at 8 A. M. to have the awards all made by 11:30, when H. R. Highness the Prince of Wales was expected to visit the show. However, the judging was not finished at the time, so that as the public was admitted at 11:30, the judging at Birmingham for the first time was finished publicly. Of course owners were not allowed to lead their own dogs, which was anything but satisfactory to exhibitors, who had to stand at a distance and see their dogs led about before the judge by a keeper who might never have had a dog on a chain before, and in one case a certain bitch was entered in two classes and won first in one and second in the other, and upon being led out and shown for a special for the best of the variety in the show, she, we understand, won the special, but upon the facts being noticed, the award was altered. Her owner was not under the circumstances more than satisfied and had the private judging been carried out, his feelings would not have been affected in the same way, as perhaps he never would have known anything of the matter.

The deerhounds were two very good classes, but we could not agree with the awards. In dogs we considered Clansman much the best in the class. Acalia won well in champion greyhounds. In open dogs first went to a fair black dog, but for quality we fancied Balkis, third prize, with his kennel companion Cassells as good as any of the others. The winner in the bitch class also won the cup, which decision we did not agree with as we considered her about as moderate an animal as any in the class.

Otter hounds were the best collection we have yet seen together.

There was only one entry in beagle dogs, a moderate animal, very heavily marked, and four entries (one absent) in bitches. We liked the commended Myrtle much better than her kennel companion, Abigal.

Fulwood Spark won in champion fox-terrier dogs, but was afterward disqualified, being under weight when competing for the special cup. Mr. Foreman's Farndon Street Sailor was also disqualified, after having a good win in open dogs. Dudley Crash, second, a good terrier, but rather weak in muzzle. Frank, hc., is cheeky and throaty; Crabstick, third, is too heavy in skull; Jack Clinker is a good sort, but too large. In large-sized bitches, Freya, first, was rather thin in coat. Second prize, Westbourne Trellis, is weak before the eye. Rarity is a good sort, but too large. In small-sized champions, Meersbrook Model, looking well and always a favorite of ours, won well. In the open class, small-sized dogs, Randolf is weedy; Fulwood Squire is a good terrier, but thin in coat; Brokenhurst Risk is plain in face; Veni is a good terrier, but weak before the eye; Valet is a good sort, with good head and eye, is of good size, but was shown thin and is a lemon marked one; Spice Dick is rather heavy in skull and too short in head and neck; Mount Trap, unnoticed, is a fair good stamp and should have been noticed; Doric is loaded in neck and shoulders; Raby Trick is leggy and soft in coat. In small-sized bitches the second winner was looking much better than we have seen her lately. The third prize is a very nice lemon-marked bitch. Satellite, unnoticed, is a very good stamp of little terrier, with good head and expression, possessing plenty of bone and good quarters, with the best of feet and legs. Safety, the winner in this class, is a good stamp; she might be better in head and have more expression.

In champion wire-haired terriers, the tight lay between Tack and Wonder. The latter just managed to get first. They are both good ones. Tack has rather the pull for size, but Wonder is a real good one, and always on her legs and showing herself well. In open dogs, Barton Clinker won; he is another good one, possessing character with good feet and legs and a good coat. Raleigh is a very good lemon marked dog, but not shown to the same advantage as the winner. Ronald Broad is too light in eye. Mr. De Trafford was again to the front in wire-haired bitches with Barton Marvel, and won the cup for the best wire-haired terrier in the show, and, we think, rightly. She is lemon marked, and her ear is just large enough, but in size, style and coat she is a marvel. Second prize, Woolaton Thistle, is weedy. In fox-terrier puppies the first is too high on legs and weak in head. Bolt, unnoticed, and claimed at £5, was as good as any, but too fine in coat.

The pointers were a grand collection. Five turned up in the challenge class, and it was a close shave between Nan and Belle of Bow; both are good ones and were shown in the pink of condition. The open dogs introduced us to another new one—Naso of Upton, by Naso of Kipping ex Nan. This young dog won first and special for the best pointer in the show; and, we think, correctly. He was shown without an ounce of fat on him, and we never saw muscle developed to a greater extent on any young dog. He possesses good feet and legs, the best of shoulders, very clean neck, and his quarters are perfection. His head is also good, but we have seen dogs possess more character in head. However, we think his worst point is his eye, which is too light in color. Earl of Croxteth is not so fine in shoulders or long in head as the winner. Devon Sancho made a good second, but is not up to the form of the winner in quality or condition. In large size bitches, we liked the second prize winner. She is full of quality, and possesses more bone than the winner, who was in the best of form and is a good bitch, full of quality. Nannie, sister to Naso of Upton, made a good third. Young Wagg, showing age, won in small-sized champion dogs. In small-sized dogs, Mr. Norrish won well with a very nice one, Bracket, shown in his usual good form. He was closely pressed by Naso of Kipping, another good one, full of quality. Third went to Kingsbridge Bang, showing quality, but very bad in shoulders and weak in quarters; catalogued at £10 and claimed. Dagmar vhc. reserve in small bitches, shows quality, but is rather light in bone. Lady Jane is much the same stamp as the winner in large bitches. Larkspur shows quality, but is rather short in face. Pease is another good bitch, rather long in coat. Arizona is of good stamp, but rather throaty. Pardon is another good one with the same fault. Pointer puppies, bar the winner, were a poor lot. In the class for field trial winners there were twelve entries and a real good collection, the small-sized dog Naso of Kipping winning.

In setters, the class for field trial winners, the Irish setter bitch Wee Kate won, closely pressed by the English Wild Rose. In the challenge class for English setters, first went to Royalty, looking well and in good coat and condition, but too heavy all over. We certainly preferred Sting, although he was not just up to his usual form. In open dogs, Osman VI. is a nice sort of dog. He wants more quality in head and quarters. He was very lucky to get third in such company. Prince Rupert, the winner, we think ought not to have received more than vhc., but he was afterward awarded the special cup for the best in the show. He is only a puppy, and won in the puppy class here. We consider him weak in loins and not good in feet. Royal Gem is of the same stamp as Royal. Tycoon, c., is a good dog and much better than those placed over him. King Ned, the Sheffield winner and about best in the class only received hc. We noticed Sir Wyndham, c., a young dog out of form but a good setter, and sure to render a better account of himself again. In bitches, Mr. Cockerton won first and second with two very good ones. We preferred the second as being younger and showing more quality. Empress Bess is very bad in coat. In the challenge class for black and tan setters, Heath Beauty just beat Czarina. Open dogs were a good class so far as numbers went, but there was not much quality. The winner is a good dog, with plenty of substance. Second went to a strong dog, but coarse. We prefer the third prize winner. In the bitches the winners were finer and of a different stamp from the winners in the dog class.

In the challenge class for Irish setters Loo VII. beat Nellie. We preferred the latter, although she is not so good in skull as the winner, but better in body and bone. In open dogs, the winners were coarse and carried too much coat and feather. We thought Kildare about the best in the class, with more of Irish setter type and character, and at the same time being well made, with good feet and legs, good coat and correct in color. Grouse XIII. is rather thin and light in body, but ought to be further forward. In open bitches, the winner is of good stamp. She is greatly improved in coat and her color is better than at Hull and Sheffield, but she is too small. Wee Kate, second, is well-known. She is a good bitch, just a trifle out at elbows. The third winner is plain in face. Nellie IX., out of coat, was about the best in the class, possessing good head, good ears, and the best of body, feet and legs, with shoulders running in the right direction. In setter puppies, all breeds, first went to the winner in open dog class. Second, a moderate animal, but was claimed at the catalogue price, £30. Monk of Furness, a dog almost white in color, we considered about the best young setter in the show, standing on the best of feet and legs, with good loins, plenty of coat and beautiful head and ears.

In the challenge class for any variety of spaniel, our old friend Solus won, looking as well as we have ever seen him, while at Edinburgh and Hull he was quite out of form; the small, party-colored Fanciful coming second. In water spaniel dogs only two put in an appearance, and The Shaughraun won; but he is coarse and not what a Birmingham winner should be. Only one bitch was entered—a very moderate specimen. Some very nice Clumbers were shown, and we think they were correctly placed. The winners were good, large, well-bodied animals, of very good type. Cherie is a very good bitch, full of quality, but lacked the size and body of the winner. Mr. Holmes's entries were absent. The winner in the Sussex or liver-colored variety was, in our opinion, a clear winner and a good typical spaniel, with good coat and color, with a lot of improvement in him, as he was exhibited here too light in flesh. There was very little to choose between Easten's Bee and Newton Abbot Russet, the latter having the pull in condition, the former being out of coat. In black dogs, Furse is coarse and bad in eye. The winner, Newton Abbot Victor, is a good spaniel, but too high on leg. Darkie, from the same kennel, is lower, but coarse in head. Beverley Rollo is also a little high on the leg and wants more quality in head and shoulders. In black bitches, Flame is a good spaniel, but out of coat. Newton Abbot Bess won well, being good in type and with beautiful ears. Una is small before the eye and her ears are too high, but she was the longest and lowest in the class. In spaniels other than black, first prize went to a coarse, leggy, bad-coated liver and white, the worst in a class of three entries. Counsellor was a good way the best, and this was the only mistake we could see in the spaniel classes. In the corresponding bitch class there was little between Corty and Winifred II. Only one cocker turned up—a very moderate one. The well-known Freda won first in bitches. We understand she was over weight, but as no person protested the awards held good. Second went to the winner at Hull and Sheffield.

Basset hounds were two good classes, and the competition was keen and satisfaction not more than usual under the circumstances.

In mastiffs, Montgomery won for the second time at Birmingham; he is short in face, but too much turned up in bulldog style. Third went to the Sheffield winner, coarse and long in head. Prince was out of condition, but with the best face in the class. A very nice bitch won, Griselda; she is good in skull, but might be squarer in muzzle; she is of good size and good type. Cambrian Princess coming second, with Princess Ida third, to which we preferred the vhc. Vivian.

In the challenge class for St. Bernards, Plinlimmon won, with Lady Eva, from the same kennel, reserve. In open dogs, the much improved Merchant Prince won easy, the Silver King coming second and the well-known Musgrave third. We thought Bernadine won well in bitches, being a very showy bitch, and except that she is a little light in bone, one of the best. Second went to the Duchess of Leeds, a good-bodied bitch, good in size and with the best of feet and legs, her fault being a trifle too much length in face. Crevassee II. made a good third.

Champion Rutland, looking well, won in the challenge class for sheep dogs, yet we preferred Charlemagne. The open dog class was not so good as we have seen at Birmingham. We consider Claudian only a moderate dog, and prefer Blister, from the same kennel. He possesses a good head and well-carried ears, and is of good size. Angus Craig is a good collie, but carries his tail too gaily. Rankin got more than he deserved. Oakham Fifth is as good as any in the class, although one ear is not correctly carried. In bitches, Easemore is of a good stamp, but small, possessing good ears and coat. The black and white Sweet Lassie we admired very much. She looks like galloping and possesses good head and ears and good coat Mint is short in face. Blue Ruin, looking well, won, and has been often noticed; second a good way behind the winner. The puppy class was large and contained some very promising youngsters, but the majority were very moderate.

Rustic King won easily in bulldogs, Grabber being absent. The open class was moderate. Mr. Layton showed a very nice small dog, by Monarch, and won well in the small-sized class.

Cairo won in the challenge class for bull-terriers easy, having nothing against him. In open dogs first went to Trenthan Dutch, a good large dog, coarse in head; Paradox shows quality; King Dick II. is cheeky; Neville was badly treated, and so were several other good dogs unnoticed. Queen of the May won easily in bitches and we considered her about the best bull-terrier in the show; second went to a very nice medium-sized bitch, and we fancied Kettering Maggie as about the next best. In small-sized dogs first went to a young one; his sister won in small bitches and beat her brother for a special; they were both young, being under twelve months old, and will be sure to alter. Leading star won easily in white English dogs; a very fair young bitch winning in the bitch class.

In the challenge class for black and tans Wheel of Fortune just beat Burke, the latter was shown too fat. The winner in open dogs was a youngster that looks like growing too large; Hero made a good second and might have won altogether. Kenwood Queen had nothing against her in bitches. In small-sized dogs the winner is too fine and bitchy, the others were too young. The small class bitches were a good class and contained a number of good ones. We preferred the second to the first.

Prince Charlie II., well known in Scotland, won well in prick-eared Skyes, and Claret, that we have not seen for so long a while, won in bitches. In Skyes, other than prick-eared, Maggie is short in face, but good in coat. Benmore, rather light in color, won easy. Strathmore is too large and out of form. Kirkwood had nothing against her. She is a good bitch and well-known. Dandie dogs were a good class. Border King winning well, we preferred Rhoderick for second place. Pepper is a good dandie, but light in color. Cairngorman is young and small in skull. Jennie Deans won again in bitches. In Bedlingtons, we preferred Hairdresser to the Bishop. Only two turned up in open dogs, Scotch Mist winning easy, the other was a liver. In bitches the winner shows style. Clyde, unnoticed, was good in style and size, but we did not like her coat.

Play Boy had a walkover in the challenge class for Irish terriers, only three dogs were entered, the winner a good way ahead. Greymont being shown in bad form. Mr. Graves won easily with Pretty Lass in bitches, and in the uncropped division we liked Nora Tatters, bar her size, as well as any. Airedales were moderate, but the winners were well placed.

In Scotch terrier dogs, Dundee won well and we preferred Tyrant for second honors, being nice in size and good in coat. We preferred Ashley Nettle to the winner in the bitch class, the latter being best in skull, while the former was much the best in coat. Welsh terriers were a very poor lot. Mrs. Foster won first and second easily in Yorkshire terriers. Pomeranians first and second went to two small blacks; the white, Charley, was only vhc.

The winner in poodles was a grand dog, shown naturally.

Pugs were a good collection, but we fancied that some of the unnoticed were as good as any in the class—for instance, Lion, Gaiety and King of Diamonds—while the third class dog was very plain.

In Maltese there was only one, and it very moderate, and marked on ear and tail.

In the challenge class for toy spaniels, Bend'or and Jumbo II. had a walkover, and we considered them correctly placed.

Blenheims were the best class of toy spaniels, with very little to choose between the winners. Only two King Charlies—the winner much the best.

Mr. Alf George won in smooth toys with a very good one, while Mrs. Foster won first and second easy with a pair of good Yorkshires in rough toys.

The attendance during the show was better than we remember, and Birmingham shows have always been well patronized. During the show there was a petition drawn up by some exhibitors to present to the committee in favor of private judging.

MAHARG.

[A list of the awards will be found in the *American Kennel Register*.]

THE NEW ENGLISH SETTER STANDARD.

Editor Forest and Stream:

Several weeks have passed since the publication of the proposed new English setter standard. The paper is signed by eminent authority, and, for this reason perhaps, is already accepted without criticism by the majority of setter breeders. When offering the following remarks I likewise decline to criticize, but ask for elucidation of doubtful or not well-expressed language.

If one knows the dog the framers of the standard have in their mind, or if the description were accompanied by a few drawings, there is no doubt that the best exponent of the modern English setter can be brought within the meaning of the words as used, even by others.

My objection to Stonehenge's standard, even in regard to the dog to which it applies, is that it is too broad for all but the direct pupils of its writer, who have received the proper interpretation from him. As a result, forms of the most radical variation are often placed as under the standard in good faith, and to avoid this as much as possible under the new standard, all the information we can possibly obtain now should prove of advantage.

But before I touch upon any special points, I must have the admission from the framers that what they offer is not merely a new description of the same dog described in the old standard, but that they actually wish to describe a different and improved dog. This granted, I offer you a few pen pictures, poor enough to be classed as caricatures; but like these, intended to illustrate by exaggeration either the strongest or the weakest points of the subject. As I do not expect any of your readers to recognize the dogs from these illustrations as intended—the first (A) for Laverack's Blue Dash and the second (B) for Count Noble's son Gath, clipped of all feathering, as near as I can recollect him from the field trials of 1883—I herewith offer their names to the public and my skill to the ridicule of friend Tracy. As they are, I hope that they will illustrate my meaning when referred to hereafter, and that all defects in the drawing will be excused. (My own impression is, though, that my attempt at Gath is shorter in loin and with less drop from hip to stern than the dog really had.) The first and general questions I wish to ask are:

a. Were dogs of the type of Blue Dash admissible under the old standard?

b. Is his type admissible under the new standard?

c. Was the type of Gath contemplated under the old?

d. Is his type contemplated under the new standard?

After a careful comparison my own conclusions lead me to answer Yes as to the questions *a* and *d*, but No to *b* and *c*. If I am right, wherein lies the difference?

In general, the new standard requires a lighter dog throughout, stating, when speaking of the head, "this type is desirable, since it is in accord with the general type of the dog, the demand being for more length and less weight throughout." Although I am in harmony with this proposition, I should be glad to have a definite desirable weight given or an expression used admitting of dogs like Plantagenet, Sportsman, Gladstone's Boy, Buckcllew, etc., upon the bench.

If I may define "quality" as standing for "the greatest strength in the least weight," there is no reason why dogs of a weight within certain limits should not be as handsome or as desirable for stud purposes as smaller ones, provided they have the requisite lightness, are free from lumber and full of "quality."

Beyond this indefinite expression of weight, nothing is said in either standard as to size, length or height, but I take it as an axiom that (with a given size) the lighter a dog looks for his weight, the better is his weight distributed and the greater his quality. Long flat muscles, though lighter in appearance, are preferable to shorter ones. But longer muscles require longer bone for attachment, hence, "more leg" and the abandonment of the low spaniel type of Dash for this reason alone.

But this is not the principal distinction. Leggy dogs have always existed without being an improvement in either looks or action. Wherein, then, is the improvement? Legs or feet are described in the new standard as understood heretofore, and I have only to add that, in my opinion, no naked foot should ever be a harefoot; furthermore, a harefoot requires a sloping pastern.

Nearly everything else, although more explicit in the new standard, is descriptive of practically the same demands as in the old, even to the indefinite description of "thin enough, wide enough," etc., until we come to an expression incorporating almost the only radical change in conformation—a change which, with the subsidiary changes it necessitates, is the fundamental principle of the new type.

I quote the following from the description of shoulders and chest:

"The chest should be thin enough to allow the shoulders to lay flat and move with freedom. Great depth at this point is objectionable, since it puts too much weight on the shoulders and forelegs. The weight should be distributed as evenly as possible between the forward and hindparts; the tendency is too much forward. By placing the greater volume of chest back of the shoulders the foreparts are relieved of weight that should be in part supported by the hind parts. The droop in the chest should be just back of the elbows, sloping upward toward the neck, permitting the dog to carry his head and neck up with more ease."

We have hitherto heard a great deal in regard to depth of chest and its dropping below the elbow; its being thin enough, ribs well sprung behind the shoulders, deep in back ribs, etc.; but this is for the first time that I have seen its relative position described as above in the words: "The droop in the chest should be just back of the elbows, sloping upward toward the neck." Of course I take this as describing the position of the breastbone, to which the full or true ribs are

attached, and as these run upward and backward to the spine, a sufficient length of ribs and measurement (avoiding the expression depth) of chest can only be obtained, with this position of the breastbone, by an equal and early rise of the spine from back of the top of the shoulders, with a graceful curve into the neck. What the chest loses in depth it should gain in height, sacrificing none of its volume, girth or measurement. Whether this conformation of the spine is secondary to that of the position of the breastbone, or whether the reverse is the truth, appears to me unimportant, though I should prefer to describe the spine first and the position of the breastbone as a resultant.

To give full expression to my conception I here insert sketches of the chest conformation of Dash and Gath—A′ and B′. The radical distinction between the two is in the rise of spine, that of the former evolving abruptly from a level back, from in front of the top of shoulders, and in the latter from behind the shoulders. This apparently unimportant requisite does, nevertheless, carry with it almost every other feature involved. The entire chest receives a partial evolution, the breastbone tilts forward and upward, and the ribs, instead of simply downward, slope downward and forward from spine to breastbone. Further, as the shoulder blade, whether long or short, is attached to exactly the same ribs in every dog, its position and slope depends entirely upon the slope of the ribs underneath.

Furthermore, inasmuch as the three upper bones of the forelegs, viz, the shoulder blade, the upper and the lower arm, are placed at compensating angles to each other, the greater slope of shoulder naturally resulting from the altered direction of the true ribs also necessitates a less inverse angle at the elbow. The dog stands straighter on his forelegs from point of shoulder to foot and carries no more weight in front of the perpendicular line of his forelegs than is necessary; how much this is I am at a loss to define, except after seeing an individual dog's balance when in motion. This conformation also increases the apparent length of the neck and facilitates its high carriage. Length of neck alone does not do this, as I can recall many dogs with a very long clean neck, but with a horizontal back, to whose bad field form but little would have been added by cutting it off altogether.

I have given the above personal views simply for the purpose of elucidating the few questions I wish to ask of the framers of the standard, with whom I think it is clear that I am in almost entire harmony as to results, if not as to causes.

As I have explained, I regard the paragraph relating to shoulders and chest as involving the most important change; and it is right here where I ask for information. The older spaniel form of the setter was hung too low in the brisket, and too much of the dog was in front of his forelegs; there was as much inverse crook to the elbow as there was converse crook to the stifle. The whole dog was hung low, and more than half was hung in the elbows. The part of this paragraph already quoted appears to do away with this, stating that "great depth at this point [chest] is objectionable, since it puts too much weight on the shoulders and forelegs." And I might here add, "and as it causes the dog in his gallop to dwell too long on his forelegs before taking them off the ground." The standard further requires relief of the fore end "by placing the greater volume of chest behind the shoulders."

As I agree to all this I am obliged to ask for a measurable degree of the angle required "to bring the forelegs well under the dog," as described in the first sentence of the same paragraph.

Is anything short of stiltiness, avoiding the perpendicular line from point of shoulder to toe, enough? or is a straight line from point of shoulder to toe sufficient as long as its direction places the feet well under the body? or lastly, is more or less of an inverse angle between the upper and lower arm required at the elbow to withstand any shock, regardless of the increased slope of the shoulder? Are the forelegs in the sketch properly placed or too straight?

The dog is often compared to the race horse, and although they have much in common, a flat racer offers but a poor comparison, as a hunting dog is a much better steeplechaser than any horse that ever won the Grand National. In proportion to his size the most ordinary hunting ground offers obstacles at almost every stride, and that for days, greater than any horse has ever to overcome for a race lasting but a few minutes. Liberty and elasticity in every part of his locomotive organs, an untiring balance in his working gallop, but not the essentials of a short-coursed greyhound or race horse, are the requisites of the hunting dog. His action should move the body as little up and down as consistent with the ground he runs over; the legs should work as much forward of their own perpendicular line as possible, the feet striking the ground well forward and on their soles, reducing the chances of stumbling. As the hindleg is provided with a good bend in stifle and large crook in hock, they also are well adapted to the required forward action, and I regard a dog which extends the hindleg too far backward when galloping as faulty in conformation, the fault being often found in a weak or flat loin.

I have but one more point to refer to.

The paragraph describing quarters and stifles, calls in one line for stifles "well bent." In the next line it says, "a little bow at stifles is a point of merit," etc. I take it that the "bend" is to be observed in the side view and the "bow" in the rear view, meaning "stifles spread to clear the body, but not to an extent to cause cowhocks."

Am I right in this?

ANTWERP.

THE JESSICA WHELPS.—Memphis, Jan. 3.—*Editor Forest and Stream:* In your issue of Dec. 31 I notice in "Names Claimed" and "Whelps" that Mr. J. J. Prentiss, of Chicago, Ill., claims certain names and publishes the whelping of puppies by my dog Paul Gladstone, out of Jessica (Count Noble—Nellie). These same puppies were advertised for sale by the Lake Shore Kennels some months ago. I immediately wrote to those kennels that if these puppies were not killed I should give the facts concerning them to the public, which would place those kennels in a very unsavory light. The advertisement was withdrawn, with the promise that the puppies should be killed. You can, then, imagine my surprise in reading the notice in your paper. Mr. Prentiss was perfectly aware of the facts connected with these puppies, and also of my letter to the Lake Shore Kennels. The facts in the case are as follows: I had arranged with Mr. Prentiss—not the Lake Shore Kennels—to let Paul Gladstone serve Jessica when she should come in season. Both were at the Chicago show last June; Jessica was in season, got loose from her stall and was served by a liver or orange and white setter of no known pedigree; preventive measures were taken, so they say, with water, and the next day she was served by Paul Gladstone. I was not notified of what had happened till I received a letter from Mr. Prentiss and the return here of the gentleman that had Paul in charge, or I should not, under any circumstances, have allowed Paul to serve her. I feel it my duty to give these facts to the public, and shall protest the breeding of these puppies to the bitter end. I cannot understand how any persons or kennels valuing their reputation could claim puppies as purely bred under such circumstances. —W. B. GATES.

YORKSHIRE TERRIERS.—*Editor Forest and Stream:* Is white on the breast of a Yorkshire terrier admissible? I have always rejected one with it. I have Vero Shaw's book, also Stonehenge, neither of whom say anything regarding it. Is there any work which gives the colors admissible for show dogs?—R. S. RYAN. [There are blue and tan and silver Yorkshire terriers. White is not admissible on the former but would not detract from the value of the latter].

THE GRAPHIC CHALLENGE.

Editor Forest and Stream:

As Mr. Anthony "declines to discuss through the columns of FOREST AND STREAM or any other paper any question affecting dogs, field trials or bench shows with any professional dog dealer or handler," I would like to ask if any of the gentlemen present saw Graphic when he was "quartering out the whole ground in front of Beaufort on the right?" Would it be like Mitchell to bring his dog back when he was quartering his ground ahead of his competitor, especially when one part of the field was as likely to hold birds as the other? He cast him to the left for the simple reason that Beaufort was ahead at that time and would certainly work out the stubble to the right ahead of him. It was proved that Mitchell was right in casting him to the left as (unfortunately for Graphic) that was where the birds were. I would not have taken the trouble to write this had not Mr. Anthony made the statement after refusing to discuss anything with a handler. As if the columns of the "FOREST AND STREAM or any other paper" are not as free for a man who is not wealthy and has had experience with "dogs, field trials and bench shows" as they are for one who is wealthy and has not had that experience. I do not think that being a handler should debar a man from discussing any question with Mr. Anthony any more than it should prevent a man from being a gentleman.

After reading the one-sided challenge to Mainspring, Croxteth and Drake and bringing to mind the sale of Graphic for several times what he cost, I made up my mind that as an amateur dog dealer the debut of Mr. Anthony had been, to say the least, brilliant, and wondered how long before he would be considered a professional. W. TALLMAN.

TARRYTOWN, N. Y.

Editor Forest and Stream:

In my letter relating to this question I wrote "his ring-tail included." This is a mistake, as Graphic has a corkscrew tail. Mr. Green informs me that he has not seen Graphic, and that what he said to me was the opinion of a friend who has seen the dog. CHAS. H. MASON.

THE POINTER CHALLENGES.

THE following reply has been made by Mr. Perkins to the challenge published a fortnight ago:

Messrs. Chas. Heath and Jas. L. Anthony, New York: Dear Sirs—If you are really desirous of running your dog Graphic against Mainspring for a purse, a cup, or a dog collar, you shall be accommodated, though not exactly upon the conditions you name.

I fully recognize the fact that in this match Graphic has all to gain and nothing to lose; yet I promise you as fair a race in all its details as I can possibly give you and yet be fair to my dog.

If your object is the advertising of Graphic through the editorial columns of the newspapers, I must positively decline having anything to do with the matter, and one condition I must name right now is, that all particulars regarding this race shall be kept out of the newspapers; from this time until day of the race, unless such paper be signed by both you and I.

My office is but a short distance from yours, a letter would have reached me by messenger in half an hour or by mail in a few hours, or you could have called upon me. I would have considered it courtesy on your part had you notified me of your desire before advertising your challenge, which is liable to provoke discussion to an unlimited extent. I must therefore positively refuse to take any part in any newspaper discussion on this subject that may hereafter appear.

The details of the race can, I think, be easily arranged, and the sooner we get at them the better. I therefore await your pleasure. A note addressed as below will meet with the desired attention, but newspaper articles will not be noticed.

I am not a member of the Eastern Field Trials Club, Westminster or other kennel club, and have but slight acquaintance among its members. Had I the time to devote to the interests of those organizations I most certainly would endeavor to become a member of both clubs.

As it is, Mainspring was entered in 1884 and '85, and run for what he was worth in the opinion of the judges, whose decision I agreed to abide by when I entered my dog. It was so at the National this year, and though greatly disappointed by their decision, yet no newspaper complaint from me.

The honors conferred upon Mainspring in 1884 and '85 were won by him His grandsire champion Bang won many before him, and his sire Mike won nine field trials more than any dog ever won in England. His dam and grand dam, also several of his sisters, are noted field trial winners, and last year a puppy, Osborne Ale, by one of Mainspring's litter sisters, won the English Derby.

If Graphic beats Mainspring, and I promise to give him as fair play as I ask myself in the details of the race, his owners can feel it a triumph well worth a great effort to accomplish.

J. F. PERKINS.

KENT AVE. AND HOOPER STREET, Brooklyn, E. D., N. Y., Jan. 7, 1886.

THE SURVIVAL OF THE FITTEST.

Editor Forest and Stream:

During the month of November last, Mr. W. Wade wrote an article to the *Stock-Keeper*, in which the following paragraph occurred:

"May I express satisfaction at 'Corsincon's' vigorous denunciation of the silliness of disfiguring so excellent a dog as the poodle by the stupid fashion of clipping, making one of the wisest of dogs look like a clown at a fair? That such a philosopher should be made to look as big a fool as his barber is a disgrace to canineology. You have clubs for almost every breed, useful, useless and mixed; why not get up one for poodles, the general utility dog? If we were to have but one breed, surely the poodle would be the one entitled to survive. Surely he is better worth a club than those incarnate devils, boarhounds."

Knowing Mr. Wade's love and admiration for the mastiff, I wrote and inquired why this apparent neglect of our favorite breed. He immediately answered in his usual entertaining style, and with his permission I give his reasons herewith:

"I fully expected some mastiff man to pick me up on that poodle business. Yet, I am sure I am philosophically right on it, and am none the less a mastiff man. Remember, I spoke of the poodle as 'the general utility dog,' and it is on this ground that I say, if but one breed was to survive, it should be the poodle, for there is nothing that dogs are used for (except high speed) that the poodle will not readily adapt himself to. He is used in Germany to point game, is naturally and instinctively a retriever, a vermin killer and a watch dog, and could easily be trained to handle stock. He may not be as good a bird dog as a setter or pointer, as good a vermin dog as a terrier, as good a watch dog as a mastiff, or as good a sheep dog as a collie or a bobtail, yet he would fill any place better than any other dog whose specialty it is not, and by selection and breeding a strain of poodles could be established in whom these characteristics would be hereditary. I don't think this can be said of any other dog, so I cannot see any escape from my conclusions. The poodle's intelligence is far more general than that of any other dog; that of the setter or pointer is only marked in hunting, that of the collie in stock tending, and the mastiff hardly seems to have any outside the domain of watching and guarding. I have seen rats run under the nose of my mastiffs, and they seem to have not the remotest intention of following them, while cattle can run over my garden, through my cornfield and over my lawn, and not a whit does Lion or Bertha care, but let a man come on the place and they are alert in an instant. * * * —W. WADE."

The poodle would most readily make the best "general utility dog," being the easiest taught. I firmly believe, however, that with time and intelligent attention dogs could be taught to do anything—the failure to teach I would set down to the stupidity of the master, and not the lack of intelligence on the part of the dog. V. M. H.

LIABILITY FOR A DOG'S BITE.

SOME of the well known principles of law, relating to liability for a dog's bite, were rehearsed by Chief Justice McAdam, of the City Court, New York, Dec. 26. The case, as reported in the New York *Times*, was that of Bridget Laherty against James Hogan, both of whom dwell in a large east side tenement house. Hogan had a son who was not of age, and the son had a pet dog which he kept at home. Bridget Laherty in her work about the halls of the tenement, came across the dog, and for some reason they did not take kindly to one another. The dog got in first, however, and bit Bridget, causing not only a disagreeable sore, but fears of something more dangerous. Therefore Bridget began a suit in the City Court against Hogan for damages, claiming that the dog was vicious and a nuisance. The jury gave a verdict for Bridget, and the case was carried up to General Term. In his opinion, concurred in by Judge Hall, Judge McAdams reverses the decision and orders a new trial.

Judge McAdam says: "The theory on which the plaintiff sought to hold the defendant was that, while the dog was not his, he maintained it because he allowed his son, who lived with him, to keep the dog about the premises. Assuming that the defendant is liable on this theory, he was certainly not liable in the absence of knowledge of the animal's wicked propensities. The dog was not of the species that are naturally savage and dangerous, and the defendant had a right to assume, in the absence of knowledge or notice to the contrary, that the animal was kind and of good character. There was no evidence that the defendant knew of any propensity on the part of the dog to bite mankind. There was no duty imposed on the owner of a dog to ascertain character before he became acquainted with it. Its character was presumed to be good until the contrary was shown. The plaintiff should prove the knowledge of the owner and keeper of the vicious tendencies of the animal, if it be of a domestic nature, and to charge the defendant he must be shown to have knowledge that the animal was inclined to do the particular kind of mischief that had been done. Satisfactory proof of a single instance of the dog biting mankind previously to the case complained of and of the defendant's knowledge thereof would be sufficient." Judge McAdam refers to the case of Fleming against Orr, in which Lord Cockburn said, in reference to an action for a dog worrying sheep, that "every dog is entitled to one worry." The same rule would seem to apply to mankind. Every dog was entitled to one bite and every bull to one gore before the owner or keeper could be made liable for the results of such tricks on the part of the animals.

The court continues: "The dog was not a trespasser in the present instance; he was on the premises of his owner, and there by the permission of the janitor of the building as well. As to the policy and propriety of keeping dogs in tenements and allowing them to play in the yards thereof it is not necessary for us to advise, for so long as the owner is allowed to keep them there they are not trespassers. This dog has been kept about this same tenement for a long time prior to the injury complained of. The occupants had the same means of ascertaining its character that the defendant had, and yet no one seems to have complained of the animal's habits. The plaintiff contends that an idle dog is a nuisance, and that the defendant is liable on the theory of maintaining a nuisance. We cannot subscribe to this as a legal proposition. Many people may believe that idle dogs are nuisances. But they are not necessarily so in a legal sense. An idle man may be a vagrant, but it does not follow that all idle men are vagrants. Some idle dogs may be nuisances, but it does not follow that all are. * * * Mad dogs or dogs reasonably suspected of having been bitten by a rabid animal are nuisances, and may be killed by any person, if at large, or off of the owners premises. Dogs accustomed to bark at night and disturb the neighborhood by their noise are nuisances, and may be killed by any person annoyed thereby. When a dog is ferocious and attacks persons he may be killed as a nuisance.

"The proof does not bring the defendant's dog within either of these definitions, so that we find no legal significance in the suggestion that defendant is liable for keeping and maintaining a nuisance. In short, the plaintiff's case must stand or fall by the old rule that in order to recover scienter must be alleged and proved, and for the failure to give such proof and the error of the trial Judge in charging that scienter might be implied by the affluixon of time the judgment must be reversed and a new trial ordered, with costs to the appellant to abide the event."

FANCIERS' FALLACIES.

MUTILATIONS.

IN dealing with this subject it is my desire to approach it in a fair and practical manner, on the one hand not rushing blindly into the arms of those who maintain the acts I shall discuss are done out of pure wanton cruelty, and on the other not sparing those who do them for mere fashion or appearance, without contemplating the pain or mutilation the animals suffer. In the first place I will take the cropping of ears. This is usually accomplished when a puppy is four to six months old; the ear being sliced off by a sharp knife, the remaining portion is then moulded on cardboard, and pulled up by the hand daily to get the required shape. There is still a worse practice with some, namely, cutting away the hairs at the external canal. We have here not merely cruelty, but the hearing and even the life of the dog jeopardized by taking away one of the principal protections for the delicate and complicated internal auditory apparatus. Among foxhounds and harriers it is customary to round the ear. This is done I am informed, by scissors or instrument made for the purpose, and Mr. Buckland relates that the necessary piece is sometimes chopped off on a block with a chisel and the blow of a mallet. He goes on to state, after the first ear has been rounded in this manner, it is with some difficulty you get the creature to come up and have the second operated on. Let us consider the probable reasons. The ear is removed in fighting, so as not to present a hold for an adversary; as fighting is illegal, this reason may be dismissed at once. Secondly, in some sporting dogs the ears are rounded to save them from being torn when in pursuit of game. This appears reasonable enough, but I am told that one pack at least hunts with the ears as nature fashioned them, and that the master of the hounds has no cause to regret it. Even if it is necessary, there is at least this consolation, that the operation is not attended by the many after-cruelties that accompany the cropping of ears of other dogs. Thirdly, the ear is mutilated for mere fashion or custom. This is simply degrading, when we consider the accompanying penalties. Fourthly, to prevent disease in the ear: this is absurd, and where the hairs referred to above are cut away presents a source of disease. To sum up, then, it appears to me that the practice of *cropping* the ears is as utterly useless as it is cruel, and is done at an age when a dog can appreciate and remember the pain occasioned.

Now, as to docking of tails. This is done when the puppy is only a few days old, and is easily effected by knife, teeth, or even by fingers alone; the pain caused is practically nil, and it is completed at an age when memory is short. The reasons for removing the tail seem to be first to get rid of a member that may be an impediment in hunting; secondly, for appearance, and thirdly, as a prophylactic against certain diseases. The last need only be mentioned to show its extravagance. As regards appearance, I cannot help thinking it does improve some dogs, and certainly in spaniels it is a member which would be much in the way if allowed to remain.

While on this subject I should like to say a word for some young dogs who curl their tails up in the show ring when they ought to keep them down. I have seen many dogs rejected for this reason, who under ordinary circumstances carry them in the orthodox manner; and the reason is easy to find, when we consider that the animals have been chained up for hours on their bed without relief; the presence of other dogs and bitches will also cause them to up-rise the tail. I am sure that many who bear their tails so well in the ring have been subjected to many a blow in their preparation for the show. It may also be interesting to note that only domesticated animals have curled tails.

The next mutilation I shall mention is the clipping of poodles. The actual operation need not be discussed; the reason is fashion. The special point to which I wish to refer is the deprivation of coat from that part of the body—namely, loins and abdomen—which is most amenable to cold and differences of temperature. This may not matter in an equable and mild climate, but in our own country it seems unkind to take away the dog's natural covering, and I am assured the fairer sex, at any rate, if this were pointed out to them, would forego the pleasure of this fantastic trimming for the cold winter months at least.—*Hakim in the Stock-Keeper.*

THE IRISH SETTER SPECIAL.—*Editor Forest and Stream:* In compliance with the request of Mr. T. M. Aldrich to answer through your columns certain questions about the Irish Setter Special, I shall now go through the ordeal, and I hope that my answers will be suggestive of some questions which may be answered by Mr. Aldrich, or any one interested in the advancement of the Irish setter as a field dog in a practical way. Mr. Wm. Dunphy of Peekskill, N. Y., and Dr. Jarvis of Claremont, N. H., are the gentlemen who entrusted me with the prize in question, and not Mr. Aldrich. If either of those gentlemen doubt my integrity or wisdom in the distribution of their money, I shall be most happy to give them an account of my conduct. Mr. Aldrich had made no personal sacrifice in the matter and was practically only interested in the winning of the money, therefore I would not expect impartial opinions in the matter from him, nor should he expect me to answer a question that does not seem to me to be pertinent. If Mr. Aldrich or the owner of Blarney want to have anything to say about the manner of giving an Irish special, let them "come down with the dust" as an evidence of good faith, and then they have a right to "put in their oar." I gave part of it to the Derby, first, because an Irish setter ran there whose work was as creditable as any work done by Irish setters in the free for all; second, because, although the nominations had closed in the Derby, before the prize was offered, the entries had not filled; third, because the gentlemen whose advice I sought in the matter thought that the Derby should be considered; and although I at first thought that Derby dogs should not be considered, I changed my mind afterward. The only reason I saw at any time for excluding Derby dogs was the difficulty of judging in separate stakes; and when it became evident that the difficulty existed anyhow, I had no excuse whatever for leaving out the puppies. Mr. J. O. Donner had just the same right to decide the Irish special that Mr. White had to request him to do so; but Mr. Donner's "decision" was not given officially or in the capacity of a judge at all; it was simply a kindly advice which I accepted as a decision; and my action in so doing received the approval of two other gentlemen who were judges at the Eastern field trials. Before Mr. Donner even consented to advise me in the matter he informed me that the E. F. T. Club should not be held responsible for the disposition of the prize, and I urged that I merely wanted him to give me his private judgment as he had done in other cases. He then advised that the prize be disposed of by running separate heats, but Mr. Aldrich would not agree to this, therefore I had no other alternative but to seek advice from capable, disinterested and honorable people, which advice I acted upon as a decision, and I doubt that it would have been questioned had the full amount been awarded to Blarney. The position is awkard indeed, particularly as I have already on hand all the writing I can attend to, and find it impossible to spare time to discuss the matter with Mr. Aldrich, much less to convince him that I did not divide Mr. Clarke's money. There is no doubt that the Irish Setter Club will act in time in future and get this special in through the E. F. T. Club in their regular way.—L. W. WHITE.

THE DOG COLLAR TRADE.—The business now known as the Medford Fancy Goods Co., was started by Mr. I. Bremer in 1880 at Medford, Mass., with a capital of about $10. In 1882 his business had grown beyond his capital and he removed to New York and formed a stock company with a capital of $10,000. They opened at 309 Broadway, and have since occupied stores at 91 Duane street 96 Duane street, and 101 Chambers street, each time being compelled to remove to increase facilities. Their last move has been to organize a company with a capital of $40,000 and to open a store at 707 Broadway, on the ground floor, which will be elegantly fitted up for the proper display of their numerous designs. The wonderful growth of this business is shown by the fact that six years ago there were hardly $4,000 worth of dog collars in the country, and all that were here, were imported goods. When they first started, they made twenty different styles of collars, now they have over three thousand styles for dogs of every size or breed, besides manufacturing everything in the dog furnishing line, which will add to their comfort or adornment. Their goods are handled by the trade from Portland, Me., to Portland, Oregon, etc.

A BROKEN BARGAIN.—Boston, Dec. 21.—*Editor Forest and Stream:* I am the owner of a bull-terrier dog thought to be of some considerable value. A few months ago Mr. E. B. Wood, of this city, came to me for his services, which I told him he could have (if his bitch was satisfactory to me) by giving me choice of pups. This was well understood and agreed to by him. There were two males only in the litter—No. 1 the image of the father, No. 2 not at all like the other and with marks I judged a throw-back to a previous litter. I saw the pups three times before they were five weeks old and told Mr. Wood I should take No. 1, which he well understood. On going to get the pup at five weeks old, he coolly informed me that he had disposed of No. 1 and I could take No. 2 or nothing. Will you kindly inform me through your columns if I have any redress? Can I claim the ownership of this pup if found?—F. C. HAMILTON. [It is customary for gentlemen to carry out agreements of this kind. Our correspondent should consult a lawyer and reclaim the dog if possible.]

THE HARTFORD (CONN.) KENNEL CLUB.—*Editor Forest and Stream:* At a meeting held Jan. 5 this club elected the following officers: Wm. L. Matson, President; E. Knight Sperry, Vice-President; A. C. Collins, Secretary; J. A. Butler, Jr., Treasurer. Board of Managers—Atwood Collins, D. W. C. Skilton, Henry T. Sperry, Joseph G. Lane, Robert G. Griffing, Joseph K. Lanman, W. B. Nelson, E. K. Sperry, A. C. Collins, J. A. Butler, Jr.—A. C. COLLINS, Secretary (Hartford, Conn., Jan. 6).

THE NEW HAVEN KENNEL CLUB.—New Haven, Conn., Jan. 7, 1885.—*Editor Forest and Stream:* At the annual meeting of the New Haven Kennel Club, held Wednesday, Jan. 6, the following officers were elected: President, G. Edward Osborn; Vice-President, James A. Howarth; Secretary, S. R. Hemingway; Treasurer, L. L. Morgan.—S. R. HEMINGWAY, Secretary.

THE NEWARK DOG SHOW.—Jersey City, Jan. 8,, 1886.—*Editor Forest and Stream:* The following gentlemen have kindly consented to act as judges at the Newark bench show in March: Mr. J. F. Kirk, Toronto, Canada, collies, foxhounds, wire-haired, Irish, Skye, Scotch, Bedlington and black and tan terriers, beagles, dachshunde and Dandie Dinmonts; Mr. H. W. Smith, Worcester, Mass., dearhounds and greyhounds; Mr. Edward Dudley, Camden, N. J., mastiffs, St. Bernards. Newfoundlands and Great Danes; Mr. A. Clinton Wilmerding, Bergen Point, N. J., spaniels. The premium list is now in the printer's hands, and is one of the most liberal that has ever been issued. The total sum of the premiums is about $1,900. In champion large dogs, pointers, setters, collies and spaniels, the prizes are $20, and in the open classes $15, $10 and $5. In other champion classes the prizes are $15 and in the open classes $10 and $5. There will be a class for Caniche poodles. Great interest seems to be felt throughout the country in this show, and the prospects are that it will be very successful.—A. P. VREDENBURGH, Secretary.

NATIONAL ASSOCIATION OF FIELD TRIAL HANDLERS.—*Editor Forest and Stream:* At the annual meeting of the National Association of Field Trial Handlers, held at Grand Junction, Tenn., during the trials, the following officers were elected for the coming year: President, Joseph H. Dew, Columbia, Tenn.; Vice-President, W. B. Stafford, Trenton, Tenn.; Secretary and Treasurer, Bernard Waters, Lamar, Miss. Executive Committee, D. E. Ross, Lawrenceburg, Tenn.; Capt. C. E. McMurdo, Charlotteville, Va.; H. M. Short, Middleton, Tenn.; Joseph H. Dew, Columbia, Tenn., and B. M. Stephenson, La Grange, Tenn. The constitution and by-laws were repealed and J. M. Avent, N. Rowe, H. M. Short, B. Waters and Jos. H. Dew, were appointed a committee to report a new constitution and by-laws. It was voted that it was the sense of the meeting that $150 should be the price for training a dog. There was a large attendance and several new members were voted in.—HANDLER.

A REWARD has been offered by the New Jersey Kennel and Field Trial Club, as follows: Whereas, A newspaper published in the city of New York has created mad dogs in this State, and as this club knows the full pedigree of such dogs to be sired by paper and dammed by ink, therefore be it resolved, That the New Jersey Kennel and Field Trial Club offer a reward of $100 for the production of a living dog with rabies, said dog to be examined by a committee of three veterinary surgeons, and then place such dog on exhibition in the Newark show to be held in March next.

THE NEW YORK FANCIERS' SHOW.—The fourth annual exhibition of the New York Fanciers' Club, to be held next month at Madison Square Garden, will probably contain quite a display of dogs. The toy dogs and ladies' pets will be benched in a warm room. The judges are: For pointers, setters, deerhounds, greyhounds, basset hounds, dachshunde, mastiffs, bull-terriers, Ulmers, Yorkshire and toy terriers and Italian greyhounds, Mr. Chas. H. Mason, Bay Ridge, L. I. All other classes (except litters of puppies and miscellaneous, which will be judged by both; Mr. James Watson, Philadelphia, Pa.

THE NEW HAVEN DOG SHOW.—The judges for the New Haven dog show, to be held in March, so far as they have been selected, are Mr. John Davidson, of Monroe, Mich., and Mr. Chas. H. Mason, of Bay Ridge, L. I. We hope to be able to give next week a full list with the classes assigned.

THE RANCOCAS KENNELS.—Mr. Percy C. Ohl has resigned the position of manager of the Rancocas Kennels and is succeeded by his brother. The kennels will soon be removed to Tuxedo Park, in Orange county, N. Y.

KENNEL NOTES.

KENNEL NOTE BLANKS.—For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." All Kennel Notes must be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Captain Snuff. By Wm. R. Sanders, Cohocton, N. Y., for liver and white English water spaniel dog, whelped Feb. 1, 1885, by Sam (Romey—Jessie) out of E. A. Higgins's Fannie.

Prince Gladstone. By Chas. York Bangor, Me., for black, white and tan Llewellin setter dog, whelped Aug. 13, 1885, by Gem (A.K.R. 1538) out of Pearl Blue (A.K.R. 1542).

Dunstan. By Shaw & Bates, Clinton, Mass., for fawn mastiff dog, whelped Nov. 17, 1885, by Agrippa (A.K.R. 449) out of Delph Viva (A.K.R. 1432).

Dis. By Shaw & Bates, Clinton, Mass., for fawn mastiff bitch, whelped Nov. 17, 1885, by Agrippa (A.K.R. 449) out of Delph Viva (A.K.R. 1432).

Les. By E. W. Jester, St. George's, Del., for solid fawn Italian greyhound dog, whelped Nov. 24, 1885, by Silk Socks (Sport—Pearl) out of Tiney (Romeo—Babie).

Royal Maid. By J. W. Newman, Boston, Mass., for white bull-terrier bitch, whelped April 12, 1885, by Mark-Eared Royal (A.K.R. 3100) out of Bartlett's Fanny.

Bob White. By G. H. Nixon, Leesburg, Va., for liver and white ticked pointer dog, whelped July 17, 1885, by Joker, Jr. (Beaufort—Nymph) out of Gussie (Beaufort—Maggie).

Chippewa Chief. By Dr. W. Thornton Parker, Newport, R. I., for red Irish setter dog, whelped Dec. 5, 1884, by Watch (Berkeley—Rose) out of Brownie.

Trim. By Julius E. Wilson, Manchester, N. H., for mouse and white Italian greyhound dog, whelped July 1, 1885, by Don (Prince—Mollie) out of Nellie.

Spark Noble. By J. A. Hoffar, Washington, D. C., for lemon and white English setter bitch, whelped Feb. 18, 1885, by Count Noble (Count Wind'em—Nora out of Sanborn's Spark (Carlowitz—Magnet).

Queen Mab. By E. A. Higgins, Cohocton, N. Y., for black and white cocker spaniel bitch, whelped April 11, 1885, by Hornell Jack (A.K.R. 1277) out of Hornell Anna.

Barkis. By E. A. Higgins, Cohocton, N. Y., for white and liver English water spaniel dog, whelped Sept. 1, 1885, by Romey (Romeo—Juliette) out of Wolf's Jessie.

Sam, Jr. By John Snyder, Cohocton, N. Y., for liver and white English water spaniel dog, whelped Sept. 1, 1885, by Romey (Romeo—Juliette) out of Wolf's Jessie.

Lady Clair. By E. A. Higgins, Cohocton, N. Y., for orange tawny and white St. Bernard bitch, whelped Aug. 22, 1885, by Bonivard II. (A.K.R. 474) out of Cassandra (A.K.R. 1158).

Major Fred. By S. H. Pitcher, Cohocton, N. Y., for liver and white English water spaniel dog, whelped Sept. 1, 1885, by Romey (Romeo—Juliette), out of Wolf's Jessie.

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Pride—Dictator. Shaw & Bates's (Clinton, Mass.) mastiff bitch Pride (A.K.R. 1516) to their Dictator (A.K.R. 1503), Jan. 4.

Gussie—Joker, Jr. G. H. Nixon's (Leesburg, Va.) pointer bitch Gussie (Beaufort—Maggie) to his Joker, Jr. (Beaufort—Nymph), Dec. 6, 1885.

Italie—Snap. E. W. Jester's (St. George's, Del.) Italian greyhound bitch Italie (Swift—Fawn) to Dr. E. N. Mosser's Snap (Rome II.—Naughty), Jan. 5.

Pearl—Snap. E. W. Jester's (St. George's, Del.) Italian greyhound bitch Pearl (Douglass—Gipsey Queen) to Dr. E. N. Mosser's Snap (Rome II.—Naughty), Jan. 6.

Victory—Pride of Dixie. Detroit Kennel Club's (Detroit, Mich.) English setter bitch Victory (Count Rapier—Reign) to Wm. Fisher's Pride of Dixie (Gladstone—Countess Druid), Dec. 28, 1885.

Nellie—Bannerman. S. Jacobs's (Wrightsville, Pa.) beagle bitch Nellie to A. C. Krueger's Bannerman (Marchboy—Dewdrop), Dec. 30, 1885.

Queen—Bannerman. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Queen (Victor—Lucy) to his Bannerman (Marchboy—Dewdrop), Nov. 19, 1885.

Fairy—Bannerman. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Fairy (King—Music) to his Bannerman (Marchboy—Dewdrop), Jan. 5

Nettle—Regent Vox. W. H. Cookson's (Hudson, N. Y.) fox-terrier bitch Nettle (Gamester—Vixen) to August Belmont, Jr.'s, Royal Vox (Tackler—Sandy Vic), Dec. 21, 1885.

WHELPS.

☞ **Notes must be sent on the Prepared Blanks.**

Syren. Herbert Flint's (Haverhill, Mass.) Irish setter bitch Syren (Elcho—Rose), Jan. 7, eight (four dogs), by W. K. Pierce's Glencho (Elcho—Noreen); one dog since dead.

Little Eva. H. A. Saunders's (South Norwalk, Conn.) English setter bitch Little Eva (Mac—Louise), Jan. 7, ten (five dogs), by R. G. Hamilton's Prime (Blue Dick—Pilgrim); two dogs and three bitches since dead.

Kate. Geo. E. Poyneer's (Williamsburg, Ia.) Chesapeake Bay bitch Kate, Jan. 1, seven, by his Gowrie.

Fairy. Kentucky Pug Kennels' (Newport, Ky.) pug bitch Fairy (A.K.R. 2248), Jan. 4, four (two dogs), by their champion Treasure (Fritz—Banjo); two dogs since dead.

Rose Pape. Louis Melchor's (Battle Creek, Mich.) black pointer bitch Rose Pape (Joe Pape—Nellie Pape), Dec. 12, 1885, six (one dog), by Detroit Kennel Club's champion King Bow (Bow—Taffee).

Victress. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Victress (Victor—Lucy), Dec. 29, 1885, eight (four dogs), by his champion Bannerman (Marchboy—Dewdrop).

Lill. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Lill (Warrior—Rowett's Rosey), Oct. 24, 1885, three (two dogs), by his Bannerman (Marchboy—Dewdrop).

Kitty. A. F. Hausmann's (Binghamton, N. Y.) cocker spaniel bitch Kitty (Hornell Dandy—Luna), Dec. 17, 1885, six (one dog), by E. Powers's Kiddlewink (Gloss—Nipper).

Fannie. E. A. Higgins's (Cohocton, N. Y.) imported English water spaniel bitch Fannie, Jan. 4, six (two dogs), by A. C. Eustace's Mack (Hornell Bub, A.K.R. 138—Bessie).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Nelly. White, black and tan beagle bitch, 2yrs. old, by A. C. Krueger, Wrightsville, Pa., to S. Jacobs, same place.

Flash. Fawn greyhound bitch, whelped Aug. 13, 1885, by Sport out of a Custer bitch, by E. W. Jester, St. George's, Del., to James E. Hair, Bridgeport, Conn.

Streak White, with blue head, greyhound dog, whelped Aug. 13, 1885, by Sport out of a Custer bitch, by E. W. Jester, St. George's, Del., to Jas. E. Hair, Bridgeport, Conn.

Joker, Jr.—Lady Mac whelps. Liver and white pointer dogs, whelped March 30, 1885, by G. H. Nixon, Leesbur, Va., a dog each to Charles R. Squire, Troy, N. Y., and Dr. A. F. Dulin, Baltimore, Md.

Gun (A.K.R 1538)—Pearl Blue (A.K.R. 1542) whelps. Llewellin setter, whelped Aug. 14, 1885, by Chas. York, Bangor, Me., a blue belton bitch to Dr. C. E. Stanley, Middletown, Conn., and a black, white and tan dog to Chas. F. Emery, Rockville, Conn.

Rebel—Georgia whelp. White, black and tan foxhound bitch, whelped Sept. 18, 1885, by N. Elmore, Granby, Conn., to Hon. A. R. Starr, Marshall, Texas.

Ringwood—Gay whelp. White, black and tan beagle, whelped Sept. 30, 1885, by N. Elmore, Granby, Conn., to James McKnight, Poquonock, Conn.

Ringwood—Collette whelp. White, black and tan beagle bitch, whelped April 28, 1885, by N. Elmore, Granby, Conn., to L. W. Laing, White Cloud, Mich.

Rebel—Georgia whelps. Three white, black and tan foxhound dogs, whelped Sept. 18, 1885, by N. Elmore, Granby, Conn., to Hon. H. A. Starr, Marshall, Tex.

Regent. White, with brindle mark on ear, bull-terrier dog, whelped Nov. 8, 1885, by The Earl out of White Rose (A.K.R. 2906), by Frank F. Dole, New Haven, Conn., to W. W. Dudley, same place.

Young Dutch. White bull terrier dog, whelped April 28, 1885, by Dutch out of White Rose (A.K.R. 2903), by Frank F. Dole, New Haven, Conn., to Blair Painter, Pittsburgh, Pa.

Ned Red Irish setter dog, whelped Aug. 2, 1885, by Glencho out of Vic, by Associated Fanciers, Philadelphia, Pa., to E. M. Patterson, Oswichee, Ala.

Hermit. Lemon and white pointer dog, whelped May 31, 1885, by Rush III. out of Flirt, by Associated Fanciers, Philadelphia, Pa., to Gibbons & Co., West Chester, Pa.

Cat. Lemon and white English setter dog, whelped July 10, 1885, by Sam out of Gloom, by Associated Fanciers, Philadelphia, Pa., to E. M. Patterson, Oswichee, Ala.

Jag. Beagle dog, whelped Dec. 10, 1884, by Oscar out of Zaney, by Associated Fanciers, Philadelphia, Pa., to J. K. Woodward, New Albany, Ind.

Countess. Lemon and white English setter bitch, whelped June 16, 1883, by Neptune out of Ruby, by Dr. R. H. Evans, Washington, D. C., to T. J. Flack, same place.

Jurry. Lemon and white pointer dog, whelped Aug. 16, 1883, by Vic out of Flirt Pitzer, by H. A. Saunders, South Norwalk, Conn., to A. Duyree, Brooklyn, N. Y.

Chippewa Chief. Red Irish setter dog, whelped Dec. 5, 1884, by Watch out of Rose, by Frank Downs, Newport, R. I., to Dr. W. Thornton Parker, same place.

PRESENTATIONS.

Lady Clair. Orange tawny and white St. Bernard bitch, whelped Aug 22, 1885, by Bonivard II. (A.K.R. 474) out of Cassandra (A.K.R. 1158), by Rev. Chas. F. Kelly, Towanda, Pa., to E. A. Higgins, Cohocton, N. Y.

Ina. Red Irish setter bitch, whelped Sept. 10, 1585, by Glencho out of Flame, by John G. Tod, Harrisburg, Tex., to Chas. H. Milby, same place.

Clint. Red Irish setter dog, whelped Sept. 10, 1885, by Glencho out of Flame, by John G. Tod, Harrisburg, Tex., to Chas. H. Milby, same place.

Flora. Red Irish setter bitch, whelped Sept. 10, 1885, by Glencho out of Flame, by John G. Tod, Harrisburg, Tex., to R. J. Pollard, Houston, Tex.

IMPORTATIONS.

Ruth. Rough coated St. Bernard bitch, 18mos. old, by Barry out of Belle, by Wm. J. Ehrich, New York, from Switzerland.

DEATHS.

Lill. White, black and tan beagle bitch, 10yrs. old (Warrior—Rowett's Rosey), owned by A. C. Krueger, Wrightsville, Pa.

Discord. White, black and tan beagle bitch (A.K.R. 2915), owned by Wm. H. Pease, Fort Edward, N. Y., Jan. 8, from distemper.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

J. M., Watkins, N. Y.—My pointer dog has been unwell for some time past. His hair looks dead and stands on end; he has a dry cough and his nose is hot and dry, has but little appetite; acts well in field, but is very inactive around the house. Ans. Begin by giving ten grains of quinine in a pill concealed in a bit of meat. If fever be present give five drops of tincture of aconite every two hours until fever subsides. If cough is severe give pills of tartar emetic, each to contain one-twenty-fourth of a grain. As a steady tonic we know of nothing better than Fowler's solution of arsenic in five-drop doses twice daily in the food.

D. H., Jr., Baltimore.—I have a fox terrier whose hair is all the time coming out—so much so that anything he comes in contact with gets full. Ans. Give your dog five drops of Fowler's solution of arsenic morning and evening with his food; it is tasteless. After giving the medicine for three weeks stop for ten days and then commence again.

The FOREST AND STREAM, a weekly magazine devoted to the interest of sportsmen, has been a welcome visitor to our sanctum for the past month or two. It is just the thing for lovers of rod and gun. It is always filled with choice matter on hunting, fishing, boating, kennel management, fish culture and every subject interesting to those who love the sports of the field or flood. Its discussions on guns and shooting contain much valuable information, while its stories of hunting adventure, related mostly by the participants themselves, have strong interest for any one who has ever handled a gun in the pursuit of game. One of its special objects is the preservation of game, and this feature alone is enough to win it favor from every true sportsmen.—*Tuscarawas Chronicle.*

MEN HAVE NO RIGHT to expose their families to the risk of being thrown helpless on the world, when they can prevent it at small cost by taking a policy in the Travelers, of Hartford, Conn.—*Adv.*

Rifle and Trap Shooting.

NATIONAL RIFLE ASSOCIATION.

THE fourteenth annual meeting of the National Rifle Association took place on the evening of the 12th, in the officers' room of the Twenty-second Regiment Armory. There was barely a score of members present, and beyond the routine reports the proceedings were dull and monotonous, except when one of the delegation of "kickers" growled about the "star chamber proceedings." etc. Gen. G. W. Wingate was in the chair, and on calling the meeting to order spoke briefly of the work for the past year.

Gen. Wingate said: "This is the fourteenth occasion upon which the life members of the National Rifle Association have assembled to elect its directors and listen to the reports of the officers. In those fourteen years we have seen the interest in rifle shooting extend from the few who first met to elect themselves as its directors into a universally recognized part of the military instruction of the army, and of the National Guard of nearly all the States. The absorbing interest with which the matter was taken up by the civilian element of the public has not lasted, and in a community like ours could not be expected to last after the novelty had worn off. But among the soldiers it has become too firmly established to be ever disturbed. Now that the excitement of the first years of our existence has subsided, there is but little to report to you at our annual meetings, as the events of one year are much like those of another. Our endeavor during the past year has been to reduce expenses, to omit all competitions which were unprofitable, and to bring the management of the Association down to business principles. In this we have succeeded, largely through the efficient management of the Secretary, Mr. Shepherd. During the past year we introduced the experiment of largely increasing the prize lists in our annual meetings in the hope that it would result in attracting sufficient additional competitors to avoid loss. I regret to say that the result was not obtained. No substantial increase in our entries was obtained and the experiment resulted in a loss of $500, almost all of which was in a single match. The attempts that the Association has been making for the last few years to popularize long range firing with military rifles, do not seem to meet with success. The great majority of riflemen desire to fire at only 200, 500 and perhaps 600 yards, and the number of those who can be induced to practice at the longer ranges is very few, and do not seem to be upon the increase. No competitions having occurred during the past year which interested the general public, the affairs of the Association have not been given much attention by the press. Still, the shooting has been of a high order of merit, the practice at Creedmoor has been up to the average of the last four years and the affairs of the Association are in a healthy condition.

Secretary Shepherd was called on for his report of the doings in detail during 1885. He made his report brief and to the point, saying:

NEW YORK, Jan. 12, 1886.

Mr. President, Directors and Life Members of the National Rifle Association:

Your Secretary respectfully submits the following report of the transactions of this Association for the year 1885: The reorganization of the Board of Directors for the year was made on Jan. 13 by the re-election of the President, Vice-President and Treasurer and the election as directors for three years of Messrs. Allen, Bridge, Duane, Shorkley and the undersigned, who was afterward elected Secretary.

The vacancy caused by the resignation of Major Fincke in April was filled by the election of Mr. Kendall.

The Board of Directors has met twelve times during the year for the transaction of business, and I regret to add that on six other occasions meetings were called but were adjourned for the want of a quorum.

The office at No. 102 William street was found to be inconveniently situated and undesirable in other respects, and for a slight increase in rental the present office in Temple Court was secured.

On the 6th of February a communication was forwarded to the secretary of the National Rifle Association of Great Britain, inviting a team of British volunteers to visit this country to shoot a match at Creedmoor in September against a team to be selected from members of the National Guard of this country, but the invitation was declined on the ground of the unsettled state of affairs both at home and abroad. I would ask the Association if it would not be well to again invite a team to visit us during the coming season for an International Military match, such team to consist of eight men and two reserves.

In April the lease of the club house to Mrs. Klein was renewed for one year at a rental of $600.

The annual fall meeting was not a success financially, notwithstanding the fact that every effort was made to attract riflemen to Creedmoor by giving an early distribution to the programmes and offering a very attractive prize list, amounting in cash prizes alone to the sum of $2,345. The loss amounted to $600, more than one-half of which was in the President's match. The plan of extending the meeting did not work well, especially for competitors who came from a distance, and who as a rule prefer to end their shooting with the close of the first week. From the experience of last year we should be able to arrange an attractive programme for 1886, by offering liberal cash prizes.

The monthly matches, on the other hand, have been successful beyond our expectations, the entries being greatly in excess of the previous year and amounting to some $2,094, while the expenses were $380, and we paid in cash prizes the sum of $356, leaving a profit to the Association of over $1,350.

The Association is indebted to Col. Church, of the *Army and Navy Journal*, for the valuable prize given by him; to Messrs. Tiffany & Co., for a silver vase, and to Messrs. Benedict Bros., for a handsome clock and side pieces. We also received from Maj. George Shorkley his annual gift of $100, and the thanks of the Association are due to Messrs. Bridge and Kendall for their successful efforts in collecting the full prize list in the Chambers Street match. The Long Island Road Company has accommodated us by an extra train from Jamaica to Queens during a part of the season, when required; but I think it should show a more liberal spirit by granting us a lower rate for excursion tickets to Queens for members of the Association and National Guard. We have sold this year over 1,500 tickets in the office at 50 cents each.

The annual reports since 1881 remain unpublished, owing to the heavy cost of same. The resignation of the assistant secretary, Mr. Vose, was handed in in January, and his place since May 15 has been very ably filled by the present incumbent, Mr. Manz.

The only clubs affiliating during the past year were the 69th Regiment Rifle Club and the Amateur Rifle Club, and at the September meeting a resolution was passed opening the range to all comers free of charge. As this may appear to be contrary to the by-laws, I would suggest that some action be taken this evening on the matter as to the plan to be pursued the coming season, and would recommend that the experiment be tried for another year.

The Hinman ring target, as approved by the Association, has been adopted as the standard by the majority of the Eastern rifle clubs, and will no doubt be used by them during the coming season.

The lease of the West range expired on the 1st inst., and can only be renewed at a greatly increased rental; the range committee have the matter in hand, and will make an early report. The Treasurer's report to Jan. 1, 1886, shows the net receipts have amounted to $6,475.65, exclusive of the fall meeting, and a balance on hand of $556.60, and due in addition from the State of Pennsylvania, $160.

Respectfully submitted,

JOHN S. SHEPHERD, Secretary.

There was some complaint about life members failing to get notices of what the Association was doing. Secretary Shepherd gave notice that full shooting programmes from month to month would be sent to any person, member or not, who wished to go to Creedmoor and who would leave name and address at the Temple Court office. The choice of directors for three years resulted in the re-election of the following gentlemen: Gen. George W. Wingate, Col. John Ward, Col. R. C. Ward, Col. Joseph G. Story, Lieut. E. L. Zalinski.

RANGE AND GALLERY.

WORCESTER, Mass., Jan. 7.—There was a meet yesterday at the Pine Grove Range of members of the Worcester Rifle Association. The wind was strong and very unsteady. The standard decimal target was used, with the following results:

Rice	5	9	8	6	6	7	6	8	9	8—72
Clark	8	7	7	6	5	5	8	3	8	6—63
Jones	6	8	8	6	7	4	5	6	6	6—62

Practice scores were then made by some of those present, as follows:

Clark	5	9	9	7	6	8	8	8	7	8—75
Burton	6	8	10	8	6	9	4	8	10	6—75
Jones	4	9	10	9	4	8	6	8	7	6—71
Bates	8	8	9	6	9	9	4	6	8	8—70
Rice	4	6	9	7	6	6	7	6	8	10—68
Albert	8	6	8	7	9	7	4	9	6	8—67

GARDNER, Mass., Jan. 6.—At the last meet at the Hackmatack Range the members of the Gardner Rifle Club had present as guests A. C. White, of Worcester, Mass., and H. C. French, of Brattleboro, Vt. During the meet there was a team shoot, five men on a side; each had twenty shots. The results were: G. F. Ellsworth's side, 762; I. N. Dodge's side, 707. The new standard American target was used; two strings were shot, with a possible 100 in each, with the following results:

G F Ellsworth	87 88—175	H C French	80 71—151
I N Dodge	83 88—171	Frank Nichols	73 78—151
George Fay	84 85—169	George Warfield	68 69—137
G C Goodale	79 81—160	Charles Crabtree	68 65—138
A C White	79 79—158	C N Edgell	62 54—116
W C Loveland	72 83—155	Charles Powell	60 53—113

SHOOTING SNOWBALLS.—Rome, N. Y., Jan 9.—Jan 1 and 2 Will A. Parker, of Rome, made quite a good score at wing rifle shooting. He uses a Winchester .32-20 repeating rifle, and—on this occasion—shot at 6 yards rise. He fired 125 shots at snowballs 2½ inches in diameter, the exact size of a glass ball, and 120 disappeared at the pull of the trigger. Before this his best score was 24 out of 25, 6 yards rise. Balls were broken in the air at a distance of about 30 or 35 feet from the shooter, with a run of 100 without a miss. After this was done he shot at 6 leaden discs the exact size of a silver dollar and hit three of them. Later he, with different sights, shot at pieces of brick at 10 and 14 yards, and hit almost every shot. Once he hit a snowball in the air thrown at 15 yards that was thrown nearly from him. When hit it must have been nearly 35 yards from him. It was the nicest shot I ever saw. He has never made any scores with a shotgun; in fact, he says: "I never shot a shotgun at a ball or pigeon or any other flying target. With a shotgun it is not so fine work, although extremely difficult to make some shots. I can hit two bricks halves and have the shots as near together as any shotgun man can make a double from a revolving trap." He has broken three blocks tossed in the air with his rifle in 5 seconds, and five in less than 8 seconds. Hereafter, he says, he will pay his attention to shooting balls at the longer distances rather than fast shooting—I mean 10 to 18 yards.—VIDI.

NEWARK, N. J., Jan. 8.—In regard to the oldest organization in this city the statement in your last issue by me was an error. I have since learned that the Essex Rifle Club was organized Jan. 20, 1879, this would make them the oldest association, instead of the Frelinghuysens who rank second, and the Warrens third. The officers of Essex as elected at last meeting are: President, Roger Marshall; Vice-President, C. H. Miesel; Secretary and Treasurer, J. H. Huegel; Financial Secretary, John W. Hoch; Sergeant-at-Arms, John Dion; Captain of teams, John Coppersmith; Rifle Inspector, Godfrey Snellen; Scorer, Albert Lake; Shooting Committee, C. H. Miesel, William Watts, Charles Cooper. Regular weekly meetings are held Monday evening at 326 Bank street. Annual meeting and election third Monday in January.—A. C. W.

SPRINGFIELD, Mass., Jan. 5.—The weekly shoot for the monthly badges of the Rod and Gun Club this afternoon was fairly attended and some fine scores were made. The new standard target designed by C. W. Hinman was used for the first time and gave much satisfaction. The scores are out of a possible 100, and are as follows:

G Browning	10	7	7	10	9	7	6	9	10	7—82
E T Stephens	10	10	10	7	7	9	10	7	6	6—82
J Allen	7	9	6	6	9	5	5	6	10	10—73
S K Hindley	10	9	9	6	4	8	6	6	6	5—69
L H Mayott	6	6	5	6	6	7	8	9	6	9—68
J Towne	8	2	5	8	8	3	4	8	9	4—54
H McDonald*	8	4	4	6	5	6	5	4	9	8—51
J Stirling*	5	5	6	4	3	4	3	6	5	9—50

*Used State military rifles.

WALNUT HILL RANGE.—Jan. 9.—The severe storm kept the riflemen at home to-day. But few scores were finished:

J Francis, D	8	7	4	10	8	7	7	8	10	9—78
C B Edwards, C	9	9	8	10	6	5	8	7	9	6—77
J Missam	10	5	7	8	10	7	6	7	9	7—76
A Duffer, D	7	8	7	9	7	6	8	7	7	8—74
J B Fellows, M	8	8	5	9	9	9	3	8	8	5—72

ZETTLER RIFLE CLUB.—Jan. 5.—Regular Club shoot, ring target, possible 120, gallery 100ft. long: M. Dorrier 118. D. Miller 116. M. B. Engel 114, A. Lober 113, B. Wahiter 92, G. Zimmermann 113. C. G. Zettler 113, B. Zettler 115, T. C. Noone 104, L. Flach 105, C. W. Karcher 110, M. L. Riggs 112, J. W. Plaisted 105.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

WELLINGTON, Jan. 6.—A large assembly of shooters came together yesterday for the purpose of carrying out the programme put forth by the Boston Gun Club. Clay pigeons, Knoxville blackbirds and Macomber metal birds received an ample share of patronage. A northwest wind prevailed above the right hand quarters, with a speed requiring the greatest skill, but shooters could not have been selected who would have handled the birds better. Worcester, Exeter, Brockton, Falmouth, Portsmouth, Clinton, Chelsea, sent their best shooters to contest for the different badges and sweepstakes. Appended is the result of the competition: 1. Seven single Knoxville targets, 18 yds. rise—W. Allen, H. W. Webber, E. Shumway and C. M. Stark. 2. Three pair Knoxville targets—Allen, first. 3. Seven single Macomber metal birds—Bartlett first. 4. Three pair blackbirds, 15yds rise—R. F. Schaefer, Stark and Dickey first. 5. Seven single blackbirds—J. Nichols first. 6. Individual champion match of the Massachusetts State Glass Ball Association, Knoxville blackbirds being substituted for glass balls. Stark of the Boston Gun Club was the holder, being challenged by Perry of the Worcester, Dickey of the Massachusetts Rifle Association, Aldees of the Brockton club, R. Schaefer of the Wellington Gun Club. Stark held the badge, Perry second, Schaefer third and Aldees forth. An independent sweep was held with this match, which was at 50 birds, Eager taking first, Wardwell and Perry taking second. 7. Seven Macomber targets—Bartlett first. 8. Three pair clay pigeons—E. W. Law and Wardwell first. 9. Five clay pigeons—Curtis and Schaefer first. 10. Five straightaways—Wardwell, Schaefer and Swift first. 11. Seven single clay pigeons—T. S. Stanton and W. Simpson first. 12. Five straightaways, blackbirds—Stark first. 13. Seven blackbirds—Law and Swift first. 14. Seven clay pigeons—Houghton first. 15. Seven clay pigeons—Houghton and Stark first. 16. Seven clay pigeons—Swift first. 17. Seven clay pigeons; entries for Boston Gun Club prizes—Wardwell first. 18. Miss and out—Swift first, and also took the pot. 19. Miss and out—Stark scooped the purse. Darkness alone took the shooters into camp and finished one of the red letter days at the Boston shooters.

Jan. 9.—Nothwithstanding the wind whistled across the Wellington Range to-day, and the snow driven by the wind nearly hid the clay-birds, about thirty lovers of the shotgun stood at the traps, and for about five hours blazed away at the birds as they rose in the air. The result of the sport: 1. Five pigeons—Sanborn and Wilson first. 2. Five blackbirds—Sanborn and Schaefer first. 3. Five blackbirds—Wardwell first. 4. Five blackbirds—Snow first. 5. Five pigeons—Schaefer first. 6. Five blackbirds—Warren and Swift first. 7. Five pigeons—Schaefer first. 8. Five blackbirds—Wardwell first. 9. Five pigeons—Frank Schaefer and Perry first. 10. Five blackbirds—Loring and Warren first. 11. Five blackbirds—Perry, Loring and Warren first. 12. Five pigeons—Snow and Loring first. 13. Five pigeons, straightaway—Snow and Loring first. 14. Five blackbirds—Stanton and Perry first. 15. Five pigeons, straightaway—Snow first. 16. Five pigeons—Wardwell first.

"GRAHAM" IN AMERICA.—Wm. Giles, shooting under the name of Graham and known on all the English grounds, is now in this country and is, he says, very anxious to arrange a match with Captain Carver. He issues a challenge open to anybody to shoot under these conditions: One hundred birds, 21 yards rise, 5 traps, 1¼ ounces of shot, no restrictions as to weight of gun or size of bore. Or Graham will stand at 26 yards and use one hand only while his opponent stands at 32 yards and uses both hands. Either match to be for $500 or $2,000 a side. Graham uses a very light hammerless gun. Several years ago Captain Carver visited England and succeeded in beating the English champion, William Graham, by but two glass balls in one thousand. In the next match Carver was defeated. The coming of Giles has roused Capt. A. H. Bogardus who says that when he went to England in 1875 and 1878 he shot all comers under English rules. He now challenges Mr. Giles to shoot him three matches of one hundred birds each, as follows:—Mr. Giles to name the rules to govern one match, Captain Bogardus to name the rules to govern one match, while in the third match half the birds shall be governed by the rules of each contestant. Captain Bogardus says he will shoot in any city and for any amount for the championship of the world. Dr. Carver, the wing shot, passed through Kansas City a few days ago, on his way to Chicago. He said he intended to duplicate his New Haven record by breaking 60,000 glass balls in six days. He had selected Kansas City as the place for the shooting, and would have men, instead of traps, to throw the balls. Regarding competition with other sportsmen, he said he had been challenged by a number of men who claim to be wing and rifle shots, but, as their challenges have never been accompanied by money, he has ignored them. "I am willing and ready," said the doctor, "to defend my title as champion wing and rifle shot of the world against all comers."

KINGSTON VS. TRENTON.—Kingston, N. J. Jan. 7.—Return match between the Kingston Gun Club and Trenton Gun Club. The day was very cold and windy, the cold pierced through a man before he could shoot five clay pigeons; it was a bad day for shooting, a day to test any man's skill with a gun at the trap. Ligowsky clay pigeons, 5 traps, fourth notch, 18yds:

Kingston Gun Club.

BOSTON, Jan. 7.—The Suffolk Sportsmen's Club of Chelsea, its members comprising many of the business and professional men of Chelsea, was organized in 1880. Its range is located at the easterly side of Powder Horn hill. The club has leased and elegantly fitted up city rooms, where they have a large cabinet of stuffed rare birds, a collection of over 100. In the main hall is a large eagle which was shot by one of the members in North Carolina. The annual meeting of the club was held this evening. It was largely attended. The following officers were elected for 1886: President, J. E. Simpson; vice-presidents, Benjamin T. Martin and Kimball Easterbrook; secretary, Capt. William R. Swan; treasurer, Noah Blanchard; executive committee, H. N. Blanchard, F. M. Whiting, P. F. McDonald and W. E. Perry. Shortly before 10 o'clock the members and invited guests (the Wellington Gun Club being represented), sat down to a banquet at the City Hotel, the tables being loaded with good things, including rare birds.

BROOKLYN, L. I.—At the annual meeting of the Unknown Gun Club, Jan. 7, 1886, the following officers were elected for the ensuing year: Henry Knebel, President; John Akhurst, Vice-President; Henry van Staden, Treasurer; Ellis Layton, Secretary. The club having extended the limitation clause in regard to membership from 50 to 75 took in 5 new members. The new prize shooting arrangement for the year is to be a shoot on the second Thursday of each month, 4 cash prizes for each shoot, to be taken out of the club funds and to be competed for on the classified plan, in addition to 4 extra prizes of $10 in cash, a donation by friends of the club to be competed for during the 12 monthly shoots, the 4 members making the best individual scores in 6 out of 12 shoots to take the prizes, but a member must compete no less than six times to have a claim.—H. K.

THE LEAVENWORTH (KAN.) GUN CLUB held its regular annual meeting Jan. 4, and the following officers were elected: President, Col. Thomas Moonlight; Vice-President, A. C. Girard; Secretary, W. C. Hinman; Treasurer, George Goff; Board of Managers, Henry Lanitz, George Biringer and West Gordon. The club is in good standing and has a surplus of funds on hand for a three-days' tournament in the early spring at live birds, and several flying-traps now in use.—W. C. H.

CAPTIVE PIGEONS.—A correspondent of the Toronto *Mail* has discovered a club of marksmen who shoot at pigeons from a trap, but each bird when flown has a string tied to its leg. If killed, all right; but if missed, the string insures the return of the bird for further practice. We can hardly believe that such an unsportsmanlike practice exists.

EMERALD GUN CLUB.—The fourth annual invitation ball of the Emerald Gun Club on Monday evening, Jan. 25, 1886, at Walhalla Hall, 48-52 Orchard street. Invitations will be gladly extended to members of other clubs, and may be had upon application to George V. Hudson, M.D. Pres., 55 Henry street, New York.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

CRUISE OF THE COOT.

VIII.

SUNDAY before Thanksgiving had been set for the day of departure. Oil can and breaker had been replenished, as also the stock of fresh meat and potatoes. Saturday had come, but wind came not with it. There had been an ominous calm for three days, with a moisture in the atmosphere denoting an approaching blow from off the Atlantic. When I pulled alongside Saturday evening the river was glassy smooth, and nature reposed in tranquil mood, though there was something sullen in the aspect not reassuring. As the Orange Blossom, the cognomen bestowed upon the skiff, shot up under the quarter and I stepped aboard the yacht, an ominous whistle suddenly swept through the gear and as quickly subsided. Not a ripple did it create upon the water, but it came along sharp and decisive, which boded more to follow. A second and a third puff, chilly and damp, initiated the ball, and in ten minutes more the river had been serrated into lines of rushing ripplets, driven before the first impulse of an oncoming gale. In an hour it was down upon us with great strength, and it continued to wax more furious throughout the night. At first the full import of the warning signs had hardly been read, though precautions had been taken, the second anchor being hove over the bow to a short scope. I turned in and slept soundly, as I always do aboard ship. Once in the night, canting over for a fresh launch into the land of dreams, I heard a rattling of gear and whistling of wind, and felt the little Coot rise and fall and pull at her line. But with both anchors out this gave me no concern, and, besides, I had other business on hand just then.

When morning brought sleep to an end an uncomfortable state of affairs met my gaze out of the cabin doors. Heavy clouds of boisterous mien had enveloped the heavens. The shores were draped in gray drizzling mist, and rain began sprinkling. The wind had increased to a furious gale from the northeast. High seas were running, the Coot plunging restlessly about and rolling scuppers under with a lee shore close aboard—not a smooth beach upon which she might have grounded her heel and helped out the anchor, but a menacing line of pile work encircling the Staten Island shore in an endless trestle for the new Rapid Transit railroad. The knotty unhewn trees raised their rough heads six feet above water and were capped by heavy ballis, braced and counterbraced, with bolt heads sticking out here and there, grim and inhospitable, holding out nothing but immediate destruction to anything dashed within reach. To more thoroughly embay the Coot there was a pier jutting out several hundred feet, and a number of small boats at anchor in the angle. Down upon these the Coot was likely to drive and carry havoc among others besides breaking her own bones, should she drag her anchors in the soft bottom. For a time everything went well and confidence was not shaken. By midday it was howling a hurricane as ugly as ever I had seen, and beyond what the imagination can depict. Worst of all, the bottom was proving treacherous.

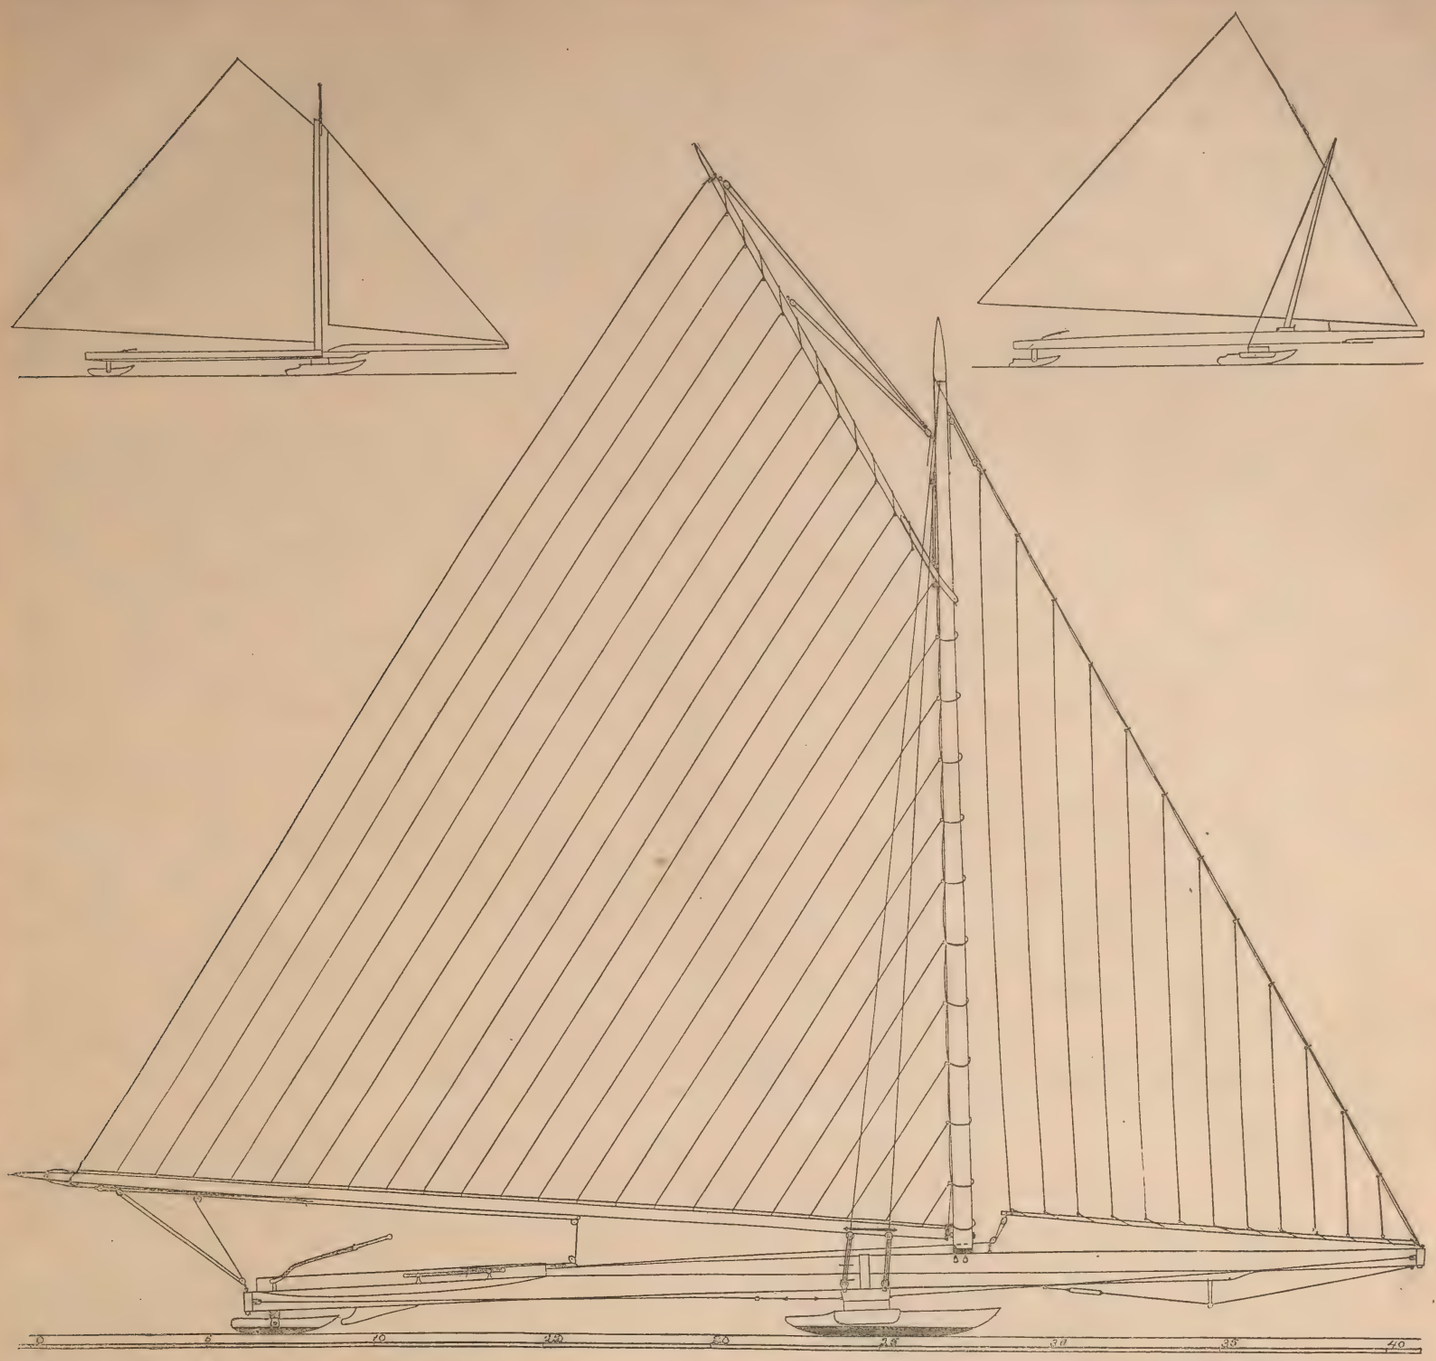
The Kill von Kull once a fine reach of clear, flowing tides, giving life to countless fish and oysters and boasting many a fine yacht anchorage, has been polluted to a filthy sewer by the oil refining monopolies established on the Jersey shore. Tons upon tons of sludge acid are clandestinely poured into the river every day with an utter contempt for law and common decency, until the once limpid waters of the Kill flow like sluggish slime, contaminating everything that floats upon its bosom and killing the natural wealth of food supply, robbing many a poor fellow of his former means of livelihood. Once in a great while a few Staten-Islanders rouse from their Rip Van Winkle sleep to draw up a set of mild resolutions which are safely pigeonholed in the deepest recesses of the legislative halls in Albany. A shore inspector flourishes and grows fat upon a big salary and accomplishes absolutely nothing, if he makes any earnest attempt at all to abate the crying nuisance. The wealthier and more influential the corporation, the more reckless disregard does it exhibit, caring not a fig for the rights of the public, so a petty sum can be saved by snapping its fingers at the law and the people's faithless servants. Matters have gone from bad to worse, till it is impossible to boat, swim or fish in a great watery highway upon which the relentless tentacles of grasping, conscienceless corporations have fastened; to the destruction of its legitimate purposes. As every means has been exhausted to rescue the Staten Island river from the baleful clutch of the oil refining monopolists, the people, as usual, passively submit to an infamous nuisance which would not be tolerated for twenty-four hours in any other country but our own.

There is no bottom, in the true sense, to the Kills. Drop your anchor and it sinks into filth. Bring a strain on the cable and the anchor hauls home as through so much molasses. The ordinary twenty five pound anchor held as well as could be expected, though the Coot slowly but surely was settling in shore. In 9ft. of water I could not veer to more than 6 fathoms scope for lack of room astern, so this danger of breaking away was thereby greatly increased. It was impossible to get underway and work across for a smooth under the opposite shore. I was alone, and to get the Coot under control with nothing but a close reefed mainsail in a steep jump called for two or three hundred feet of sea room for a safe venture, whereas only a hundred feet could be commanded. It may be said a lee shore should have been forseen, but the yacht had to be anchored inside of the fairway, which compelled a berth close in. There was no choice but to ride it out as things were and trust to the little Cherub who keeps an eye on luckless fellows in a scrape. He attended to business as the sequel will prove, but helped the Coot out only in the very last nick of time. I should prefer a little more margin for safety in the next case. Sunday wore on through anxiety which put nerves to severest tension. The wind screeched and howled, the day was dark and dreary, the sky tempestuous. Shower upon shower of rain would deluge the decks and pour into the cockpit with every passing squall. These came fast and furious. They fairly hit the Coot as they swooped down upon her without mercy. I could feel them strike the cabin house and shuddered in spite of all resolution. Moments seemed to stretch into hours; the hour into ages. The sea was running so high and the air was so cold that communication with the shore was impracticable. Not a being of any kind was to be seen. The far-off houses were bathed in torrents; the bare trees bent and quivered to the terrible scourging. The streets were ankle deep and choked with muddy debris; washed in riotous currents which forced a vent through lots and gutters, with great ferment as they tumbled into the seething breakers of the stream. No voice could have been raised above the appalling din. Signs or signals would not have been seen through the blinding storm, nor could help have been tendered that would have improved the state the Coot was in. Once a man did essay to walk across the railroad trestle, which formed a barrier between myself and the shore. With chin drawn down and coat above his ears, leaning forward, he pressed against the blast, but soon gave up the attempt and was quickly swept out of sight to seek shelter behind a shanty. A buoy a long way ahead was the only possible opening. I measured the distance with my eye and found it twice as long as my cable. Another buoy was some distance astern. This held out some hope, should the Coot drag still further. The rough sea and cold temperature left it an open question whether a line could be taken out, and that remained to be seen. For the present the anchor was holding, as the water had absolutely somewhat. But at each big sea it was certain that the anchor was being lifted, and at any moment it might break out altogether. In the mean time the cable was unbent from the folding anchor, which had been taken aboard and kept ready for use.

Once, late in the afternoon, there was a lull, and hope rose afresh that the blow had been broken. It was only a short-lived respite to the agony. Whizz! Down came the squalls anew with additional vigor. The caps of the waves were swept off and flew in showers against the Coot's cabin. She tugged heavily at her cable. She plunged and staggered. Rain froze into hail so cutting that I could not show head out of the doors and was driven below decks, a prisoner. The seas washed along the sides with hissing venom. The boat groaned under the infliction. The rudder mournfully moaned in its casing. The boom snapped and jerked in the crotch. The keel pounded a doleful dead march astern. The gear slatted a rattling accompaniment like musketry in battle. The timbers wrenched and the beams squeaked in complaint. The crockery clinked, the stores rolled about, the campchair tipped from leg to leg, the lamps swung violently in circles. The oil in the stove slopped over. The decks dripped from underneath. The board in the casing got uneasy. Little things fell out of racks and baskets. The matches slid out of the box and scattered over the floor. Pools of dirty water collected upon the oilcloth. The thermometer tried to break its precious neck. Water in the bilge sloshed round in ugly suggestion. Hail and gale raised an unearthly din, and the skipper—he sat coolly smoking. Let come what will, there was no help for it. Then in all the turmoil and war he broke out some plebeian sausage, peeled a few potatoes, boiled coffee, smoked, cogitated and turned in.

Daylight! Can it be possible! Have I slept? Slept through the whole of the night, through the violence and noise raging all about? But the gale? Blowing at its height, blowing with a terrific force which was sickening. During the afternoon, forty hours after the storm had begun, temporary relief came in occasional lulls. These grew longer, and again I foresaw the breakup of the gale. Streaks of light opened across the sky to windward. The rain ceased. The sea quieted down. So did I. When darkness settled upon the world it was inky black. The storm burst upon the poor Coot with renewed spite, accompanied by a terrific onslaught of hail. All night the howling tempest hurled itself upon the Coot. All night the anchor held. All night I slept. The gale was getting monotonous. Whoop! What was that? Another. How easy the Coot seems all of a sudden. What can it mean? Dragging! Yes, dragging, sure, and only a few lengths away from the hungry ogre ready to crunch the yacht into matchwood! Again she brought up and held all through Tuesday afternoon. She was but two lengths away from the trestle, over which the seas were breaking heavily. On Tuesday evening the gale broke. The Coot was safe.

THE CHALLENGE FROM THE ARROW.



NEARLY two months ago we published a letter from Mr. Tankerville Chamberlayne, owner of the famous Arrow, inviting a challenge from an American yacht for the Queen's Cup, won by the Arrow in 1852, in which race she beat the America. No answers to this challenge have yet come from American yachtsmen, and in order to draw their attention to this matter Mr. Chamberlayne has sent us for publication the following letter. The manly and sportsmanlike tone of Mr. Chamberlayne's challenge must commend it to our yachtsmen, and we hope, induce some of them to accept it. According to the claims that have been made for the seagoing powers of American yachts, the voyage is easily within their ability, and the advent of an American centerboard sloop in English waters next year, especially if she made a good showing in the races, would of itself be a sufficient refutation of the charges made against them from across the water. True, we have few large single-stick vessels, but it would be an easy matter to alter a schooner as was proposed last year. The Grayling, one of the fastest, is just about the required size, and the passage of such a boat across and back, whether she won or lost, would of itself be a grand vindication of the shoal draft theories held by many, and it would be, what the Puritan's victory was not, a triumph of distinctively American ideas. In the interests of international sport, we hope that Mr. Chamberlayne's offer will meet with a prompt response from this side of the Atlantic and that next season will see two international contests, one for a genuine Queen's Cup. As some alterations would be made in the Arrow in the event of a race it is necessary that a challenge should be sent soon in order to allow full time for preparation.

Editor Forest and Stream:

Will you kindly allow me to call the attention of American yachtsmen to a proposal I lately made in the columns of the London *Field*? I have reason to believe my letter was copied into several of your newspapers, but I should like to add a few words. The cup I offered to make a "challenge" prize was the gift of her Majesty the Queen to the Royal Victoria Y. C., and it was won by my cutter Arrow, then the property of my late father, the vice-commodore of the said club. The America was one of the competitors, and it is worth remarking that the Arrow was considered the fastest English racing yacht of that day, and that she was not beaten by the former vessel in the previous year, having been disabled by an accident and put out of the race. Thus the two vessels may be said to have met only once, and with the result above stated.

The other point of difference is that the cup won by the Arrow was the gift of the Queen, that won by the America was the gift of the Royal Yacht Squadron. I proposed, and now repeat the offer, to hold the Queen's Cup until some American cutter or sloop takes it from me. The best out of three matches in the Solent to decide the contest. I believe one of our crack vessels is likely to cross the Atlantic and try conclusions with you again next season, and if so no doubt your best yacht would have to remain at home and meet her; but the "old Arrow" (as she is called here) cannot claim, under the present system of handicapping, to be quite in the first flight, and there must be several sloops in your waters able to make a bold bid for my cup. Anyhow I hope I may hear from some gentleman among your yacht owners on the subject, and I will then lose no time in giving him all particulars. I ought to add that unless a contest is arranged before the 1st of April, 1886, I shall be obliged to withdraw my challenge till the following year. TANKERVILLE CHAMBERLAYNE.

CRANBURY PARK, Winchester, Dec. 28, 1885.

SAIL PLAN OF ICE YACHT "ST. NICHOLAS."

THE ICE YACHT ST. NICHOLAS.

NOT only the construction but the rig of ice yachts has undergone a very great change within a few years past. The old form of boats, shown in the upper left-hand figure, had the mast placed directly over the runner plank, with a very long boom. The new boats have the proportions of sail materially changed, the mast being stepped forward of the runner plank, as in the large figure. A third rig has also come into use, the lateen, shown in the upper right-hand corner. This latter was used some ten years since by Mr. Borden, of Fall River, who rigged two hickory saplings for masts, bending them to meet at the top. Later on it was adopted in a more complete form on the Hudson and Shrewsbury, and now a number of boats are rigged on this plan. The sail, a regular lateen, is hung from a yard supported by two sheerlegs, the latter usually stepped on the runner plank and raking forward at the top, being held by a backstay on each side, leading to the backstays from after end of centertimber to the runner plank. The rig shown in the figure is slightly different. The sheerlegs are stepped in a stout plank laid across the centertimber, and the backstays are led down to the runner plank. The boom is held down by a ball and socket, or similar joint on the centertimber, under the point of suspension of the yard.

The rig shown in the large figure is the one now most used. The mast step is an iron plate, screwed fast to the centertimber, from which a tenon, about 3×¾in. and 2in. high, projects. The mast is fitted with a heel band and is flat on the bottom, with a mortise fitting over the iron projection. There are two shrouds to each side, of ⅝in. wire rope, with 8in. deadeyes. The head of each shroud fits with an eye over the mast and rests on wooden cleats instead of hounds, a similar cleat aft supporting the forestay. The throat halliards lead down on starboard side to the fair leader shown below the mast, thence aft to the cleat over the runner plank. The peak halliards lead to the other chock and cleat on the same side. On the port side is the jib halliard and also the purchase for the throat. The jib tack is made fast to the clevis, *a*, in previous drawing (Dec. 24). The jib sheet leads from a block on the traveler, thence to block on club of jib, thence through the traveler block and aft through a ¾in. hole bored in the heel of the mast, making fast to the cleat just forward of the car. The main sheet leads from block on traveler, thence through block near end of boom, thence through block on traveler through an inner block on boom, thence to a third block on boom over fore end of car, and down through a block hooked into the eyebolt forward of the car. From here it leads through a hole in the car to a cleat lashed to the hand rail. The ends of mast, boom and gaff are worked down to rounded points. The mainsail is laced on the foot, but a traveler and outhaul are used to stretch the latter. The purchase for the outhaul consists of a cleat on boom with a sheave, and a fiddle block on the hauling part of the outhaul. The line is fast to the cleat, leads aft through the large side of the fiddle block, then forward over the sheave in the cleat, and aft through the second part of the fiddle block and to the cleat, where it belays. The canvas used on iceboats is very heavy, some being of No. 4 duck, as the sails must be set very flat. The dimensions of the sails and spars in the St. Nicholas are:

Mast, over all	27ft. 5in.
Mast, to jibstay	25ft. 8in.
Mast, to main rigging	2ft.
Mainsail, hoist	19ft.
Mainsail, foot	26ft.
Mainsail, head	14ft.
Mainsail, leech	35ft.
Mainsail, tack to peak	32ft.
Mainsail, clew to throat	31ft.
Mainsail, area	496 sq. ft.
Jib, luff	26ft. 3in.
Jib, foot	12ft.
Jib, leech	22ft.
Jib, area	131 sq. ft.
Diameter of mast at deck	5½in.
Diameter of mast at rigging	4in.
Diameter of boom	4½in.
Diameter of gaff	3¾in.

The iron work of an iceboat is not galvanized, but in the more expensive boats it is covered with varnish and silver bronze, the latter in the form of a powder, being laid in the varnish as the varnish dries. When not in use the boats are anchored by blocking the runners off the ice. It must be understood that in an ice yacht the boom is never far off the quarter, but that even when going to leeward the sheet is well in so that the stays and sheerlegs of the lateen rig are not in the way. The following are the principal boats owned on the Hudson River:

HUDSON RIVER ICE YACHT CLUB, HYDE PARK.

Yacht.	Owner.	Port.	Sail Area, Sq. ft.
*Ariel	A. Rogers	Hyde Park	187
Arctic	N. P. Rogers	Hyde Park	383
Avalanche	E. W. Sanford	Roosevelt Point	841
*Bessie	N. P. Rogers	Hyde Park	485
*Blizzard	A. Rogers	Hyde Park	634
Borcis	I. Grinnell	New Hamburg	
Cyclone	J. R. Roosevelt	Hyde Park	417
Dashaway	R. R. L. Clarkson	Tivoli	220
Fairy	L. Edwards	Roosevelt Point	448
Flint	Hopkins & Parker	Hyde Park	150
†Flying Cloud	I. Grinnell	New Hamburg	610
Galatea	R. R. L. Clarkson	Tivoli	410
Gracie	J. A. Roosevelt	Roosevelt Point	493
Great Scott	E. H. Sanford	Roosevelt Point	599
Icicle	J. A. Roosevelt	Roosevelt Point	735
Jack Frost	A. Rogers	Hyde Park	714
Northern Light	J. C. Barron	Roosevelt Point	680
Onteora	H. Livingston	Catskill	413
Puff	I. Grinnell	New Hamburg	
Reindeer	Beck & Kane	Hyde Park	731
Snow Flake	E. P. Rogers	Hyde Park	444

Flying Dragon	Irving Grinnell	378
Boreas	Irving Grinnell	319
Puff	Irving Grinnell	318
Meteor	J. F. Satterthwaite	349
Comet	J. F. Satterthwaite	387
Halcyon	Charles Le Roy	292
Vision	M. W. Collyer	390
Phantom	William Van Wyck	331
†Sophie	H. H. Hallock	280
Dart	F. R. Collyer	275

* Lateen. † Cat rig.

The following is a summary of the main races between iceboats since 1869:

1869—Haze, Aaron Innis, silver salver, $80.

1871—Ella, T. V. Johnston, silver pitcher, $100.

1872—Haze, Aaron Innis, club plate, $80; Haze, Aaron Innis, Booth Cup; Icicle, J. A. Roosevelt, Poughkeepsie challenge pennant; Haze, Aaron Innis, Roosevelt Cup, $125; Haze, Aaron Innis, ladies' pennant; Arctic, J. E. Buckhout, silver prize, $50.

1877—Restless, O. H. Booth, club colors; Hail, Aaron Innis, club colors; Snow Bird, Henry Bergh, Jr., Poughkeepsie challenge pennant; Gypsie, J. N. Winslow, silk pennant, $15.

1880—Avalanche, E. H. Sanford, silver prize, $50

1881—Gypsie, J. N. Winslow, ladies' pennant; Icicle, J. A. Roosevelt, club colors; Icicle, J. A. Roosevelt, silver tiller, $50.

1882—Avalanche, E. H. Sanford, silk pennant, $15; Gypsie, J. N Winslow, silk pennant, $15.

1883—Gracie. J. A. Roosevelt, silk pennant, $15; Avalanche, E. H. Sanford, club colors; Jack Frost, A. Rogers, silk pennant, $15; Avalanche, E. H. Sanford, silk pennant, $15; Avalanche, E. H. Sanford, silk pennant, $15; Helen, Norman Wright, Poughkeepsie challenge pennant; Avalanche, E. H. Sanford, challenge pennant of America; Haze, Aaron Ionis, Rogers Cup, $100; Jack Frost, A. Rogers, challenge pennant of America.

1884—Gracie. J. A. Roosevelt, silver box, $50; Avalanche, E. H. Sanford, club colors; Jack Frost, A. Rogers, second regatta for Barron Cup.

1885—Northern Light, J. C. Barron; first regatta for silver prize; Northern Light, J. C. Barron, second regatta for silver prize; Haze, Aaron Innis, challenge pennant of America; Northern Light, J. C. Barron, challenge pennant of America; Northern Light, J. C. Barron, Edwards challenge pennant.

As yet the season, usually counted from December 1 to April 1, has not begun, but the boats have been ready for some time and the present weather promises a speedy inauguration of a most successful racing season.

THE BONITA'S CRUISE TO FLORIDA.

AS mentioned last week another catboat, the Bonita, is bound on the same cruise as the Coot, her destination being Jacksonville, Florida. The idea of such a cruise was first suggested last summer in the following manner; We had been trolling for bluefish, and getting well along toward night and coming on to blow southwest hard, Capt. Ned recommended we make for Cuttyhunk. We coincided and Capt. he squared her away. Conditions changed by 9 P. M., we were then half way between Hen and Chicken and Sow and Pigs Lightships and found we would not have a good harbor at Cuttyhunk, so old Charlie suggested that we make Pennikesse harbor; Capt. Ned had never been there but allowed we had buoy charts and we could find our way in through the dark where we would have good harbor. The morning found us well up in the mud, and on going ashore for water we ran up against Capt. Flanders (in charge of the island), who, having lately returned from God's country (California) reckoned we had gone astray, but old Charlie squared him by convincing him that he used to visit his father there when whalers were sighted almost every day and never a hell wagon (steamboat) was around.

Then Captain Flanders opened out, and all Buzzard's Bay knows when he is on deck he has the call. While reclining on the hilltop with the morning sun caressing us, the idea for a winter cruise were suggested for the Bonita, and it was decided to make the trip. The day of starting, Dec. 21, 1885, opened clear and cold, thermometer 20° above, wind W.S.W.

Newport Harbor presented a sight rare to summer yachtsmen, familiar with it under summer conditions. Not a vessel was to be seen in the harbor, and as the Bonita sailed at 11:30 A. M. and fired her battery she looked and acted as though eager to leave this cold clime for softer skies.

She passed out by Permanent dock (Fort Adams) at 11 A. M. Wind settled dead S.W. at 11:30 A. M. and we beat up to and rounded Beaver Tail and made for Narragansett Ferry for anchorage, laid by there in good harbor through the storm of that night, blowing a gale N.W.

Dec. 22. Started at 5 A. M. with wind S.W. and beat to windward and rounded Point Judith and arrived in Stonington at 6:40 P. M.

Dec. 23. Started out and made New London 10:15 A. M., laid by until next morning.

Dec. 24, 8 A. M. Wind light west; beat up to Saybrook at the mouth of Connecticut River, laid by until 5 P. M., then sailed to westward with light wind north and made Falkner's Island light at 3:30 P. M., wind fresh N.N.E. Came up with Sandiedge lighthouse at 10:30 P. M (off New Haven, Conn.); we kept the canvas on her and were abreast Stratford light 12:30 midnight.

Dec. 25. At 1:15 A. M. we were off Black Rock, with the wind freshening. At 3 o'clock A. M. we took in our mainsail and set storm trysail. We ran along up to Great Captain's Island and were abreast of it at 5 A. M., and at 7 A. M. rounded Throgg's Neck and ran up the East River to Brooklyn, and laid until afternoon, when we sailed over to Jersey City at 4 P. M. for mail and waited until next morning for it.

Dec. 26. Sailed from Jersey City at 3 P. M., wind N.E., fresh and clear, and making some ice, laid all night at Red Hook.

Dec. 27. Ran down to Sandy Hook, wind fresh and clear, north. There we dug some clams and had steamed clams for supper.

Dec. 28. Sailed from Sandy Hook 10 A. M., wind N.N.W., fresh. Abreast Squan Inlet at 12 M. Barnegat 6 P. M., wind N.N.W. fresh and cloudy. Lay all night at Barnegat.

Dec. 29. Sailed from Barnegat 5:30 A. M., wind light W.N.W. Made Tucker's Beach Light 11 A. M. and Absecom Light 12:30 M., passed Jumbo 2 P. M. and Great Egg Harbor 4 P. M., made Somer's Point 4 P. M., wind light N.W. Laid all night at Great Egg Harbor.

Dec. 30. Sailed from Great Egg Harbor and arrived at Delaware Breakwater midnight.

Dec. 31. Sailed from Delaware Breakwater 6 A. M. and ran down to Chincoteague Lighthouse, Va., at dark.

Jan. 2. Ran up to Chincoteague Harbor to fit for run to Hog Island in the morning.

THE CRUISE OF THE PILGRIM.—III.

BY DR. W. H. WINSLOW.

THE next morning Frank started home. We were sorry to lose him because he was a willing worker, good sailor and pleasant companion. It left me with the four boys—very ordinary seamen—but still they had picked up some knowledge of sailing principles and ship duty, and I concluded to trust to them for help the rest of the cruise rather than hire a stranger. The departure left us more room and more labor, but the boys seemed to learn faster and work better because of my dependence upon them and their added importance. They were getting very salty. They could tie many sailor knots, tell the points of the compass, shift the sails, balance upon the foot-ropes, steer a little and pull pretty good strokes. So I kept up naval duties and division of labor. Jack often had very greasy pans to wash, but one by one they were accidentally lost overboard. Jamie wished occasionally to postpone his dishwiping, but I did not yield the prerogative of the quarterdeck. He ejaculated one day after a wiping struggle, "I never knew what servants had to do before. I think any one who has to wash and wipe dishes ought to have $10 a week."

It is serious trouble to clean up after cooking on board a small boat, and the work should rotate among the amateur sailors or else all ought to take a hand and finish quickly. When one camps on shore there is more fresh water, more room and a chance to dry the towels. It is difficult to have the towels washed out and dried on board. We never could get them dry between meals, and we left a string of them all the way from Cape Ann to Cape Rosier. Greasy dishes and smoked and rusty tins are destructive to them. Tins are not to be recommended for salt water cruising; the granite ware is preferable for cooking utensils, and porcelain dishes are much easier cleaned and do not often get broken. And clean paper makes excellent dish and wiping towels for cold washing. We found this out by experience—it absorbs grease and removes soot so well. One can't always have fresh water, or hot water, at sea, when the oil stove is cutting capers.

Another thing I will mention. When the cooking, eating and sleeping are all done in a small cabin, blankets are a nuisance. Their wool is sure to get into the food and all over everything. If one must have woolen covers, shawls are better. But neither is necessary. Everybody on a cruise sleeps in his merino underclothes and overshirt, if not in his pants, to guard against the dampness and cold, and to be ready for emergencies. Common cotton quilts are of sufficient warmth and most manageable.

We landed at the yacht club float and were received and escorted by the very polite janitor over one of the best adapted and prettiest yacht club houses in the United States. It is built high above tide upon piles, and has a lauding stage under and in front of it, with steps leading up to a balcony, and an elevator through the middle of the house for taking up all the tenders for winter storage in the broad attic of the building. The main floor is divided into lockers, a toilet room, officers' rooms, and a very cosy assembly room overlooking the harbor. Here they have handsome office furniture, lounges and easy chairs; fine yacht models, photographs and marine views upon the walls, a book for the record of visitors' names, and a fine telescope upon a tripod. I turned the glass upon the Pilgrim and saw Jamie munching hardtack. She lay among two dozen small yachts near the opposite shore, where no other vessels come, and the water either by agreement or command is allotted to the pleasure craft, and a sheltered, shallow, safe anchorage it is, where no one need fear being run down even if the anchor light is forgotten. We left orders for a new hatch, which was sent on board in the afternoon. A wrought iron staple was clinched through the center of the thick oak, and this was lashed to a strong bar beneath the coamings, which kept it aboard ever after.

I was not much impressed by the Portland club vessels. They were mostly old sloops of shallow draft, with broad sterns, clumsy rails, large trunks and deep cockpits. A deep cockpit with high staving always looks to me like a cattle yard—as if the helmsman was breachy. I noticed too much paint, coat upon coat, which made the craft look bad. Scrapers and sandpaper ought to be used freely upon the outside of a boat before she gets her season's paint. The Portland club is young yet, and there is no doubt the members will soon have a handsome fleet to correspond with their beautiful club house.

Portland is a pretty city upon a hill nearly surrounded by water, and the people are proud of Casco Bay and its numerous well-wooded islands. It is a fair, though limited cruising grounds, but has more rocks and reefs to the square mile than any other place known. The islands are too thickly settled for trespassers and campers, and are long and narrow and trend northeast and southwest, so that there are very few sheltered harbors in the region. This formation is peculiar to the coast from Portland all the way to Whitehead and is annoying. Long narrow islands and finger-like processes along a past parallel far to the north, and the long reaches and sounds are difficult and tedious to make progress in with a head wind. I don't like to be penned up. I want a passage onward at least in the direction of the four principal points of the compass, and I would not be cramped for hours by the nearly parallel shores of Middle Bay, Harpswell Sound, the Gurnet, etc., for all the pleasure of seeing new shores. Then it is so difficult to find a quiet harbor in case of need. Potts' Harbor is one redeeming feature of Casco Bay. It is snug, safe and lovely. I don't like Harpswell for a northeaster, and where else could a stranger go in the sound? Then to the eastward it is worse if anything. The Kennebec River is difficult, dangerous and even appalling in a south easter. Booth Bay next is excellent. Herring Gut is rather poor, somewhat difficult of access, and quite a distance from the last place. Tennant's Harbor is a little ways further and will do, then there is not a good safe place for small craft till we reach Rockland. One must make the run from one of these places to the next every day to enjoy life. He had better get inside at anchor every night. The winds are fitful and often fierce along this rough coast, and the few near-by stopping places should make him cautious. Fishermen run in everywhere, but an amateur yachtsman cannot. He must keep in well mapped and clearly marked channels. One trouble is one cannot often recognize the islands when seen for the first time. How can one tell the White Cow from the Brown Bull and the latter from the Little Bull Island. The names are not characteristic; the islands look upon the watery plain almost in a line, and one cannot always take the time to figure out the bearings by compass. It is my opinion these natural landmarks ought to have their names painted upon mammoth sign boards for the instruction of amateur yachtsmen.

Taking into consideration all the difficulties and dangers of a trip in a small vessel along this ragged coast, I am not surprised that so few amateur yachtsmen undertake it.

We got under way—or started to—at 3 P. M., but when the mainsail was up the club signal was hauled half through the upper peak halliard's block. No amount of pulling would help, and Bert said he would go up and clear it. He had never been aloft, and I was dubious of his ability to do anything up there. However, he went up, held on well and worked away. Then he called for a nail and the hatchet, with which he drove out the pin of the block, removed the sheaves, liberated the flag untorn, put the block together again and came down triumphantly. We then made sail and stood up past Fort Georges, Little Hog and Great Hog islands, intending to find a pleasant anchorage near some green and wooded shore; but the wind fell and darkness overtook us just at the lower end of Little Chebeag Island, and we were obliged to anchor, furl sails and hang out our light. It began to blow hard from the northwest after sunset, the sea rose, and we were obliged to veer cable to twenty fathoms and get the heavy anchor ready for an emergency. The evening meal was cooked with difficulty, the wind piped and the little craft pitched considerably, so we passed an uncomfortable night, with the boys one at a time on anchor watch and the captain dozing with his weather eye open. The morning came, the breeze died away, and as I was in doubt of the passage out I sent Bert and Will ashore to a summer hotel for information. The people told them that we could not get through the place we intended to go on account of a bar; I suppose they thought we wished to pass between the two Chebeags. The compass courses that had been given me by the gentlemen of the Portland Club led in the direction of the bar, and when I looked at the Atlantic "Coast Pilot" charts for instruction I found to my astonishment a gap of, perhaps, four miles.

I did not dare to follow the sailing directions alone, because my compass was not lively, and it was a little affected by the iron aboard, besides, without a chart, there would be no means of recognizing the islands, and the rocks were too plentiful to take the risk. I was in a quandary, and felt inclined to swear at the Government for its neglect of so important a survey. I could not find Cow Island—it was not labeled—and I did not know Long Island. I was disgusted at my neglect to buy a good chart of Casco Bay. The "Coast Pilots" are cheap—sixty cents a number—but they need supplementing in places. I did not wish to go back to Portland and go out the main channel. A general chart on too small a scale showed a good passage out of Hussey's Sound, so I abandoned my idea of going through the bay and determined to put to sea. The wind was very light. I steered down along a pretty shore with many summer cottages, and kept a sharp lookout ahead for shoal water. Pretty soon we recognized Peake's Island and Overset upon the larger chart, and steered for Inner Green Island. We watched a schooner pass between the buoys of Outer Green Island and Green Island Reef, and soon after a large iron steamer, bound for Portland, tried to pass to the northward of the buoy, struck on the reef, raised her bow high out of water, backed off, turned aside and proceeded upon her voyage. We passed midway between the buoy and the inner island and shaped our course for Half-Way Rock Lighthouse, which looked like a tall gray pillar upon the horizon. The breeze freshened about 10 o'clock and we changed the course to east, which cleared Webster Rock and Lumbo's Ledge and brought us up to Fuller's Rock, off Cape Small Point. Half-Way Rock is a small barren ledge, with a fine lighthouse and two miserable little huts upon it. It is about five miles off shore, and is a dreary, desolate place for human beings to reside in.

Fuller's Rock is a black forbidding looking object, looking somewhat like a whale upon the water. There is a channel between it and Cape Small Point for vessels with a fair wind, but I did not like to venture into it. I like plenty of sea room, better than dodging rocks and reefs. Small Point is well named, as it is too small to be easily located, and from sea does not look like a point. Bald Head, just west of it, is a much more conspicuous object. It is a bald, steep headland without grass, bushes or trees, and its face appears to be a mass of solid gray rock.

Fuller's Rock is very conspicuous and easily recognized, and when you get hold of one place that you can find upon the chart, it is a guide to many others.

It was a lovely sunshiny day; the wind was strong from the S. W.; the sails were all full and drawing beautifully; the sea was dancing along after us, rolling the cutter now port, now starboard, the sun flashed in the sunlight as it struck against the rocky shore and gave a deeper shade to the evergreen trees that covered the whole islands and prominent hills inland; the boys lay about the deck and watched the gulls, porpoises and passing sail, or slept in the shadow of the mainsail, and I sat at the helm, proud of my little boat, and just soaked in the sunshine and breathed in deeply the air, which seemed to penetrate the innermost recesses of my anatomy like good champagne. I thought how good it was to commune with nature upon the great deep, and how greatly we were enjoying every moment of the cruise. Several times I said, "Boys, you are having a splendid time, if you only knew it. You will look back at this trip, as one of the finest times you ever had, and forget all the hardships which you suffer."

"If there was only a servant on board to wash the dishes," said Jack.

"And some one to wipe them," said Jamie.

"And a boss French cook, though I'm willing to do my share," said Will.

"Oh, get out! You'd rather cook than wash down decks," said Bert; "I'm satisfied to do anything to have such a splendid sail, to see this coast as we never could in any other way, and learn geography. Just think of the places we've visited and learned all about so far. Think what is to come yet."

We were up with the cape and there was Seguin Island high, bold, wooded and crowned by a light-house and the keeper's dwelling. We expected to stay over night in the mouth of the Kennebec, but it was only 1 P. M. We would go outside of the island and try to make Booth Bay. The course was changed, the sails trimmed, and we flew on merrily. I wish to say en passant that the writers who recommend anchoring inside and behind Pond Island in the mouth of the Kennebec ought to be kicked. The current of the river with the ebb tide makes a rush of water between the island and the shore that few ground tackles will hold against, and the holding ground is sandy and not of the best. The place is exposed to the ground swell all the time, and whenever there is a storm, the sea sweeps through with terrific force. The island upon the side is a wall of rock, and the shore of the mainland is one of those treacherous, shoal, sandy shores that we find along the southern coast—a pretty trap for a nice little craft to harbor in. Don't trust it.

Stage Island Bay, upon the right hand, just inside of Whale Back, is a good shelter except when the wind is between west and south. But it is a kind of pocket; one has to come out the same way he goes in, and it is open to the heavy wind and sea. It might do in an emergency, but I do not like it. It would not always be safe, and would not be comfortable for a small craft during a storm.

The mouth of the river is a bleak, rocky, forbidding, dangerous place, and many a good vessel has been wrecked there. In seeking a harbor there, exercise good judgment about the wind, the current, and your vessel; run up river and anchor close in to Phippsburg, and you will find comfort, supplies and the presence of man.

We passed a large wrecking schooner off Seguin, with beams across, chains leading downward, steam pumps and engines and a crew of divers and men, trying to lift some unfortunate vessel that had sunk in fifteen fathoms of water. The people hardly noticed us, but a man answered my question, "How far to Booth Bay!" by 'About twelve miles."

So we sped on the pleasant summer sea with flowing sheets, and after awhile, the low gray bank along the horizon showed many vessel masts that later turned to trees, then a house could be seen here and there, some little hills, sloping banks, a wharf, a sandy shore, and I recognized the characteristics of Damiscove Island. We ran up along the land looking for a lighthouse and saw two. Which was the right one to steer for, as directed in the Coast Pilot? The beacon on the Cuckolds and the compass pointing north to the further one proved it was on Burnt Island, and we steered for it. The one to starboard was upon Ram Island, just north of Fisherman's Island, which marked the eastern limits of the bay. We were soon close to Squirrel Island, which lies in the middle of the bay and has become a noted summer resort, especially for Bath and Portland people. It has bold rocky shores, with one little stretch of sand beach left, one would think, on purpose for bathing; it is high, well wooded upon its southern half, has a good wharf, several cosy hotels and many lovely summer cottages and more pretentious villas. I think I never saw a prettier cooling off spot anywhere, and I have no doubt the place and society are delightful during the warm season. It was August 28, and charming weather, but the place was deserted, and I thought how much the visitors lost by going home so early. September is the most enjoyable month of all the year for vacation, and just when the heat of the sun is toned down by cool sea breezes, the grass turns brown, the evergreens look darker, and the beeches and maples flutter all the colors from flaming scarlet to shining gold, the lovers of nature have fled to put the poor, overworked children into the cram school and themselves into the harness for business. It is the school time, not the business generally, that hurries them away. The people ought to move the beginng of the schools to October 1st, and give the children and themselves a chance.

[TO BE CONTINUED.]

THE LAWS RELATING TO STEAM YACHTS.

ON the 5th inst. the bill amending the revised statutes relating to yachts, which was published in the FOREST AND STREAM of Dec. 24, 1885, was presented before Congress by the Hon. Perry Belmont, of New York. The bill has been slightly changed since printed, the definition of a yacht now reading as follows: "A yacht is a vessel of any size, propelled by sails, steam or any other motive power, which is used by its owner for pleasure purposes, and which does not carry passengers or merchandise for pay. Such vessel to be entitled to the privilege of this section must be duly enrolled in a duly incorporated yacht club, the title and certified copy of the act of incorporation of which must be filed with the Secretary of the Treasury."

Steam yachts of all sizes and classes have heretofore been subject to the general laws governing steam vessels, laws passed before steam yachts were in existence, and which, though since amended, do not recognize in any way the vast difference between an expensive and carefully constructed pleasure vessel, run at the sole risk of her owner and used only under certain conditions; and the large fleet of steam vessels used solely for commercial purposes, in many of which the greed of gain induces owners or masters to expose not only underwriters, but passengers to great risks. Whatever restrictions are necessary in the latter class, there is no reason why they should be imposed, as they always have been, on vessels of a totally different nature.

Any abuse of the privileges accorded in the proposed act is prevented by the clauses quoted above, which limit them to yachts as there defined, and make it to the interest of all clubs to protect their members and to extend their guarantee to no vessel used for any commercial purposes.

Under the present laws, steam yachts, which in their cruises call at all ports in the United States, find much annoyance in going from one inspection district to another, while the regulations of some States allow the imposition of unjust and excessive pilotage, harbor and other charges. What is now asked by the friends of the bill is that a yacht, hailing from New York or Boston for instance, and that has complied with all the requirements of the laws in her district, shall be at liberty to enter any other port without undergoing the expense and annoyance of inspection and the imposition of dues which as a pleasure yacht she should not be liable to: and also that an owner or his designated agent, after giving sufficient proof of his competency, shall be licensed to act as master or pilot in all districts. The provision that owners shall give suitable bonds, and the conditions as to incorporated clubs, limit this privilege exclusively to vessels in which the owners take the sole risk. As the property involved usually runs well up in the thousands in value it is not to be supposed that an owner will risk it by the employment of incompetent men. These two restrictions also make it impossible that the proposed changes should discriminate in any way against trading vessels, as they cease to affect a vessel as soon as she is used for any commercial purpose.

The clause in regard to steam launches is becoming each year more necessary as their use on sailing yachts is increasing. The simple launch engines now in use may be safely controlled by a yacht owner or sailing master and one of the crew; but at present an engineer must be carried, an extra and useless man on a sailing craft, whose services are only required at intervals when the steam launch is in use. The management of small boats of this class may be safely intrusted to owners and masters, as a rule far more intelligent and capable men than the cheap engineer whom the law now puts in their place. The bill, if passed, will do much to encourage a branch of sport that has already grown rapidly into a very important industry, and that must exert a large and favorable influence on shipbuilding and naval design in America, which of itself should entitle it to every consideration.

YONKERS Y. C.—At the annual meeting of the Yonkers Y. C., held Jan. 7, the following officers were elected for the ensuing year: Charles E. Day, Commodore; N. P. Quick, Vice-Commodore; Gabriel Reeve, Secretary; John Nesbitt, Treasurer; John Dickson, Fleet Captain; Wm. H. McVicar, Measurer, and Charles Ryder, Steward. Frank Ford was re-elected Trustee.

KNICKERBOCKER Y. C.—A meeting of the Knickerbocker Y. C. was held on Jan. 5, at which the following officers for 1886 were elected; Commodore, G. K. Rosenquest; Vice-Commodore, L. Lefferts; Steward, James Simpson; Fleet Surgeon, Dr. E. Ringer. Board of Directors, Messrs. W. Potter Jr., J. Tagliabeu, J. Paxson, Harris and Charlton.

SEAWANHAKA C. Y. C.—A special meeting was held at Delmonico's on Jan. 5 to consider the difference between the Board of Trustees and Vice-Com. Stewart. After some discussions a special committee was appointed to arrange a settlement of the disputed points.

A NEW TORPEDO BOAT.—Messrs Thornycroft & Co. tested on Dec. 14 a new torpedo boat 125ft. long, one of fifty lately orded by the British Government. An average of six runs over the measured mile gave 20.9 knots per hour.

Canoeing.

THE NEW YORK C. C. CHALLENGE CUP.

Editor Forest and Stream:

At a committee meeting of the New York C. C. the rules governing the races for the N. Y. C. C. challenge cup were finally adopted. These rules as amended include those covering the international races, and the races by which the American contestants are to be chosen. There has been considerable misunderstanding among the members of other clubs as to the meaning given to "representatives of the N. Y. C. C." as it appeared in former published conditions. This was not intended to be read as meaning members of the N. Y. C. C., as many have supposed, but chosen members of any club representing the N. Y. C. C. in these races with the Englishmen.

CONDITIONS GOVERNING THE RACES FOR THE N. Y. C. C. CHALLENGE CUP.

1. The canoes competing must come within the limits defined by the N. Y. C. C. rules.

2. The cup is to be held as a perpetual challenge trophy.

3. The competition is open to not more than three authorized representatives of any canoe club sailing under foreign colors, as many canoes representing the club holding the cup as the challenging club.

4. Two victories to be necessary to either win or hold the cup, the same canoes competing in each.

5. The races to be sailed on the waters of the club holding the cup.

6. Races sailed in the United States to be contested on waters in the vicinity of New York city under the auspices of the N. Y. C. C.

7. The distance sailed over in each race must not be less than eight nor more than ten miles and within a time limit of three hours. The course to be mutually agreed upon.

8. The races must be sailed at a time mutually agreeable to the challengers and the holders of the cup; but one series of races to be sailed in any one year.

9. The N. Y. C. C. rules to govern the races.

10. The club holding the cup to be responsible to the N. Y. C. C. for its safe keeping. Should it dissolve its organization, the cup will then revert to the N. Y. C. C.

CONDITIONS GOVERNING AMERICAN CONTESTANTS.

11. The representatives of the holders of the cup must be selected after a series of trial races open to all members of canoe clubs in the United States. The regatta committee of the club holding the cup

shall have the right to select the competitors for the international races irrespective of the result of the trial races.

12. Should the cup be won by the American contestants in the International race: First, an active member of the club holding the cup must score one victory to entitle that club to retain it. Second, if a member (or members) of any other club wins two races, his club will hold the cup. Third, should the two races be won by members of two clubs, neither being the holder of the cup, the tie will be sailed off subsequently to determine which club shall take the cup.

C. J. STEVENS, Sec. N.Y. C. C.

THE SNEAKBOX FAMILY.

II.—THE BARNEGAT CRUISER.

THE cruising fraternity of America, whether they use the birch, the dugout, the modern canoe, the common rowboat, or the sneakbox, all who cruise alone or in small parties solely for pleasure, owe a debt of gratitude to one man above others for the work he has accomplished in their behalf. Himself an ardent cruiser and explorer he is never so happy as when engaged in some scheme for the extension of cruising or the improvement of boats. After several long cruises this gentleman, Mr. N. H. Bishop, then of Lake George, started in 1879 to organize the canoeists of America into one national canoe association, with what success is now well known. With the A.C.A. firmly organized and in good hands his labors were at once turned into a new but parallel channel. Residing for a part of the year on the New Jersey coast, Mr. Bishop was perfectly familiar with the boat described in the FOREST AND STREAM of Jan. 7, and recognizing its many excellent qualities he set to work to improve the gunning boat into a craft better adapted for general cruising. As a result of his untiring efforts in this new field the American Single Handed Cruising Club has been organized, with a membership of fifty. The boat herewith described, the Barnegat cruiser, has been designed and for some time past has been undergoing a series of tests as to model, build and rig; and an extensive establishment has been started to build them.

As previously mentioned, the sneakbox is essentially a gunning boat, and many alterations were needed to fit it to the wants of the cruiser. The low sides have been raised, the dagger board has been supplanted by a steel-plate board, the crude fittings, rowlocks, etc., have been replaced by brass and iron work of special manufacture, the primitive rig has been discarded for more improved forms, and the method of construction has been changed in the direction of less weight. The model of the hull is the same as that of the best sneakboxes, except the increased depth; and the washboards, in an improved form, have been retained.

Dimensions of Barnegat cruiser:

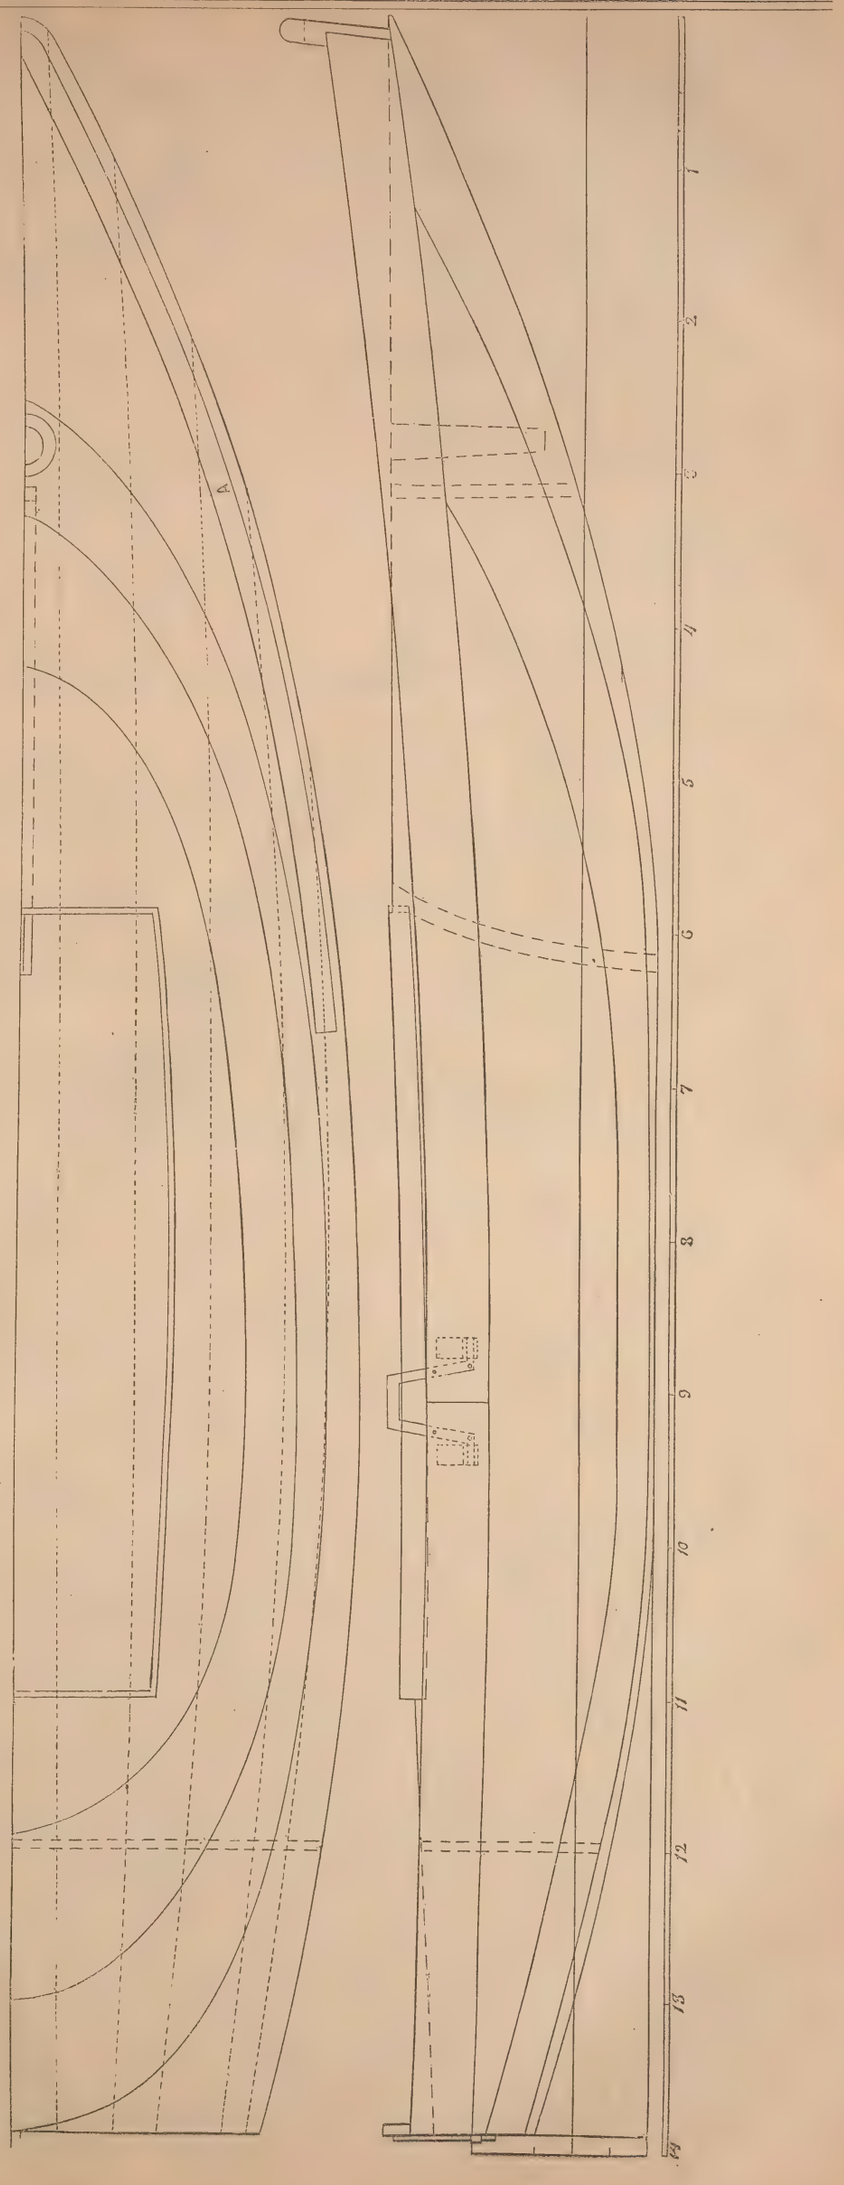
Length over all	14ft. 0in.
Length on waterline	11ft. 9in.
Beam	4ft. 6in.
Depth at gunwale	1ft. 1in.
Sheer, bow	8¼in.
Sheer, stern	4in.
Draft, loaded	6in.
Freeboard	7in.
Crown of deck	8in.
Fore side of stem to—	
Mast tube	2ft. 9¼in.
Trunk, fore end	3ft. 1in.
Trunk, after end	6ft. 3in.
Well, fore end	5ft. 10in.
Well, after end	11ft. 0in.
Rowlocks	9ft. 1in.
Bulkhead	12ft. 0in.
Diameter of mast tube	3in.

TABLE OF OFFSETS—FOURTEEN-FOOT CRUISER.

STATION.	HEIGHTS.		HALF-BREADTHS.			
	Keel.	Deck.	Deck.	No. 1.	L.W.L.	No. 3.
	FT. IN.	FT. IN.	FT. IN.	FT. IN.	FT. IN.	FT. IN.
0	1 9⅛	1 10	.....	.....	.....	.....
2	11⅛	1 6⅝	1 1	.....	.....	.....
4	3⅝	1 4⅛	1 8⅞	1 3	9 7	.....
6	.....	1 2⅜	2 1⅜	1 10⅛	1 7⅜	1 3⅜
⊠	.....	1 1	2 3	2 0⅝	1 9⅞	1 6
10	.....	1 1⅜	2 2⅝	2 0⅜	1 9⅛	1 5⅜
12	3⅜	1 1⅝	2 0⅛	1 8⅝	1 3⅛	.....
14	9	1 2	1 9⅝	.....	.....	.....

Note.—The fractions are all eighths of an inch.

The stations are 2ft. and the waterlines 3in. apart.



The planking is of ⅝in. cedar, deck of ⅛in. cedar, frames of sawn cedar 1⅛×1¼in., spaced 10in. Ceiling of ⅛in cedar, trunk of ⅞in. worked pine, head ledges ⅛in. thick, of oak. The keel is shaped, bent and screwed to the stocks as previously described, the moulds and transom are put in place and ribbands run over them, three on each side. The framing and planking of all this class of boats are very peculiar. The planks do not end in a rabbet in the stem, but run up to the gunwale. The dotted lines in the body and half-breadth plans show the different planks. The actual breadth of a plank on any frame may be measured on that frame in the body plan. The lines in the half-breadth plan are the projections of the plank on a flat surface, and except for the keel and garboards, they vary more or less from the proper shape. The after ends of the planks are screwed to the transom, as in an ordinary boat, but some support is necessary for the fore ends while building. To secure this two harpens, A, are lined out from the draft on the floor, each fitting the inside surface of the planking at the lower side of the deck. They may be of pine or spruce 1in. thick and 2in wide, and long enough to reach to the straight post near midships. These pieces are now fastened in place, their fore ends being screwed to fore end of keel, while the middle and after ends rest on the moulds, being jogged in to the proper height. When in place the topside of each harpen will coincide with the lower side of deck, while the outer edge, properly beveled, will coincide with the outer surface of the moulds and ribbands or inner surface of the planking.

Now the frames, either steamed or sawn, are put in place, secured to the ribbands, and the heads of the first five or six on each side are fastened to the harpens. This completes the frame for planking. The garboards run along, of course, on each side of the keel, turning up at the fore ends, where they are screwed to the harpens. The succeeding planks are put on in the same way. When all are made and rivetted up the moulds are removed and the deck beams, 1in. wide and 1½in. deep, spaced 10 inches, are put in. The ends rest under the harpen, being jogged out the thickness of the latter, so that the upper surfaces are flush. Knees, as shown, are put under the side decks, then the deck is laid and coamings set, and the boat finished as described in "Canoe and Boat Building." The mast is stepped in a galvanized iron tube. The washboard is in five pieces—two on each side and one (the latter held by two square staples) on the stern.

The side pieces are bolted to an iron casting at the bow which forms a fairleader for the cable. They are held to the deck by small iron catches, shown at *a b*. The part *a* is pivoted, and when turned aside allows the washboard to be slipped back from *b*. The bottom of the boat is protected by two wearing strips of oak. The rowlocks are of galvanized iron. The builder of the Barnegat cruiser is Mr. John D. Gifford, Toms River, N. J. The price of the improved boat, 14ft. long, with rig and oars, is $128. The boat is fitted with a balance lug sail of 118ft., a plan of which will appear later on.

A smaller boat lately completed and now used by our correspondent "Seneca" is 13ft. long, with jib and mainsail, of the following dimensions:

Mast—Deck to hounds	11ft. 2in.
Hoist of mainsail	8ft.
Foot	13ft. 9in.
Head	5ft. 6in.
Leech	13ft. 10in.
Jib—Luff	8ft. 6in.
Leech	7ft. 9in.
Foot	2ft. 6in.

THE A. C. A. TROPHY.—*Editor Forest and Stream:* I beg to acknowledge this week: M. V. Brokaw, Brooklyn C. C., $1; Charles S. H. Buchanan, New Orleans, $1; previously acknowledged, $72. Total to date, $74.—WILLIAM WHITLOCK.

RIGS FOR THE BARNEGAT CRUISER.

AFTER thoroughly testing the Barnegat sneakbox with her rig of a balance lug sail, I found in going to Fernandina in a blow that she steered very hard, and when close-hauled did not do what she ought in going through the water, and on my return to Jacksonville I made a rude jib of very light sheeting and rigged a rough bowsprit out foward, leaving the mainsail as it formerly was, part forward of the mast. Made a trial of this and saw an immediate improvement. I then estimated the amount of cloth I would need in a jib with the mainsail set entirely abaft the mast with a regular boom and gaff. I made neat little jaws for each, rigged throat and peak halliard in one and had a nice well-sitting jib of proper dimensions made from drilling, and then set up everything in ship-shape order. The effect was astonishing, instead of crabbing off to leeward with a big pocket (all aback) forward of the mast, the Petrel now slides up to windward like a Snake. I have everything rigged very handy now, and can house the jibboom in a second without any trouble at all. My mainsail sits beautifully, and I am much pleased with the very great improvements in the Petrel's sailing qualities. I made the suggestion to rig her this way when she was being built, but objections were raised and I did not insist, knowing that I could soon make the change to suit myself. The little Petrel elicits much admiration by her snug appearance and trim "sea going" looks.

Two of us have been living on board for two weeks—cooking, eating and sleeping. I hope to send for publication soon, diagrams and all detail information regarding my cruising outfit, which I consider very complete and which I trust may do the cause some little good.

PETREL.

[Those who have lately tried the balance lug as fitted to the Barnegat cruiser make the same complaint as Petrel as to the defective balance and failure of the sail to sit flat. No such difficulty has occurred with canoes and much larger boats on which the balance lug is successfully used, and before condemning a sail that has so many advantages it would be well to test it thoroughly. We hope when the weather permits, to put a large balance lug, rigged as for a canoe, on a sneakbox and to ascertain the source of the trouble which others have experienced.]

WIDE AND NARROW CANOES.

Editor Forest and Stream:

Allow me to say to "Class B Canoe" and others, that the present discussion of beam versus crankiness was commenced by my asserting that "the canoe as now limited in beam is neither safe, handy nor comfortable for sailing purposes."

This statement was made advisedly. It is nothing more nor less than the truth, and is known to be such by every skilled amateur sailer of small boats. However, "Class B" accuses me of "dodging" questions, dealing in "generalities," etc. In reply I will remark that I never could reply seriously to foolish queries, but will add, "returning to our sheeps, "that no boat, be she canoe, sharpie, sneakbox, or what not, can be either safe, handy or comfortable with a length of 15ft., beam 31in., and carrying say 175 to 215 sq. ft. of sail, on a draft of 6in. of water.

The fact that certain little craft are forced to cruise about under such circumstances certainly does not prove them to be safe, and in truth they can not be made to stand up at all in a breeze without constant watching and the most skillful handling. Their dimensions answer the questions at issue, and an intelligent boatman need never have seen one of these little racing machines to decide the matter without hesitation. If my instructive remarks have chanced to burst somebody's bubble, why I suppose he will have to blow another.

Now, my friends, let us clearly understand this question. I do not propose or desire that you give up your cherished and pretty little bath tubs, for if you do so, many an amusing account of capsizing and ducking would be missed. I merely suggest that those who prefer wider and better sailing canoes may be permitted to own and sail them as a separate and recognized class in the A. C. A. To one, who, like myself, has time and again cruised entirely alone in a 48ft. sharpie, it seems amusing indeed to hear a man say seriously that any little 16ft. canoe requires two men to handle her. Just pause and reflect how damaging to your cause is such an admission. Why, the double ender I am now building, 15ft in length, and to carry some 215-sq. ft. of cloth, can readily be handled by a boating boy twelve years old.

A word with "Class B Canoe" in regard to certain unkind remarks of his concerning my little sharpie's race with "Guenn" and, enough said. He speaks of my sharpie as a "large sail boat, with racing sail, beating a jury-rigged canoe in little more than a drifting match. Well, it may have been drifting as to the canoe, but my sharpie (which, by the way, is a small 15ft. sail boat) managed to easily stem a strong tide, and under those circumstances sailed to windward at the rate of five miles per hour. As to her "racing sail," it is the same that I have since used on her without reefing in heavy weather while duck shooting alone on Long Island Sound. If "Guenn" carried a "jury rig," why did he do so? The match was of his own making, and I informed him in advance that my sail was large. If he underrated the sharpie he only made the same mistake that mayhap "Class B Canoe" and "L." etc. are perchance now making as regards the "common sense canoe."

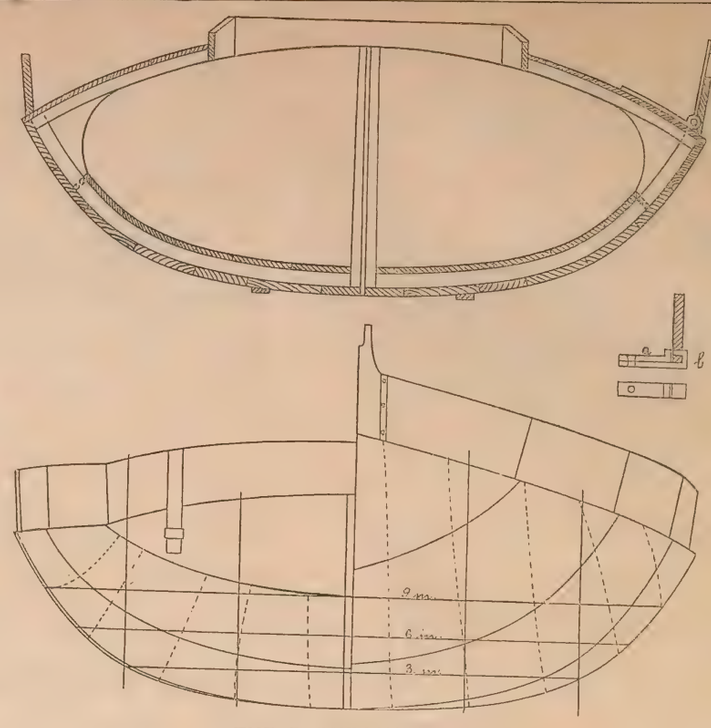
THOMAS CLAPHAM.

ROSLYN, L. I., Jan. 1, 1886.

Editor Forest and Stream:

"Katrina," in your issue of Dec. 31, asks a fair question that should in all courtesy be answered. It is in regard to the canoes I referred to in "Longshank's" list. As between the two canoes, I think Day Dream would be benefitted by getting into a class away from the Dido. This is simply an individual opinion, and must be taken as such, for opinions differ, you know. As to the other canoes he mentions—Sea Bee and Inertia—I know nothing personally, further than having seen them in use. How was I to know they were "twins" when the dimensions given were not the same, especially as you know in canoe classification fractions of an inch count as much as feet in larger "yachts"? "Katrina" also says that I have given him the credit of being narrow minded. I think not. I don't like personalities brought into a friendly chat, and if my memory serves, the expression used was "narrow" minded—simply a reference to the "narrow" canoe views so ably championed by himself and others as against the "wider" canoe ideas.

I am afraid "Katrina" must have some "bricks" at disposal, for certainly a big one fell over this way when he says "especially such cool assumptions as that of the weight of a 42in. boat being no greater than one of 30in. beam." The assumption in this case lies with "Katrina." I think if he will take the trouble to look over his file again he will find this: "and I also think that it would not take any more men to handle her than it would to handle a canoe of same weight" I see no reference here to 30in. canoe or 42in. canoe or any other size. I am perfectly willing to father anything that I may say or write, but I confess I don't care to be responsible for another's inferences or assumptions. If I remember correctly the belief I put forward was in reply to a question put by "A. C. A.," which was in reference to handling the larger canoe in transportation. The average canoe of to-day as usually packed, "chuck full," hatches down and locked, will weigh anywhere from 150 to 200 pounds—a light estimate that, too. The larger boat, as suggested, with fittings, masts, sails, etc., I don't think will weigh any more, quarter master's and commissary's stores not included in this last, and taking them weight for weight, it will take as many hands to handle the one as the other.



Personally "Katrina" admits in answer to question one that, "there is no objection in their proper place"—referring to the larger canoe or rather wider canoe, for as yet I have heard no suggestion to increase the length limit. The second question simply resolves itself into, why not make a proper place for them within the A. C. A. circle? That is all. On my part, there is no favoring this man's model or that man's model. What I was getting at was this—the objection to enlarging the present limit so as to take the wider canoes—a distinctive class of sailing craft.

Every one has individual preferences. This is so in canoeing as in everything else. One man prefers a small paddling canoe, another's choice falls on the comely class B canoe, and still another might prefer one still larger for his own particular purpose. Good A. C. A. men all, and yet the latter receives no encouragement, except to go and join some single-handed cruising club. Is this generous? Now I have no personal interest other than the interest of fair play. Perhaps I may be all wrong in my view of the matter, but I fail to see why the paddling canoeist, the general all-around canoeist and the sailing canoeist could not dwell together in unity the same as the two former do now,

Lest I should be misunderstood, no thought is further from my mind than crying down the present canoe as unfit for its purpose. I also wish to be understood as not crying up the wider canoe at the expense of the narrow. So, no keelhauling for either of these offenses, if you please.

I do think, however, that there are virtues in the wider canoe that might make it preferable for some to use her; that those who do prefer the wider canoe may be true canoeists at heart, and valuable acquisitions to the A. C. A.; that no harm would arise from such additions from the rolls; that none of the present classes would be injured by adding another class to take in these wider canoes—sailing canoes distinctively; that without compromising any present interest it could be done, and the A. C. A. circle of good will, good fellowship and good canoeists extended considerably.

This is my personal platform on the question. It contains no "Whereas" and no set of resolutions. I have tried to be plain and trust to be understood. As to which is the better boat that is another question entirely, and one, too, that can hardly be settled satisfactorily by the most protracted discussion. Both the narrow and wide

THE BARNEGAT CRUISER.

have their good points and both have their faults. What one person would look upon with favor, another might think a serious fault. To my mind the question of size and model is controlled to a considerable extent by the waters to be sailed on; second, by the purposes for which the boat is to be used. And both of these considerations are wiped out and thrown aside by the canoeist's own sweet will.

Fair play all around and no favor is all that is suggested by HAL.

A CHAT ON SOME CHANCE TOPICS.

ON the evening of Jan. 6 a one-horse wagon slowly entered the pretty village of Toms River. A new sneakbox rested between the "bolsters," and as nearly every boy above twelve years old in this nautical locality can sail a "box," much interest was immediately manifested in the little white boat. The oldest sneakbox builder in Ocean county and his assistant walked beside the horse, and, with a switch in his hand touched up the weary animal. The party had traveled since daylight—twenty-two miles from the southern end of Ocean county. The men and horse were to return home during the night.

As the "box" was consigned to the commodore of the "American Single-Hand Cruising Club," it soon leaked out that this craft was the fast sneakbox ordered by the building committee of the A. S. H. C. C. two months ago. By the time the boat had reached the Commodore's house, on the left bank of the river, inside the town limits, an interested crowd of sneakbox men and yacht owners had gathered to welcome the little stranger. All present expressed strong approval of the possibilities concentrated in the 14ft. of length and 54in. of beam measurements in the well developed hull. The boat was placed beside the water and Mr. Chamberlain, the professional tester of sneakboxes and Barnegat cruisers for the club, promised to rig the boat early on the following morning, and if the wind blew a gale on that day he would "make her sides ache" before night.

This is the first sneakbox of the pure type that has been built for speed only on this part of the coast. The sails, jib and mainsail, have been completed for some weeks in anticipation of the trial of the craft. Another set of larger sails are being made for the purpose of proving the extreme limit of sail area which can be carried by this type of boat.

The improved type of sneakbox, called by Mr. N. H. Bishop the Barnegat cruiser, is built for comfort and safety, and he will not allow the club's builders to sacrifice the best cruising qualities of these staunch craft for racing purposes. He has, however, made contracts with two builders to develop a fast model of the sneakbox and as soon as the winter tests, which are to be made with the craft just received from the builder, have proved her virtues and faults, six 14ft. fast sneakboxes are to be built.

Mr. Bishop has one builder in Burlington county, New Jersey, preparing working plans for two 16ft. Barnegat cruisers and one racing sneakbox of same length. All these boats are to be finished and put into the waters of Barnegat Bay as soon as the ice is out of the bay. South of the Toms River estuary Barnegat Bay is usually free of ice by the middle of March.

The rough weather tests of the able little craft belonging to the American Single-Hand Cruising Club can be made with more dispatch in the early spring months, during which season three days out of every week are boisterous enough for exhaustive trials. As the FOREST AND STREAM has made noble efforts to separate the chaff from the wheat, the sham article from the genuine, in all matters relating to honest boat and yacht building, the members of our amateur clubs now cruising on distant southern waters will cheerfully coöperate in promoting this great and important work. We regret that our former friend, counselor and teacher in safe sailing and honest seamanship should have been beguiled into "cooting" in an ungainly catboat. As we read in the FOREST AND STREAM of his many trials, and even sufferings, while "cooting" southward in that big, unmanageable catboat, now going about the wrong way, now anchoring itself on a mud flat, left there by an ebbing tide when he might have been cruising like a sailorman in a deep cutter off Hatteras, where the water is deep—and all this suffering from the stern fact that cutter owners will not sell their prized craft and catmen will all sell out at 50 per cent. discount. When all this horrible picture is spread before our shoal-draft eyes the deepest sympathy takes possession of our hearts. When we fully realize that our brave leader has thus been imposed upon by the owner of that unfortunate cat, and his voyage of contemplated joys is proving gall and wormwood—with tears in our eyes we implore him to sell out and wormwood—with tears in our eyes we implore him to sell out upon his arrival at any port inhabited by men of feline tastes.

The commodore of the Single-Hand Cruising Club said to the writer of this only yesterday: "The 'Cruise of the Coot' is the best reading of the season; but while 'it is nuts for us,' it must be hard for our old leader." If I had known that the auther of the "Cruise of the Coot" contemplated going over my old cruising ground, I would have insisted upon his accepting my best Barnegat cruiser. He then might haul up on shore at night, or sleep at anchor with the hatch tent set over his decks, as George E. Andrews is now doing in the Barnegat cruiser Petrel in Florida. With light, strong oars the cruiser could have been rowed under the Brooklyn Bridge, and its occupant could have shaken hands with the hermit of Marmalade Lodge that same night instead of anchoring with a Chester anchor in soft mud bottom at the Navy Yard, and in the route of tacking coasters. The author of the "Cruise of the Coot" will prove, however, how unhandy and time-wasting a cruiser is a heavy catboat, too large to be easily rowed out of calms and ebbing tides, and too deep with all her flat floor to cruise in Florida waters. In cruising, first comes the light, easily paddled canoe. In its peculiar field nothing can take its place. Second—the small, beamy, light draft sneakbox, which can be sailed well and rowed easily. On this craft live; it is your home, with all the kits, tents, guns and duffle you choose to carry It is portable. One horse can haul a 16 footer at same expense as a canoe.

Now, oh cruiser, stop! do not run into extremes. Do not build your sneakbox longer and heavier than you can row it with ease. Remember the "bone of discord" we canoeists have been trying to swallow. Remember that we have tried to build a yacht to be called a canoe; and having built it and having found it too heavy for the paddle, we have raised in our peaceful fraternity the question, a sore one: "Is this abnormal canoe, a canoe at all at all?" When your sneakbox or Barnegat cruiser cannot be propelled by oars easily, stop there, and draw your line of limit as to length and weight of model. But you say, "I wish to cruise with companions in shoal and in deep waters. I must have something as comfortable as a scow or canal boat, yet this something of a craft needed must go to windward. A scow or canal boat will not do." Then go to Mr. Clapham. Instead of abusing that gentleman (and he is a gentleman, every inch of him) visit him at Roslyn, L. I. Though a teacher in yachting matters, he is open to conviction. He is a learner as well as instructor. You do not know that this educated gentleman, who has lately adopted his new profession of boatbuilding, has been an experienced amateur of wealth, has owned some very fast boats: has gone boldly to sea in his shoal draft craft, is working out at his own expense, one of the problems which costs money and weary brain-work—the development of a light draft, comfortable, home-like boat, adapted to the constantly changing depths of our seaboard interior water courses.

When we differ from another worker in our chosen field, let us not waste the precious space of FOREST AND STREAM by "going for that fellow" with printer's ink. Let us rather put our hands in our pockets buy a railroad ticket, and "go for that fellow," meet him face to face, examine the work in his shop. Let him explain all his "wheels within wheels." We will return home wiser and happier men. There is nothing like personal contact. When you write your next article for our medium of friendly fellowship, its tone will be friendly and you will praise the efforts your fellow is making, to promote the healthy and manly pastime of boating. Let us, fellow cruisers, work in harmony. Remember what Commodore Longworth said to the twenty-three canoeists gathered in the first camp of the A. C. A. "We have organized the American Canoe Association, it is to be a brotherhood. If any man here has any complaint to make let him free his mind now; after this there is to be no fault finding. We have smoked the pipe of peace. Let us work for the true interests of canoeing." Should not these words of peace apply to the one great brotherhood enrolled on the subscription list of FOREST AND STREAM? We belong to many clubs, but there is one flag that floats over us all, and that is FOREST AND STREAM.

SKIPPER.

MOHICAN C. C. ANNUAL MEETING.—At half past eight on Jan. 4, fifteen Turtles met at the residence of Commodore R. S. Oliver, 42 Willet street, to consider the annual reports of their officers for the year just elapsed, Captain Thatcher in the chair. The club is in a fairly flourishing condition, having twenty-eight members with twenty-three canoes, owning one club canoe and the finances in good shape. The official business of the evening was the election of club officers for 1886, which resulted in 15 votes for R. S. Oliver as captain, 13 for H. R. Pierson, Jr., and one for R. W. Gibson as mate, 14 for B. Fernow and 1 for R. W. Gibson, as secretary, 10 for W. H. Brown and 6 for H. Cushman as purser, and 15 for H. L. Thomas as member of the executive committee. Messrs. W. Baden Powell and E. B. Tredwen, the English canoeists, expected for the 1886 meet, were elected honorary members. R. W. Gibson produced a drawing of his newly to-be-built canoe, with which he intends to contest for the Cup against the visitors. The lines of this new craft met with general approval. An equally enthusiastic applause was accorded to a brown paddler named Turkey, who tried to float on a liquid commonly called cerevisia, but he had evidently forgotten the old saying: "*Cerevisiam bibunt homines, cetera animalia fontem*" (Men drink beer, the other animals water), for he disappeared rapidly under the brown waves. Singing by the accomplished president of the Ridge field Athletic Club and Winne's Newburgh Whistling Song with "Roll the Man Down" filled up the rest of the evening.—FERNOW.

ANSWERS TO CORRESPONDENTS.

F. H., W. B.—Casselton, Dakota.

R. C. M.—Any one of the larger calibers named in our table of last week will do.

E. A. S., Bottleboro, Vt.—Nearly all well bred beagles have very musical voices.

E. T. S., Brooklyn, N. Y.—Bang Bang is owned by the Westminster Kennel Club, Babylon, L. I.

W. H. B.—The rifle is pushed to make way for the newer magazine gun with a different action.

G. S. K., Oregon.—Van Dyke's book on still-hunting is a reliable and practical work, the best of its kind.

SILVER BULLET.—The Yellowstone Park is in Wyoming and Montana Territories. It contains 3,575 square miles.

WYOMING, Pa.—The fact that your dog has no known pedigree does not preclude registration in the *American Kennel Register*.

A. L. O.—You can probably have your gun polished so that it will shoot all right. If you are not within access of a reliable gunsmith, send the arm to some of the firms advertising in the FOREST AND STREAM and get an opinion on it and estimate of cost.

W. L., Carlisle, Pa.—I would like to have a book which would give a description of different birds and birds' eggs. Ans. We know of no satisfactorily completed work on the nests and eggs of birds. We would suggest your getting Gentry's "Nests and Eggs of Pennsylvania Birds." 2 vols.

H. H., New York.—Will you kindly inform me or let me know where the largest ranches are situated, how many head of cattle, owners, etc. Ans. Large cattle ranches are confined to no particular section of the West. Montana, Wyoming, Colorado, New Mexico, Utah and Nevada all contain them. Some companies own over 100,000 head.

J. T. W., Waterbury, Vt.—1. At what age does a cocker spaniel weighing from 15 to 25 pounds reach maturity? 2. At what age should a cocker pup's tail be docked and how much should be taken off, and how should it be treated? Ans. 1. At about two years. 2. When one or two weeks old take off about one-third. No after-treatment is necessary.

X. Y. Z., Havana, Cuba.—I send you by to-day's mail a sea duck about the size of a green teal. Please to say to what species it belongs. Ans. The bird is a female lesser scaup duck or little blackhead (*Fuligula affinis*). It is found throughout North America, breeding from the borders of the United States northward, and migrates as far south as Central America and the West Indies in winter.

FOX-TERRIERS.

The Clovernook Kennel offer the following high-bred terriers, by

SPICE, winner of over fifty cups and specials in England, including F. T. C.'s grand challenge in 1881, 1883 and 1884, at Oxford, Preston and Manchester. Also winner of A. F. T. C.'s cup for best terrier, ditto silver pitcher, ditto silver pitcher with Delta for best pair at W. K. C.'s show, N. Y., 1885, and

SCARSDALE, winner in 1884 of 2d, W. K. C., N.Y.; 1st, Chicago; champion, Montreal; 2d, Philadelphia; 2d, non-sporting show in 1885; 2d, New Haven; 2d, W. K. C., N. Y.; 1st, Cincinnati, and 2d, Philadelphia spring and autumn shows. Sire of Scarsdale Joe, winner in puppy classes in 1885 of 1st, New Haven and special; 1st, Boston, and 2d, W. K. C., N. Y.

One dog, black and white, whelped July 5, 1885, by Spice ex Priscill (dam of Scarsdale Joe), by Joker ex Warren Bessie. Price $30.

One dog, black and white, litter brother to above. Price $30.

One dog, black and white, whelped July 8, 1885, by Spice ex Clover Blossom, by Dynamite Joe (by Belgrave Joe) ex Puzzle (by Buff). Price $50.

One dog, black and white, whelped July 19, by Scarsdale ex Delta, by Belgrave Joe ex Rank (by Rasper). Price $25.

One dog, white and black spots, litter brother to above. Price $25.

One bitch, black and white, litter sister to above. Price $15.

Spice was undeniably the best fox-terrier of his day.

Scarsdale's blood is valuable as an out cross from Belvoir blood and for handsome markings.

ANSWERS TO CORRESPONDENTS.

THE ADIRONDACK DEER.

A MOVEMENT is on foot to secure the repeal of the non-hounding law. Unless the friends of the deer rally to support the present statute it is quite probable that the change will be made. The condition of affairs this winter at Albany may be said to be favorable for the success of those who are plotting the destruction of what deer are left in the North Woods. Speaker Husted, as our readers have had occasion to learn, is out and out an advocate of deer hounding. He has made up the game law committees in a way favorable to the hounders. The members intrusted with the task of repealing the law are already hard at work pledging the members to vote in favor of their bill when it comes up. Everything goes to show that a well-planned attempt will be made to loose the hounds once more.

The strongest possible proof of the wisdom of the law is found in the character of the opposition provoked by its operation for a single season. While all intelligent and unselfish Adirondack residents and visitors are pleased with the measure and rejoice that a period has been put to the disastrous and brutal water-butchery, there is a small class of guides who are the enemies of the law because it temporarily reduces their income, and these men are joined by equally improvident hotel keepers and stage drivers, who have in the past depended on the water-butchers' patronage. These men have nothing to offer against the law, except that it does actually do what was intended, namely, protect the game. So they have resorted to misrepresentation and falsehood to bolster up their cause, as, for instance, the grotesque assertion that more deer were killed in 1885 by still-hunting alone than had been killed in any other recent year by still-hunting and hounding combined.

The actual dissatisfaction with the law is not widespread nor shared by a class of men whose knowledge of the subject and honesty of intention give them a claim to consideration. But there is a possible danger that by their activity they may induce the Legislature to grant their demands and repeal the present law. This scheme must be defeated. We repeat what cannot be too strongly urged, that each friend of the Adirondack deer law must make individual exertion to influence his representative at Albany, if the present wise law is to be maintained.

We hear of a number of new deer laws which are to be introduced at Albany. Some propose one thing and some another. But the evident purpose of each one is to put the hound again on the trail and the boat on the lake. The abolition of jack-hunting would be a capital measure, but it must not be done at the cost of the present non-hounding law. To forbid the marketing of venison would be another most excellent provision, but it must not be made at the sacrifice of what we have now. To shorten the season is well enough, but to shorten the season and turn the hounds loose is what the bill means. No law which does not forbid hounding will be adequate to the needs of the North Woods to-day. Do away with jacking, shorten the season, forbid the killing of deer, stop marketing, but do not legalize hounding and clubbing.

GOOD BUFFALO HUNTING.

A MAN from London, England, came into this office last week to learn where he should go for good buffalo hunting. He was told to go back five years, which was another way of saying that the days of buffalo hunting—good or bad—have gone by.

An occasional report comes to us of a band of buffalo having been seen here or there, but always with the added caution that they are probably not to be found in the locality now, for such and such a party has been after them.

Practically the buffalo has passed from the realm of zoology into that of paleontology; it now belongs to the domain of the closet naturalist.

Here is a bare commercial fact which tells the story: Buffalo robes are now shipped from New York to Fort Benton, where they are sold for $25 and $30 each.

FOREIGN GAME FOR LONG ISLAND.

IT is proposed to introduce hares, pheasants and partridges to the Long Island covers and to restock the island with deer. The country is admirably adapted to such an enterprise. The success which has attended the introduction of these foreign birds to New Jersey preserves is sufficient encouragement for a like undertaking on Long Island. The game will undoubtedly thrive there if it can only be protected from destruction by gunners. The first step then is to secure a law providing for the immunity of the imported game. Such a bill was introduced at Albany last Tuesday by Mr. Huntting, of Suffolk county. It is a wise and very necessary measure and should pass without opposition. Until such a law is enacted no one will be found foolish enough to spend money for foreign birds for the first gunner who comes across them to pot. If Mr. Huntting's bill is made a law, there will probably be little difficulty in securing a subscription large enough to make the importation on a satisfactory scale.

There ought to be a law of similar character to protect such species of large game as may be introduced into the Adirondacks.

THE GAME.

A CURIOUS feature of last autumn's shooting was the almost entire lack of a fall flight of woodcock. This was probably due to the fact that there was up to the close of the season no severe frost to drive the birds south, and it is likely that they lingered about their accustomed feeding grounds until after the season had closed. Their passage would then be unnoticed. As noted already, the fowl shooting has been very unsatisfactory up to the present month, owing to the unusually mild weather. But little was done along the southern seaboard until the great freeze which took place about ten days ago. This closed the waters of the Chesapeake and its tributaries, but for a short time made splendid shooting in Currituck Sound.

The first part of the winter was so mild as to be very favorable for the quail supply. What the effect of the recent cold snap was is not yet fully known, though there is every reason to suppose that the game suffered severely. The extraordinary cold in the South must have been terribly destructive, for the quail of that latitude are not so hardy as the northern birds, and it is probable that great numbers must have perished. In the North the season has been a good one; there have been so far none of the severe storms nor crusting, which is so surely fatal to the birds.

Reports which have come to us from a number of widely separated localities indicate that a fair supply of ruffed grouse were left at the end of the season for the next year's supply. The indications are that a number of sections from which of late this bird has been absent, are becoming restocked, and good shooting if once more the rule. This is true of parts of New England and it is true of the covers of the Western Reserve.

CITY AND COUNTRY.

MOST of the larger and more influential game associations have their headquarters in the cities and find their chief support there. Their work has to do with the country; and it frequently happens that their efforts are in a large measure hampered, if not entirely thwarted, by the jealousy and misunderstanding of country residents. For example, the Massachusetts Fish and Game Protective Association, as its name implies, has for its field the entire Commonwealth, but they are continually meeting opposition from persons in the country, who are unwilling to believe that the "city fellers" have anything but their own individual and selfish ends in view. Every measure introduced into the Massachusetts Legislature through the efforts of the Association is viewed with suspicion and distrust by the country members, who generally manage to thoroughly misconceive the purpose of the bills and oppose them under the mistaken notion that they are working in the true interests of their constituents.

As a matter of fact, city associations and country residents have the same end to attain. What is for the good of one is also for the good of the other. They are mutually dependent and it is a great pity that there should be between them this misunderstanding and pulling at cross-purposes, which defeat the interests of all. There should be nothing but harmony between them. Might not this be secured by a system of country membership in the city society?

SMALL BIRD DESTRUCTION.—Elsewhere will be found a report of the organization and purposes of the committee appointed by the American Ornithologists' Union to consider the protection of North American birds. The Union has taken action none too soon. We have repeatedly called attention to the magnitude of the destruction of song and insectivorous birds for millinery and decorative purposes, and it is encouraging to see that the subject is beginning to attract the attention it deserves. We hope that the A. O. U. committee will receive in this work the popular support and aid it certainly deserves.

THE NEWARK CHILDREN who went to Paris to be treated by M. Pasteur have returned. What the trip amounted to no one can tell, for it is not known whether the dog which bit them was rabid or not. The probability is that the dog was not mad, and the children had their trip for nothing. Meanwhile the effect of the newspaper hydrophobia sensation is daily proving more monstrous and cruel. Cases of alleged hydrophobia are reported, but they are nothing more than the nervous result of the newspaper hydrophobia agitation. For such deaths the editors and not the dogs are accountable.

GAME PROTECTOR J. L. BRINKERHOFF, of the Ninth district, has added his signature to a printed circular alleging that it is impossible to detect the game law offenders. This is exactly the view which was taken by a number of residents of his district last season, with this modification: that it was impossible to stop deer hounding—with Brinkerhoff as game protector. So they hired a special officer of their own, and he did the work. The law may be defective, but it makes a big difference who is charged with its enforcement.

THEY WILL BE POWERLESS THEN.—By lobbying, scheming, trading, misrepresentation and wire-pulling the advocates of Adirondack hounding may secure the license to drive deer into the water and butcher them there. After it is all over and the last unhappy animal has been clubbed to death, no amount of lobbying, scheming, trading, misrepresentation and wire-pulling will restock the woods.

STATE GAME PROTECTOR WM. H. LINDLEY, of Canastota, has made an excellent record for himself and has won the confidence of the citizens of his district. He is a fearless and efficient officer, and should be reappointed for another year.

AMONG THE RARE OLD VOLUMES included in the London book sale of Christmas week were Gilbert White's own copy of "Selborne," with numerous autograph letters, and Izaak Walton's "Lives," with MS. corrections by the author. They brought big prices, but then what treasures they are.

TOMAHAWK THROWING as a winter sport is suggested by a correspondent who thinks that if a war-post be set up in a barn or hall the average young man of the day will prove inferior to his red brother in "accuracy and length of cast."

TO THE WALLED-IN LAKES.

VII.—THE SIGN OF THE CROSS.

THE next morning we determined to move camp. Another white man had come into the valley, and established himself on the St. Mary's River just below the lake. We were anxious to make one or two short excursions into the mountains, and did not like to leave our camp unprotected over night while there were so many Indians about. We therefore decided to move all our possessions down to the temporary home of this white man, who would look after them in case of our absence for a day or two. Before leaving camp we cached the boat and oars in the brush, and afterward carefully obliterated all the tracks which we had made in the operation.

By 10 o'clock all our preparations were made, the wagon was packed and we started. We had looked out a road a day or two before, and found no difficulty in taking the wagon along near the shore, over ridges and across water courses. On our way down we met a number of Kootenays, with whom we stopped and gossiped for a while. They were going off into the hills to visit their beaver traps, of which they had a great many set on all the best streams. They are good trappers, and at this time the camp was averaging ten beaver a day.

A mile or two before reaching the lower end of the lake I saw a long, shallow bay, protected by high banks from the furious wind which was now blowing, and taking the shotgun, rode down through the willows nearly to the water's edge, and then dismounting stole down to the shore and peeped out through the brush on to the water. At first no ducks were to be seen, but as I gradually advanced I caught sight of something moving in a little cove on the left, and turned, just as three greenwing teal jumped from the water. By good luck rather than good judgment I caught two of them close together, and dropped them with the right barrel, while the third was stopped with the left as he was crossing a little gravel bar that ran out from the shore. The retrieving of the first two was a tedious operation. The mud was very deep, and I was obliged to build a sort of causeway of brush and sticks to support my naked feet as I waded out to get them. All this took some time, and when I rode out of the willows again the wagon had disappeared, and as I neared the ford I saw it drawn up by a lodge on the opposite bank. I rode toward the place where we had crossed the day before, and where the water was only about up to the horse's belly, intending to cross there, when Yellowfish stepped out of the tent and made a gesture to me. It afterward appeared that it was only a salutation, but I interpreted it to mean that I could cross directly from where I was to the camp, and so I rode down the bank and into the water. It looked deep, but I went ahead with confidence until the water was half way up to the horse's back, and I had my feet tucked up behind me in the saddle. Even then I trusted that we had reached the deepest part, when suddenly Jerry stepped off into a hole and began to swim. I climbed up as high as possible and kneeled on the saddle, but that did not save me from being wet nearly up to my waist. A few yards swimming brought Jerry to his footing and I landed, and was received in the camp with a good deal of merriment by the witnesses of my swim.

We found Dick King, the owner of the lodge, very hospitable and kindly disposed. Indeed, he insisted on our moving our beds and most of our traps into his lodge, which, after some protest, we did, using our tent thereafter only for cooking and eating in.

That afternoon we dined in the presence of six or eight Indians, who, after we had finished, soon demolished whatever was left.

They sat down to eat, and after their food was before them, and when blankets had been thrown back, thongs of quirts slipped from the wrists and sleeves tucked up, each one removed his hat, and, with uplifted eyes, gravely and reverently made the sign of the cross and whispered a prayer.

The performance of this simple rite here in the wilderness was indescribably pathetic and eloquent. Whence came their knowledge of God? Who told them the story of the cross? Had they learned it from the priests of our day, or was it a survival of the teachings to their tribe in the long ago by the old Spanish missionaries?

To these Kootenays it was surely but an empty form, for they worship the sun; but though these prayers have no significance to them, to their forefathers they were full of meaning.

The sight carried my thoughts back over centuries of time, and I followed the holy Fathers, as with all the pomp and circumstance of glorious war they entered Mexico with the old Conquistadores. At first they made their converts by the sword; later their unflagging zeal and patient faith subdued tribe after tribe, until at length they reached the western ocean. Slowly they spread along the coast north and south, and to the outlying islands of the sea, and planted the cross deeper and deeper in the wilderness. In trackless deserts, in tangled forests, they preached Christ and His Kingdom. The wild tribes of the parched cactus plains, the more gentle races of the Pueblo villages, the hardy fishermen of the seashore alike yielded to the faith and energy which inspired these ministers of God. Little by little they made their way up the coast—you can trace their progress on the map to-day, San Diego, San Pedro, Santa Barbara, San Luis, San Jose, San Francisco, San Juan—ever fighting the battle of the cross, upheld by their faith. The blazing sun of summer poured down upon them his withering heat; they did not blench. The frosts and snows of winter chilled them; they pushed on. Sky-reaching mountains barred their progress; they surmounted them. Floods stood in their way; they crossed them. Painfully, slowly, on foot, through an unknown country, in perils of waters, in perils by the heathen, in perils in the wilderness, "in weariness and painfulness, in watchings often, in hunger and thirst, in fastings often, in cold and nakedness," they held their steadfast way. No danger daunted them; no difficulty turned them back; death did not stop their march. If one faltered and stumbled and fell, another stepped calmly forward and took his place. No need now to look at the means they sometimes employed, nor to remember that among these servants of God all were not worthy. Look only at what they accomplished, and at what a cost. And though their earnest labors failed to establish here in the New World the religious empire for which they hoped, yet no doubt each faithful soul had, in the consciousness of duty well performed, if in no other way, his own abundant reward.

Something of the feeling that must have animated these men is expressed in some lines written in the shadow of an old Spanish mission by my friend H. G. Dulog:

The mission bell is tolling slow
In the still afternoon,
And from the stuccoed front of snow
Reflected sunbeams glare and glow,
While through the cloisters broad and low
A strayed bee drones his sleepy tune.

The Provence roses' attar scent
Comes from the garden's crumbling walls,
And with their heavy breath is blent
Odor of flowers on boughs still bent
With yellow limes, and warm content
Upon the drowsy spirit falls.

A faith outworn, a work decayed,
Show here their ample fortune's trace,
And the brown-featured band arrayed
In worship where their fathers prayed,
Express in tones that fall and fade
The pathos of a dying race.

An old Franciscan wanders by
With sandaled feet and long gray gown,
His head is drooping pensively,
But in his dark and steady eye
There lies a slumbering energy
Which, waked, could win a world's renown.

Why should this Cæsar's vital eyes
Guard a few stolid Indians' fate?
Surely his spirit in him cries
To burst his chafing bonds and rise—
Pants for the struggle and the prize
That crowns the strong and patient great.

Why molder 'mid the living dead
To snatch from fire one worthless brand?
Does the kind sky above him spread
Pour down such peace on that gray head
That he finds sweet the bitter bread
Of strangers in a foreign land?

It must be that he reads the thought.
He stops his walk, and with a smile
He speaks: "My son, our fight is fought
With many arms. If good be wrought
To the great cause it matters naught
Where we must post the rank and file.

"In Orient old; in states yet new,
Whose broad foundations scarce are planned;
In crowded towns; where far and few
The settlers' rough-hewn cabins stand;
On Arctic ice or tropic sand;
Where Holy Church has work to do
God's servants find their native land."

From the coast the Fathers wandered inland almost to the main range of the Rocky Mountains, preaching the Gospel, and among their converts were the Kootenays; and here still the sign of the cross and the vesper bell reminds the wanderer of a time—now long past—when faith was strong, and men were willing to die for God's glory. Here on the shores of the St. Mary's lakes, among the ragged peaks and far from the haunts of men, is still practiced a rite of the church; here still grows, though stunted, deformed and changed, the plant whose seed was first sown centuries ago by that devoted band.

Toward evening two of us rode over to the Kootenay camp, on Swift Current, and called on old Back-in-Sight, the Chief. He is a fine grave old man, of majestic presence, yet with a kindly gentle face which quite won my heart. We found him sitting in his large clean lodge in which burned a bright fire, and at one side smouldered a few coals upon which from time to time his wife scattered a few needles of the sweet pine. The fragrant vapor rose in white clouds toward the smoke hole, and its perfume filled the lodge, and those who entered went to this smoke and held feet and hands over it, and taking handfuls of it rubbed it over heads, arms and breasts, so that they might be purified and evil spirits be kept off. We asked the Chief something about the grand mountain whose solemn peak pointing so steadfastly toward heaven was visible from the flat where we were camped. "Some of my people long ago," he said, "climbed to the summit of Chief Mountain. The Kootenay medicine is very strong, and we can climb bad places. When any animals get on top of this mountain they become crazy and jump off over the cliffs." This may mean that there is but one way to reach the summit, and if an animal is driven up there and its return is prevented, it jumps over the cliffs, and in avoiding capture meets its death on the sharp rocks far below. Yellowfish declares the summit of the mountain to be absolutely inaccessible.

An hour passed pleasantly in friendly, cordial chat with the dignified, gentle old man and his companions, and as we were about to leave, the Chief rang his little bell for vespers, and for a short space there was silence, while with bared heads the Kootenays crossed themselves, and murmured to the Christian's God the prayers that had long ago been taught them by his ministers. So in years gone by, among a kindred race on the other side of the range, I have seen pass about through the camp the clear-toned crier, who summoned the people to their devotions, as when on the shores of the Bosphorus, clambering to the crescent-crowned spire

In St. Sophia
The Turkman gets,
And loud in air
Calls men to prayer
From the tapering summit
Of tall minarets.

Yo.

THE GULF COAST OF FLORIDA.

OFF for Tampa. How the heart bounds and the pulse thrills at thoughts of the bay of Espirito Santo. There were four in our party, the Colonel, the Professor and his wife, and myself. Arrived at Sanford we found the comfortable cars of the South Florida Road waiting for us, and were soon rolling through that garden of South Florida, Orange county, where every station is an orange grove, and every grove an Eden, if we may believe all the owners and real estate agents tell us. Of course we believe the latter; every one does that and we want to be in the fashion. Through Orlando, the county seat and the home of innumerable land agents, who are never tired of telling us of "big booms" and "tremendous bargains," till we dream of sudden riches in connection with every forty acres, without the mule; through Kissimee, where the big Disston Company have succeeded in building a town and reclaiming the waste places. Here we see the evidences of activity and enterprise. The ship yard and the steamers and the big dredges that have opened new channels and drained off the surplus waters of the big lake with the incomprehensible name. Away we speed and now we are crossing the backbone of Florida. In 1881 Captains Williamson and LeBaron, of the U. S. Engineers, surveyed a line for a canal from Lake Tohapelaliga to Charlotte Harbor via Pease Creek, through this country, and reported that for forty miles they found neither a house nor white man, and saw only a few straggling Indians and one Indian village, situated on Lake Pierce. Now there are over two dozen towns and a few cities scattered round loose, in all of which there are "big bargains" in corner lots and bonanzas in prospective orange groves. And at last we are at Tampa.

Jules Verne has rendered Tampa immortal by starting from here his heroes on their "Voyage to the Moon," which proves that Tampa is nearer the celestial regions than wicked scoffers would have you believe. They will show you the identical hill where his big projectile was shot off, if you find the right man for a guide. He had gone fishing when we were there, so we didn't see it. At present there are steamers here for Key West, Cedar Keys, New Orleans and all along the coast. The Gulf Steamship Company own and run the steamer Gov. Safford from Tampa to Palma Sola and all points on the Manatee River, and thence to Cedar Keys, connecting with the Florida Railroad and Navigation Company at that point for Jacksonville, Fernandina and Tallahassee. The Manatee runs to Punta Rassa and Fort Wyers, and connects at Punta Rassa with steamers for Key West. The Alice Washburn and Cumberland run from New Orleans to Key West, touching regularly at Mobile, Pensacola, Cedar Keys and Tampa, connecting them with the steamer Cochran for Havanna. The Gov. Safford is a fine large steamer; the Manatee is a trim little iron hull, side wheel boat, and makes regular trips. The Gulf of Mexico is generally calm and placid, and the trip on either of these boats is delightful. Then there is the little steamer Erie, which looks like an animated dry goods box, and which will take you to Palma Sola and all points on Manatee River, if you have plenty of patience and a fair wind.

The site of Tampa was first discovered by Narvaez, in 1526. It was rediscovered by H. B. Plant, in 1884, the prince of Florida railroads, who built the South Florida Railroad here from Kissimme, and it has been on a boom ever since. We found little knots of men on the corners of the streets with sticks drawing diagrams of their lots and "additions," and explaining the value of their property to attentive listeners, and the sound of the hammer and saw is heard on every hand. The tourist soon finds he is in a land of the tropics. He sees in the gardens the mango and alligator-pear trees covered with fruit, and finds in the stores and on the street corners swarthy-faced Cubans speaking the Spanish language, and offering for sale these fruits with sappodillos and green cocoanuts from Havana and the keys.

The Colonel and the Professor are anxious to be off down the coast, the former to try his new breechloader on the game that abounds on the keys and the latter to add to his cabinet of shels and specimens of natural history; so we board the steamer Manatee and are soon rapidly steaming down the beautiful Tampa Bay, which looks like an inland sea. We round the point at the entrance to Manatee River and steam up to Palma Sola, situated on the south side of the river, which is here $\frac{2}{3}$ of a mile wide.

Palma Sola, "the youngest and largest town in Florida," is a neat-looking little collection of white cottages, with a big hotel, on a high point of land overlooking the river and bay. The hotel and town also belong to Mr. W. S. Warner, who keeps a fine store on the wharf where camping parties can be supplied with all requisites of cruising or camping. We have made up our minds to stop here and charter a sailboat for a trip to Charlotte Harbor, inside the keys. We found at Palma Sola a number of large sailboats fitted up for cruising, and soon chartered the schooner Belle at a moderate price, with crew, and proceeded to lay in a stock of groceries and canned goods for the trip.

The next morning we go aboard and set sail down the

river on an ebb tide and are soon skirting the south shore of Tampa Bay, with Egmont lighthouse ahead and to the westward. We leave the bay and enter the pass between Sarasota and Tampa bays. Leaving the pass and Longboat Inlet on the west, we see stretching out before us for sixteen miles the placid waters of Big Sarasota Bay, a beautiful sheet of water four miles wide, with fine pine lands ten to fifteen feet high on the east side and the west protected from the Gulf of Mexico by Sarasota Key. Crossing the bay, we land near the southern end, on the east bank, at the little straggling settlement of Sarasota and go up to the post office, kept by Mrs. Abbe, for our mail, which we had given directions to be sent here.

In front of this place and across the bay to the westward is Big Sarasota Pass, an outlet from the bay to the Gulf. Our skipper tells us that this is a famous place for fishing, so we run across and are fortunate in arriving at low water. While the rest of us are preparing our lines and bait, the Professor's lady, with the children, go ashore and are soon busy picking up shells, which abound here. The beautiful Panama shell is plentiful here. You find them with their live tenant digging little furrows in the sand just above low water mark; also the handsome red conch, which can be caught imprudently taking an airing in the same locality.

The tide has now turned and is running in, and the waters of the narow inlet seem alive with fish and we are soon busy hauling them in. In many cases it is a question which will be hauled in, the fish or the fisher. The Colonel is trying to catch that prince of fishes, the beautiful silver-sided tarpon, and has baited his hook with a whole mullet. The water seems full of them as they rush about coming regularly to the surface to breathe like a porpoise, but they are wary biters and the Colonel is unsuccessful for a long time. At last, just as he is giving up in despair and thinking of trying for less noble game, his line is suddenly snatched out of his hands and cuts through the water with a zip as if a fish torpedo had been attached to it. Fortunately he has lots of slack line and has taken the precaution to fasten the end to a palmetto tree. We see him scrambling for the line that is uncoiling like lightning and soon he has it again and ties to check it. We know now what is on the end of it, for the noble fish leaps from the water fully four feet, its sides glistening like burnished silver, and shakes its head defiantly in mid-air. But the hook is fast and down he goes again, almost pulling the Colonel into the water, and he has to let the line run. Back and forth the monster rushes as if it would never tire. Such strength and impetuosity is seen in no other fish in the world, not excepting the lordly salmon. For fully an hour the Colonel played that fish, hauling and tugging, now gaining a few feet of line, then himself yanked down into the water up to his waist. We all stop our fishing and look on, offering encouragement and advice. "Pull him in." "Now you've got him." "Don't pull too hard; let him run," and so on. At last the Colonel begins to shorten the line. He thinks he has got him now, but whoop! off he goes again as if but just hooked. This is work I can tell you. The Colonel is getting tired. His face is red and his hands are cut and bleeding. We go to his assistance and the skipper comes with a harpoon. We have the fith now in shallow water and the skipper wades out and after many failures succeeds in striking him with the harpoon or lily-iron. And now he is off again, nearly as vigorous as before, but he has two lines this time to pull against, and faint from the loss of blood he is at last dragged on the beach. A noble fellow he proved—six feet four inches long—and shaped like a large shad. The skipper takes him in charge and proceeds to scale and dress him. The scales are 3x2¼ inches long and some of them larger and they have to be taken off with a hatchet. After this exciting episode the Colonel retires on his laurels and gives his attention the rest of the day to his hands.

The Professor and myself are content with smaller fry, and succeed in catching a *quantum sufficit* of mangrove snappers and the everlasting sharks. Some of the latter are lively fellows. We caught several four to six feet long, and it was only good fortune that saved us from hooking any larger ones. They played sad havoc with our lines, breaking them and straightening the hooks. We found it useless to attempt to fish without having the line well wired from the hook about three feet.

The Professor caught a fish about four feet long that looked like a cross between a haddock and muscalonge, which the skipper called a snoot or ravalle. We did not eat him, as the skipper said these fish had a flavor of turpentine. Well, we had fried fish and baked fish and broiled fish after that, and very nice we found the tarpon and snappers.

We had had enough fishing, so we took advantage of the flood tide and sailed back up the pass and into the bay again, and ran down the lower end, where we dropped anchor for the night on a flat with about four feet of water. In the morning when we turned out of our little cabin we found the crew had been up before us and had procured about two bushels of gigantic clams, which abounded on the flat where we anchored. They were similar to the quahogs of the New England coast, the *Venus solidissima*, and they were well named, for their shells might well be called solid, being fully one-half an inch thick, and they had to be opened with an axe. Many of them measured five inches in diameter, and although so large, we found them very good eating and no tougher than their smaller comrades.

That day we passed down through "The Mangroves," which is a labyrinth of mangrove islets, with overhanging branches, where the channels ended in the bushes, and the boat had to be poled through, the branches sweeping the decks. The Gulf Coast Canal Company will have to cut about half a mile here through the islands, about five feet deep. Then we entered Little Sarasota Bay, which is long and narrow and full of islands, reefs and oyster bars, through which only an accustomed pilot can find the channel. At Judge Webb's, on the east side, we stopped to post letters. This post office, Osprey, is the last post office until Punta Rassa is reached, on San Carlos Bay.

We found an abundance of fine oysters in this bay, and we learned a fact new to the Professor, which was that the oysters here are good at all seasons. That is the oyster is good, except when spawning, and different beds in the same bay have different spawning times, so while the oysters on one bar are poor and unfit to eat, on the next bar we found them fat and luscious. There were a few settlers on the east side of this bay, on the mainland, and the shores looked pleasant and inviting. The islands or keys all along this part of the coast have never been surveyed by the Land Department, and only recently by the Coast Survey, so most maps of the State do not show them, and an entirely new impression is given of this coast. Passing down to the lower end of Little Sarosota Bay we come to Casey's Pass, which is a small outlet to the gulf. Here we will have to go outside and make a run of fifteen miles in the Gulf of Mexico, past Horse and Chaise Point. Our skipper wishes to start early in the morning on this run, as that part of the day is generally best for outside sailing and less likely to be squally, so we anchor close to the bank just inside the pass, and improve the opportunity to go up to Mr. Higle's place on the point. Mr. Higle is an old man-of-war's man, who was for many years a sailor in the Coast Survey service, and has now cast anchor in this out of the way spot, where, with his wife and family of six boys, he enjoys a truly pastoral life.

We found he had a nice new house and a fine large orange grove, the trees covered with the golden fruit. Mr. Higle was a hospitable host and we soon felt at home, and while we were listening to his interesting anecdotes of life in this remote quarter the Colonel took his new gun, borrowed a dog from Mr. H. and started off in the woods, one of Mr. Higle's sons accompanying him. About sundown he returned with two wild turkeys, a raccoon and a wildcat. He reports a fine pine land country and says he was nearly run down by a couple of deer, which, frightened by the dogs, rushed out of a little bayhead thicket and nearly run over him. Of course his gun was loaded with bird shot just then and he had to let them go.

The beach here is sandy, the fine trees growing close to the edge, and the bluff is about eight feet high. Horse and Chaise Point is about a mile south, so-called by navigators from the fancied resemblance to a horse and chaise, when seen from a vessel several miles out in the gulf. On the beach here I found several fossilized bones of the fossil elephant (*Elephas columbi*), and Mr. Higle showed me some monster vertebra of the same animal, on a large Indian mound at the foot of his garden on Robert's Bay. These remains, with the fossil stag, bear, horse and monster turtle and manatee with sharks' teeth of the ancient *Plesiosaurus*, abound in the bed and banks of Peace Creek.

Casey's Pass is small and the water only about four feet deep on the bar. It is not much of a place for fishing compared with the other passes, but the beach is an excellent one for bathing, and we found it very warm and pleasant in the surf on the 25th day of January.

The next morning we are awakened before sunrise by the rattling of the sails and creaking of cordage as our sailors get under way and sail boldly out into the Gulf and steer south along the shore. The morning is bright and clear, and just cool enough to be pleasant and invigorating. The water is clear, and as we cross the bar we see hundreds of sharks rushing about. The Colonel throws out a long trolling line with a white rag on the hook, and soon has a little shark about three feet long which is hauled aboard and dispatched. Then he catches a jackfish which is a handsome, clipper-built fellow, two feet long, but not considered very good eating, so he tries again and this time it is a fine Spanish mackerel.

We get no more fish until just as we are crossing the bar to enter Stump Pass into Lemon Bay. Here the fish are numerous and we put two lines out, and as we rush rapidly through the water, impelled by a strong north wind, we have a lively time hauling in crevalle and also a few salt water trout. The tide is running out but we sail in against it, and are soon in smooth water round the point and anchor against a steep bank on the north side of the pass to wait for a flood tide. While waiting here the Professor and his family go on shore, and return laden with beautiful conchs, calico, Panama and pompons shells. The skipper takes his cast net and wades along the shore of the bars, and soon has a lot of fine mullet and that incomparable fish, the Southern pompano, esteemed by epicures as the best fish in American waters, always excepting the brook trout. The Colonel took the small boat and one of the crew, and rowed up among the Mangrove Islands in Lemon Bay, of which Stump Pass is the outlet, and we hear the report of his gun at frequent intervals. In the mean time I take my doublebarrel and walk up the beach, and soon have a large bag of plover, the godwits and greater yellow-leg snipe predominating, with a few killdeer plover and sandpipers.

When the Colonel returns he shows us two beautiful pink curlews, called by ornithologists the roseate spoonbill—a handsome reddish pink bird as large as a small turkey. He also has a number of herons and ibis, of which there is an endless variety. He saw several flocks of ducks, but did not succeed in shooting any.

When the tide turns we up sail and pass on south through a narrow channel just inside the beach ridge, past Bocilla Pass and Boca Nueva, and through the Narrows into Gasparilla Sound. Lemon Bay, that we have just quitted, is a fine sheet of water, interspersed with mangrove and palm islands, with pine lands, on the east side, and several fine cabbage palm hamak islands. There are only two settlers on the bay. One, Lopez, a Spaniard from Cuba, started, several years ago, a large lemon grove here which is now in full bearing. This bay was formerly known as Kettle Harbor, and it is currently reported that the old Spanish buccaneers buried a large treasure on its shores in olden times. Just where it was buried is unfortunately unknown, so we reluctantly abandoned for the present all thoughts of opening a new bank account and continued on our cruise, passing down Gasparilla Sound to the inlet of that name, which is large and deep. On the south side of this inlet we go ashore at a fishermen's camp on Gasparilla Island to get water. This is known as Cash's fish camp and consists of two palmetto cabins where the fishermen live with their families. They seem to be doing a good business, judging by the fishy smell that pervades the camp and the appearance of their large fishing boats.

Having replenished our water supply at their well, we keep on and are soon in Charlotte Harbor and sailing past the broad inlet for Pine Island Sound.

This harbor is just now assuming prominence. The Florida Southern Railroad are building their road to Punta Gorda, on the east side of the harbor, and intend to have a through line to Key West and the West India Islands, by means of steamers. Peace Creek empties into the upper end of this harbor. This "creek" is a river a hundred miles long, flowing down from Bartow and Fort Meade. Fort Ogden, a thriving town, is situated about eighteen miles from the harbor, on Peace Creek, and two new towns have been laid out on it, called Liverpool and Cleveland. Charlotte Harbor Post Office is situated near Hickory Bluff, at the mouth. Charlotte Harbor is large and spacious and perfectly landlocked, but will accommodate only vessels drawing about nine to ten feet at low water, and the tide rises only one and a half feet.

We are now entering Pine Island Sound. On the left is Pine Island, a long, rather low island on which several large cocoanut groves have recently been started, and the new city of St. James has been laid out there, which will be a great resort when the railroad and canal is completed, and a point for the shipment of cocoanuts. The island is surrounded by a flat salty level, called by the Spaniards the "Salinas." On the north end of the island the Florida Southern Railroad Company are surveying and cutting out the right of way of a branch of their road, which will give them a deep-water terminus. They cross Matlacha Channel to the island. There are several large Indian or pre-historic mounds on the north end and a lemon grove on the mounds. There is also an old pre-historic canal cut clear across the island, east from the mounds. What the purpose of its builders was is not very clear, but it was probably used for boats. There is another of these canals leading from Lake Flirt at the upper end of the Caloosahatchee River, about three miles long, to several large mounds in the pine woods. This canal is about eight feet wide and four feet deep, and the earth is thrown out on each side. There are large pine trees growing up in the bottom of it in places. How the pre-historic men who built these canals made them a financial success would be interesting to the promoters of the great Florida ship canal.

On entering Pine Island Sound we pass by several small but high and fertile islands—Mandorigo and Useppa on the left, the last a corruption of the Spanish Josepha, and Palmetto on the right. On these islands are several families of Dagos or Deigos, of the Spanish race, from the West Indies, who live by fishing and sponging. Their cosy-looking palm-thatched cottages peep out from among the cocoanut trees and oranges and lemons. There is a fine spring of clear water on Useppa, which is resorted to by all the fishing and sponging vessels in these waters. There are several fine little schooners engaged in gathering sponges. They are continually cruising about searching for new sponging grounds. To find the sponges they carry a "water glass," which is a tube a foot or so in diameter with a piece of common glass fitted in the lower end. Putting this in the water they are enabled to scan the bottom and detect the sponges, which are then hauled up by hooks fastened in the end of long poles.

From Useppa we have a pleasant sail of fifteen miles through Pine Island Sound and into San Carlos Bay, which we cross and arrive at Punta Rassa, a corruption of Punta Rosa. This is a low point of sand backed by a mangrove marsh, and has only two dwellings, the house of Mr. Jacob Summerlin, a Florida cattle king, and the house of the telegraph operator and signal service officer, who is also steamboat agent for several lines, postmaster, deputy customs officer, and keeps a store and billiard tables.

Punta Rassa is a shipping point for cattle to Cuba. The water is deep at the wharf, but the bar at the entrance of San Carlos Bay has only nine feet at low water. We see several fishermen's cottages on small islands in front of the landing, and to the westward looms up the tall lighthouse tower on Sanibel Island. This island, by the way, will well repay a visit, for on it are found the finest shells of any place on the coast, and the deer are numerous also, as indeed they are on Pine Island, the southern extremity of which is directly opposite. Several steamers stop at Punta Rassa regularly on their way between Key West and Tampa and Cedar Keys, and the steamer Manatee, of the Gulf Steamboat Company, stops here on her way to and from Fort Myers. The little beach here is covered; yes, actually covered with an army of fiddle crabs, at low water, which are perfectly gorgeous in their bright colors, red, yellow and purple. It is impossible to walk without treading on them. We laid up at the wharf here and had good sport fishing. We caught redfish, groupers, crevallie and jewfish. The first is excellent eating, and all of them are good. The jewfish run from 40 to 400 pounds. All along this coast from Cedar Keys to Punta Rassa there are excellent fishing grounds, off shore on ledges, where rare sport can be had catching red snappers and groupers, the former weighing from 20 to 40 pounds.

Punta Rassa is the southern terminus of the proposed Gulf coast canal, from Tampa, which passes through Gasparilla Sound, Charlotte Harbor, Pine Island Sound and San Carlos Bay, and is 160 miles long.

The Caloosahatchee River empties into San Carlos Bay about two miles above Punta Rassa. The Okeechobee Drainage Company have cut a canal 6½ feet deep and 46 feet wide from its headwaters, through Lake Flirt and Lake Hickpochee into Lake Okeechobee, and a steamer 150 feet long, the Bertha Lee, has passed up through the latter lake to the Kissimme River and up to Kissimme City.

This river has very fine, rich hamak lands on its sides, but they were subject to inundations twelve to thirteen feet deep. The canal of the Okeechobee Company has now stopped these overflows, and the lands are reclaimed and will prove very valuable for sugar cane and oranges, and the river banks are rendered inhabitable.

We all concluded to take a run up to Fort Myers, and on the following day we set sail and arrived there in the afternoon. We found a charming little village of about 500 inhabitants, with large stores, school house, church, masonic hall, etc. The town is regularly laid out and lots are selling rapidly. Schooners drawing eight feet come up to the wharves.

This is the residence of Captain Hendry, one of Florida's great cattle kings, and he and Major J. Evans are the fathers of the place. We were shown here the identical log cabin in which General Sherman lived when stationed here before the war, and a large date palm is pointed out as having been planted by him. This used to be a military post of some importance, but the troops have been long ago withdrawn and the name of the town changed to simply Myers. All that remains to show its former military occupancy is the General's cabin and the little military burying ground, with the headstones of some of the brave boys who were laid here.

We had now completed our trip, and we discharged our vessel and sent her back to Palma Sola, while we waited and lounged in the hammocks under the cocoanut palms for the arrival of the steamer Manatee to take us back to Tampa and the big world.

ARDEA.

A BRAY FROM BOONVILLE.—The Boonville *Herald* urges: "Bury beneath public contempt a newspaper like FOREST AND STREAM that purports to be a sportsman's journal and with a treachery unparalleled betrays the gentlemanly and genuine lover of the woods into the hands of the pot hunters. Their misrepresentations, their title of butchers to all who secured their venison by the chase, and their favorite mythical and farcical 'club' argument are worthy of a place in the library of the Pennsylvania pot-hunters and their coadjutors who have been so merciless in their slaughter of deer for 8 cents a pound. 'Pulverize the paltry pot-hunters' may also apply to such pernicious persons as the pencil-pushers of FOREST AND STREAM." Hi, hi!

CAMP FLOTSAM.

XX.—"WHOSE WATERLOO?"

WHEN we awoke, a hard wind was blowing from the southwest and, as the course to the lower outlet lay straight before it, there was a promise of sport on hand. We soon had breakfast over and the Madame ashore, when we found the preparations for the start well under way. Provisions and cooking implements were being stored on board the Sabbath Breaker and a group of three or four hardy hunters were lounging on the dock as we drew up and unloaded our freight. The kind-hearted skipper of our rival inquired whether we intended, in sober earnest, to attempt to cross the "big water" in our cockle shell, and warned us that with the amount of sail which we were getting ready to spread, we would drive the Pizen Ann under before we had gone two miles on our way. We were a little shaky, with the small gale blowing as it did, but we passed a rope under the sheathing in the stern, coiled the end at our feet in readiness for a capsize and determined to take the chances. Aside from a single rod, our outfit consisted of a pair of woolen and one rubber blankets, a hatchet and coffee pot. Our friends had provided more elaborately for themselves by putting on board a small tent; rent with many a seam and gash, an iron pot and a frying pan. A small basket in each boat contained the necessary groceries. It was close on to noonday before the Sabbath Breaker embarked her crew and pulled into the stream. With a long pair of sweeps she was worked up the creek, for, notwithstanding the tumult on the lake, scarcely a ripple was on the water about us, so completely were we sheltered by the forest on the left. We pulled slowly after the craft in front while we watched to see her come into the wind. Just out of the mouth of the creek her sweeps were pulled in, the sail filled and she stood off toward Burnt Point. She was well down toward the rock reefs before we had succeeded in getting into the wind and we were just beginning to make good headway when we found that my rubber coat was left in camp. We lost half a mile while dropping in for it and by the time we were back on our course the Breaker had passed through the narrow channel off the point and ran under the lee of Pensel Island, where she was waiting for us. Long before we reached this point, we were bowling along at such a rate that our rival thought it prudent to get under way before we came up. When we rounded the point and struck the "big water" she was doing her level best and was being worked by her skipper for all there was in her. The Pizen Ann shied, bucked and kicked like a trick mule at a circus, and for a few minutes we thought that she would resort to the same tactics of rolling over to dismount us, but we helped her by shifting ballast, kept up the peak and every inch of sail and headed right on after the Breaker.

It was a glorious sail, at least it seems so now viewed in the firelight of to-night, but it was nevertheless foolish and hazardous; the only excuse possible was that the water was warm and we were within half a mile of an island or the mainland at all times during the cruise. We shot along the bases of palisades of rock, across the mouths of coves radiant in their wealth of lilies, between close-lying islands crowned with pine which reached to the water's edge, and over wide open stretches of lake, bounding and jumping like a race horse, yet steadily closing the gap between us and the old sea goer in front. At Porcupine Island we were abreast of our rival, and then we steadily drew away, leaving her in our wake. We felt as one born out of due time, and in a burst of prophetic inspiration ventured to estimate how much we would beat her in the next three miles. Had it been six weeks later we would have grappled without hesitation with the conundrum, "Whose Waterloo?" proposed by the yachting editor of FOREST AND STREAM.

Between the high hills below the narrows, the wind failed us, and with a fair trolling breeze we led the Sabbath Breaker over the remainder of the course. In the broad water below, a spoon was put out and, though the rate of speed at which we were going was a trifle too fast for the best of luck, yet we took a couple of good-sized big-mouths, which were carefully put away as they might become our chief reliance for supper. So completely had the wind fallen that it was near the middle of the afternoon before we reached the lower outlet of Loughborough and entered the creek which flows into Hart Lake. On the left was the grassy bank on the trail leading off through the woods, up which with Truthful James we last summer carried our lunch and opened a noonday School of Philosophy, on the day when our journey to Hart Lake ended here on account of low water in the stream. Now, thanks to the wet Canadian summer, the stream was full, and down it we glided for half a mile between rocky shores overgrown with mosses and ferns, and beneath an arch formed by the great trees on either side which interlaced their branches over our heads. It was a grotto of beauty; below us through the clear water shone the white sandy bottom, and almost within reach with the oars hung festoons of green on which the sun never shone. The rocky sides sent back the echo from our boat and our voices sounded as though in a cavern. A short turn in the stream and the roar of a waterfall came to our ears. Through a narrow gorge in front the creek made a downward rush of twenty feet among rocks and boulders, sending up a shower of spray, through which the rays of the afternoon sun made all the colors of the rainbow. On the right, a shelving rock at the edge of the stream made a natural landing and on this we drew up our craft and waited for those in the rear. When they arrived we unloaded our slender baggage and two, taking our boat, started over the carry. There was scarcely the sign of a trail, so seldom was a passage to the upper lakes made. Of the party but one had ever been over it, and for the purpose of fishing no one. It was an easy walk through the woods and the carry ended on top of a high bank fifteen feet above the stream. It required some care to lower the boat while the passengers and carriers slipped and scrambled down by trees and rocks to the shore below. One by one, the three boats were brought over, the luggage followed and soon everything was replaced and we were again afloat.

It was a veritable Treboni—a sea of reeds, upon which we looked. In front was a basin stretching away for miles between high hills, at the feet of which an ancient lake had once rolled its waves. Here the bright waters had flashed in the sunlight and darkened before the storm, with no human eye to drink in the beauties of that strange world which was before the lake dwellers were, and which shone here in royal splendor long before the tertiary period began. On that July afternoon, it was as lonely and desolate as on the day, in that far off primary epoch, when the hills were rent asunder and the pent up waters began their rush to the sea through that mighty channel which but yesterday, as it were, John Cabot saw for the first and which will be the St. Lawrence forever.
